THE MARITIME FARMER

AND

CO-OPERATIVE DAIRYMAN

Official Organ of The Farmers' and Dairymen's Association of New Brunswick, The Nova Scotia Farmers' Association, The Nova Scotia, New Brunswick and P. E. Island Fruit Growers' Associations, The Maritime Stock Breeders' Association, The Maritime Bee-Keepers' Association and The Newfoundland Agricultural Board.

Volume 19. SUSSEX, NEW BRUNSWICK, OCTOBER 14, 1913. Number 1.

Yarmouth County Agricultural Exhibition

BEAUTIFUL autumn weather greeted the opening day of the Yarmouth County Agricultural Exhibition for the western counties, and despite the heavy rain and thunder storm on the second and third day, the big reputation which this exhibition has always had for excellence and attractiveness, coupled with special excursion rates from all points on the railway and steamboat lines centering at Yarmouth brought about a fair average attendance.

As this has been a very dry season, naturally one would not expect the exhibit of fruit, vegetables or stock to be quite up to the mark but with a very few exceptions everything was first class.

ADDITIONS AND IMPRONEMENTS TO THE BUILDING.

This exhibition is fortunate in having on its Board of Directors some of our most intelligent and successful farmers and business men with E. K. Spinney, Esq. as President and Mr. Wm. Corning, Secretary. Always alive to the growth and increasing importance of the Western Counties exhibition, they have annually increased the capacity of the plant. This year a large addition was made, 30x50 feet to the main building to serve as a machinery hall. The hall is well lighted, with large doors, and a concrete floor. The main bui,ding is thus relieved of the jar, vibration and smoke from the gasoline engines, and the heavy weight of automobiles and farm machinery. The upper storey is to be used for the Winter Short Courses, all of which have hitherto been given at Truro. Even with this increased accommodation the whole building was crowded with exhibits, many being turned away. If the stock show keeps on increasing, more yard room will have to be found.

THE FLOWER SHOW.

No doubt the most attractive exhibit, the centre piece of all, in the main building is the flower show with its wealth of colour and profusion of beautifu, foliage plants. Starting twenty-five years ago with one small table it has grown up to its present handsome proportions in charge of Mrs. Chas. R. Kelley. Of the two towering collections by professionals, the first prize was carried off by S. F Trask second by C. W. Durland. The one collection by an amateur, Mrs. Dr. I. M. Lovitt was fully up to that of the peofessionals. The wild flowers, four collections, cut flowers and collections of foliage plants were gorgeous. These, with the very large show of ferns, palms and flowers growing in beds made a display of wondrous beauty and whose fragrance filled the entire arena.

Chas. Grace and Wm. Butler, of Yarmouth were the judges.

VEGETABLES.

All the ordinary garden vegetables for table purposes with some newer varieties made a good showing. Pumpkins, squash, cauliflower, roots for stock were not so large in size as last year. Tomatoes, cucumbers, etc., were good. The showing of home grown seeds far excelled any previous exhibit.

The judges were Wm. Archibald, W. H. Allen, Geo. Moses, Chas. Doane all of Yarmouth.

THE SEED EXHIBIT.

Corn, beans, grains, cabbage and turnip was pronounced of such excellent quality, by the Dominion Inspector of Seeds, that where the quantity of any one kind exceeds 25 pounds they are to be recommended for the Dominion County at 25 cents per pound.

THE DISPLAY OF FRUIT.

The display of fruit was not so large as in some previous years. That shown was well up to the mark in size, color, shape and flavor. The Annapolis or Cornwallis valley is not the only part of Nova Scotia where fruit can be grown. In years gone, our native fruit, won prizes in open competition from Kings and Annapolis counties. Our apples keep better and we are free from the pests that are proving so troublesome in the better advertised apple growing sertions. For twenty years teachers in very many school sections in Nova Scotai have kept records of dates at which our wild flowers and fruit trees are "first seen" in blossom and "when blossoming has become common." This system is one of the many good things inaugurated by Dr. A. H. Mackay, Superintendent of Education.

These "Phenological Observations," as they are called, are published annually in the October Journal of Education. A careful study of these statistics will show that in our "Orchard-Farm Belt, spring opens earlier, blooms of all kinds are "first seen," "become common" earlier, and that the winters are less severe than in any other part of Nova Scotia."

Fruit growing conditions in the sheltered inland valleys, referred to, along the D. A. Railway, along the Carleton, Tusket and Salmon Rivers, in Deerfield, Pleasant Valley, Carleton, Kempt and other places are simply ideal.

There were some splendid exhibits in collections of apples for commercial purposes, apples in barrels and boxes and plates of all the well known varieties, such as Gravensteins, Russets, Pippins, King of Tompkins, Sweets, Spy, Fall Jennettings, Greenings, Wolf River and many others.

The exhibit of pears was not large but contained some fine Clapps Favorite, Bartlett, and Duchess and there were some good Lombard, Moore's Arctic and Burbank plums.

Mrs. Cail and Mrs. Dr. I. M. Lovitt had their usual fine collection of grapes grown under glass.

The judge in this section was G. H. Vroom.

DAIRY PRODUCE

was judged by W. A. Mackay.

The Yarmouth Creamery had a full and attractive display of creamery in boxes, crocks, 2 pound prints and fancy prints. In 1912-13 they have shipped about $40,200.00 of butter out of the county, and the price of butter and butter fat has increased about 30 per cent. The packages of "Hygenic cheese" made from buttermilk compares well with any fancy cheese on the market. This successful industry recently established in Yarmouth is in charge of Messrs. Porter and Chipman, Yarmouth County boys, Nova Scotia educated.

The exhibit of home made butter was in all respects equal to the creamery product, in some cases the points ran higher. Yarmouth butter is the product of Yarmouth's high grade dairy stock and is better than the best made elsewhere.

DOMESTIC MANUFACTURERB.

Judges, Mrs. W. R. Crosby, Mrs. Geo. A. Handy.

The exhibit was smaller than in former years but contained some excellent mats hooked from yarn and braided mats, patch work and fancy quilts, sox, blankets and homespun. The first prize for knitted quilt going to a lady 80 years old. One fancy hand-woven spread, that had been in use 75 years, would seem to indicate the durability of hand made goods.

BREAD AND PRESERVES.

Judges, Mrs. Cann and Miss Baltzer.

This was a very fine display n' tempting delicacies, and was much larger than for years, covering five large tables. It is to be regretted that the value of prizes is not commensurate with fine quality and appearance ol the exhibit. White bread, brown bread, corn cake, all kinds of cake, buns, pies, pickles, preserves, canned vegetables and eatables too numerous to mention, were a source of very favorable comment. There was one bottle of raspberries, put up in 1863, by Mrs. Capt. Amos Dennis that still looked good.

SCHOOLS.

Judge, Geo. D. Blackadar.

The exhibit of mechanical, free-hand and perspective drawing in pen and ink, charcoal, or colored crayons was excellent. Collections of the above by schools or individuals and specimens of writing including business forms and for penmanship, and maps are a credit to our schools and show the class of work carried on there. Some of the work is so good as to deserve a place in the fine arts department. The same is true of collections of named wild flowers and minerals. The work in manual training, hall chairs, tables, racks stands, boxes and of inlaying was a surprise to the adult carpenter. These two departments are a big improvement on former years.

FINE ARTS.

Judges, J. C. Creelman, Mrs. E. J. Vickery, Mrs. S. Crosby.

It is hard to do justice to the splendid exhibit in this department. The work was of very high class order. Both professionals and amateurs, in oils and water colors, in pen and ink or charcoal produced work of which

396367

they may well feel proud. Under the direction of Mrs. Lindsay Burrill the drawings and paintings were tastefully displayed on the walls and tables of the long gallery which was thronged with admiring spectators.

THE FANCY AND NEEDLE WORK DEPARTMENT

was judged by Mrs. Jas. Stoneman and Mrs. J. G. Burrill. Here also the display of silk on linen, laces, sofa pillows, sewing by children was well up to the mark and an object of much admiration.

HARDWARE, STOVES, ETC.

The two exhibitors in this class were the Burrill-Johnson Iron Co. and Mr. Alex. P. Ross. The former exhibited their own make of stoves made in Yarmouth. These stoves are well known for being durable, efficient and economical. They show such familiar makes as the Silver Moon base burner,which will give more heat with the same fuel than any stove made in Canada, and a large line of cast-iron ranges, parlor stoves, and stoves for vessels or fishing schooners. Their kitchen ranges, the Model Grand, Model Duchess and Model Queen are filled up with the latest improvements and have a very large sale.

Mr. Ross is agent for the McClary stoves and ranges, the well-known Pandora, Regina, Kootenay and Gladova, and the famous airtights. They make good the claims made for them that they are easy to operate, bake and cook perfectly, reduce fuel and increase comfort.

The Rub-Ber-Oid and Ka-Lor-Oid Roofing Company had a model cottage, covered with their celebrated fire-resisting, roofing composition, made of wool-felt, saturated with rubber gums. This roofing has withstood severe fire three years ago in Yarmouth and more recently at Truro, is durable and easy to lay. E. H. Cunningham was in charge of the exhibit.

Seven makes of cream separators were lined up on the raised platform around the arena. We have long known the perfect work done by the DeLaval and the Melotte. They are all good machines, every up-to-date farmer finds one a necessity. A selection must be a matter of some perplexity, for each machine has some specially good quality about it.

In machinery hall was a fine display of gasoline engines, sleighs, waggons and various machinery for making farming operations easy.

The L. M. Trask & Co., Halifax, N. S., handle chiefly the Ferro, heavy-duty, four cycle gasoline engine. "Better than steam," "The engine that mastered Niagara." This engine and Mr. Trask, the agent, are well and favorably known all over the Maritime Provinces and Newfoundland.

Mr. Clifford Kelley, Manager the Eastern Motor Company, exhibited a fine Ford Touring car, the only auto shown. Gasoline engines, a stationary engine, mounted on a truck operating a saw for cord wood or stove wood and a grain crusher.

The largest exhibit was that of Mr. Chas. O'Hanley. It deserves especial notice, as Mr. O'Hanley is a pioneer in gasoline engines in Nova Scotia, and his exhibit was one of the best ever seen in this province. In one large block was a group of four engines including the Stanley, the Bridgeport and the Adams. One of them was equipped with a gasoline transformer that enabfes it to burn kerosene, gasoline, alcohol or benzene or any combination of those fuels. Another had the Perfex all-in one, ignition system, the newest thing in ignition systems. absolutely water-proof, and was shown running under water. He has a stationary engine specially made for him, run by kerosene or gasoline for all farm purposes, fitted with a special hoisting devise that can be put to any commercial purpose on land or water. A 2 H. P. engine can be run for ten hours at a cost of 15 cents. Mr. O'Hanley is headquarters for motor-boat or motor-engine supplies and specialties and fittings of every kind.

BOOTHS, ETC.

In numbers and appearance, on the main floors and in the Gallery the booths were the finest ever seen.

The Yarmouth Electric Railway booth lighted with hundreds of small and large lights, parlor and hall lights suspended for inside lighting, larger ones for outside purposes,, with their many colored, softly modulated globes and reflectors formed a very pleasing, attractive exhibit. Here was an electric stove and the counters were cooking and other utensils of every variety for domestic purposes, all in full swing.

Wm. Lloyd Porter's booth displaying ladies' ready made cloaks, dresses, dress goods and a fine lot of furs in boas, muffs and claoks quite filled the eyes of the ladies.

The Nova Scotia Agricultural College's travelling booth with its exhibits of insects injurious to plants, with their life histories, and in the same way, a demonstration of how to kill farm weeds with a 3 per cent. solution blue visIiol without injuring the crops, was both interesting and educational. A. W. Penchard had a beautiful decorated booth in which he demonstrated the scientific fitting of eye glasses.

In the galleries, the refreshment booths and those of special exhibitors were handsome and artistic. Amongst the best we might mention those of R. H. Davis & Co., Printers and Booksellers; Porter & Robbins, The Reliable Shoeman; R. K. Smith, Wall Papers; W. N. Allan, Trunks, and Overcoats; The Real Lace Booth, Mrs. Bodger; The Domestic Science Booth, Miss Baltzer; The Yarmouth Herald, Printers Publishers, Bookbinders; Tip-Top-Tea; King Cole Tea; B. F. Trask's booth and Candy-made while-you-wait booths.

The fortune-telling booth conducted by Miss Eva Pelton, proceeds for the Yarmouth Hospital Society, was a source of much amusement to all who "dared their fate." Specially attractive was the "Children's Benefit Fund" booth, proceeds of which go to swell a fund being collected by Yarmouth ladies, the interest on which money is given to help secure proper treatment of sick children. This was best patronIled in the show and received a large sum for their kindly purposes.

Pianos and organs and piano players were represented by G. R. McNutt of Yarmouth, the Johnson Piano Company, of Halifax, and the Amherst Pianos Ltd. The latter being the only makers east of Montreal. Mr. McDonald, Manager. In the booth with McNutt was a display of Robin Hood flour, consisting of bread and pastries in every edible form.

These, with a small exhibit of salt and pickled fish, wooden pumps, yokes and a few novelties comprise about all that was interesting inside the building.

The stock yard presented an animated appearance, the attention of the large crowds being about equally divided with what was inside the building. Even in the pouring rain, daintily-gowned ladies in rubber surtouls showed their interest in this part of the exhibit. Who knows just how far the appreciation of the fair sex has helped to place Yarmouth's dairy stock so high.

Our largest breeders specialize on some particular breed that, for good and sufficient reasons, appeals to them. There is Dr. I. M. Lovitt, Proprietor of Lawndale Farm whose hobby is Shorthorn Durhams, beef cattle, Mr. H. W. Corning, M. P. P., of Chegoggin, breeds Guernseys for dairy purposes; J. C. Corning, the Cann Bros., of Chegoggin and S. A. Cook, of Cheboque, devote themselves to Jerseys for dairy also; Prickney Bros.. of Prickney's Point, have for their pets, the beautiful dark-red Devons, fine oxen stock whilst Osborne Churchill, of Ohio, raises Ayrshires for both dairy and beef.

All of thses herds have a reputation throughout the Maritime Provinces, where for years at the leading exhibitions they have carried off most of the honors, returning home with shields full of prize ribbons. But it must not be supposed that the above are the only ones who breed these high grade animals. In not a few instances first honors are won here by the smaller breeders, of whom there are many for Yarmouth is one of the best grazing counties in Canada. In addition to this there is the mixed breeds, the grades, some of our profitable dairy stock being of the latter variety and they are at the same time very hardy and easy keepers. All of tnis stock, sires and dams, old and young, looked in good condition. For the farmer can supplement shortage of pasture with short feed, though he can rarely supply lack of moisture for garden crops.

Working oxen were fewer in numbers than last year and steers, a big exhibit, with fat oxen, looked well.

The judges were John Corning, Edward Allen, Howard Hulsman, Wm. A. Killam.

SHEEP.

Judge, Nathan Lamont.

The sheep pens were fairly well filled with such well known breeds as Cotswolds, Shropshire, Cheviots, and the Merino-horned sheep. The competition was very keen. Some fine pens were shown by Chas. Butler, Chebogue, Rev. Gordon Lewis of same place and H. W. Corning, M. P. P.

SWINE.

were judged by the judges of the dairy cattle class, and were in splendid condition and made a fine showing, especially some brood sows with large liitters, fat spring pigs and boars. The breeds represented were Yorkshire, Berks, Chester White and Poland China. Amongst the larger exhibitors and prize winners were J. C. Corning, Chegoggin, W. A. Churchill, Hebron, Yar. Co., and H. W. Corning, M. P. P.

POULTRY.

Judge, W. H. Henry, Shubenacadie.

Though not over large the exhibit of hens, geese, ducks, game birds, pheasants, white rabbits was fairly representative. The fowls looked well and were up to standard. F. W. Pickles, of Hebron, Yar. Co., znd R. J. Melvin were the largest exhibitors in the class. One new breed of hens, the Campine, introduced this season from Ohio, U. S. nicknamed the "Egg machine" was a likely looking specimen. But all the old standard varieties, the Leghorns, Wyandottes, Brahmas, Plymouth Rocks, Rhode Island Reds, etc., have proven their egg-produsing qualities.

There was a single pair of turkeys. The show of ducks, Muscovey, Rouen, Pekin and of geese, Toulouse and Emden was the largest and finest ever seen in Yarmouth.

HORSES

Judge, Wm. Murray, Pictou.

Horses were well represented in all classes of Roadsters, Carriage Horses, General Purpose Horses and Light and Heavy Draught Horset. The number exhibited was larger, esptc.ially of colts. What was before noted about specializing on breeds of cows, holds true of the horses. There is hardly a scrub horse in the county. There has even been more improvementin the horse show than in any other part of the exhibition. The heavy rain prevented the usual display of driving so much enjoyed by everyone, but rains just now are good for everything but exhibitions.

By way of amusement there were the usual booths outside the rink where you shoot three balls for five cents or a poor cigar if you win.For inside entertainment was Yarmouth's fine concert band and the management provided two splendid specialities in the shape of a thrilling acrobatic and balancing performance on a revolving ladder and a troupe of trained dogs. The exhibition in itself is a diverting, entertaining affair. The management seem to estimate just how much move to add and the performers are the best it is possible to procure and the most suitable.

The 1913 exhibition has been altogether one of the most successful ever held in the Western Counties.

Under Ground Silos in South Dakota.

In the dry subsoil region of the great plains many underground or pit silos have been built and have proven successful. The authorities of the South Dakota Agricultural College have authorized Professor Larsen to expend $700 in an investigation of the pit silo. Several will be erected (if that is the proper term to describe the digging of a hole in the ground) in different parts of the state and records kept of the character of the subsoil and rainfall. This is agood move and some valuable facts should be forthcoming.

"It is a well established fact," says Professor C. Larsen, "that silos are the cheapest conservers of feeds for dairy cattle and young stock. The various kinds of silos placed on top of the ground require a considerable outlay of money. Many farmers, especially the new settlers in the western part of the state have not the means with which to build asilo nor possess the machinery for filling it. Realizing the great importance of silos and silage to the state of South Dakota, it was thought that the pit or underground silo would preserve the silage just as well as those erected on the top of the ground.

"Pit silos are comparatively cheap. Nearly all the cost of building such silos is represented in the cost of common labor. It is the intention to dig the hole or pit about 16 feet deep and make it about 18 to 20 feet in diameter, then plaster the inside with two coats of cement.

"The advantages of such a silo are: (1) that it is cheap, (2) that such a silo will not freeze in the winter, (3) such a silo will not blow down.

"The disadvantages are that: (1) more labor is required to get the silage out, (2) there is some danger of carbonic acid gas accumulating near the bottom of the pit. For this latter reason the experimental silos have not been dug deeper than 16 feet.

"The money authorized for these silos is from fcdetal funds. This is the first time that experiments have been conducted with pit silos. There are, however, a few underground silos scattered over the semi-arid portions of the United States."

The Cape Breton Island Exhibition

The Second Annual Cape Breton Island Exhibition was held in the Iron City, Sydney, on September 30 to October 4th.

The exhibition grounds had been considerably improved since last year but despite this fact the enclosure was taxed to its utmost capacity when on certain days of the fair the turnstiles recorded an attendance of upwards of twenty thousand people.

With a population ol upwards of 75-000 residing within a radius of twelve miles from Sydney, the majority of which are busily employed in the mining and manufacturing industries for which Cape Breton is noted and with ideal transportation facilities connecting the various industrial centres, Sydney makes an ideal spot in which to hold an exhibition.

People who are inclined to be rather skeptical about farming possibilities in Cape Breton receive their answer from the display made at Sydney by Cape Breton farmers.

At no exhibition that we visited this year was there a better display of well grown vegetables, fruits and grains, threshed and in the sheaf. In the latter class the sheaves outside the money's pale were better than some of the best prize winners at some of the earlier fall fairs. The vegetables and fruits were as various and well-grown as one can find anywhere.

The fruit was a potent reminder that, in many varieties, the Cape Breton counties are not a whit behind the best fruit growing sections of Nova Scotia.

Jno. McMillan, George's River and R. B. Murray, Coxheath had the first and second prize collections or seed.

D. R. Nicholson, Coxheath, had the best collections of field roots and garden vegetables.

Roy Martell, Mira, and H. A. Moffatt had the second and third prize collections of garden vegetables.

J. G. Davison, Baddock, showed the best collection of vegetables grown in Victoria County.

In fruits, the first, second and third prize collections of six varieties apples were exhibited by C. A. Munn. W. P. Meloney, North Sydney and M. D. Curry, Grand Mira South..

C. A. Munn had the best collection of fruit grown on one farm.

M. D. Curry and Jno. McMullin captured the second and third prizes in the latter section.

E. J. Johnson, Georges River, showed the best box of apples packed for market. John McMillan and D. Ferguson came in for the second and third prizes. C. A. Munn also had the best collection of plums. P. S. Lewis showed the second prize plum collection and that was shown by Roy third.

There was only one natural history collection andthat was shown by Roy S. Munn, Leitches Creek.

Mrs. Ira Hughes captured the red on the best collection of preserved fruit while Margaret F. Lewis, Point Edward, and Mrs, C. A. Munn, North Sydney, followed with second and third prize collections.

Mrs. C. A. Munn, Mrs. H. A. Moffatt and Mrs. F. T. Stewart showed the prize collections of jellies.

Mrs. E. J. Johnson had the only entry in the honey section.

The Cross Fertilizer Co. and the Nova Scotia Agricultural College had educational exhibits in the main builf ding.

The display made at Sydney of fancy and domestic work was simply grand, and no where could the work of Cape Breton women be excelled. In needle work as well as in the prbducts of the loom a high order of mechanical inginuity and artistic skill was in evidence.

The butter section in both the crocks or tubs sections and the rolls or prints sections were well filled and the quality tfhroughout was pronounced good by the judge, Mr. Harvey Mitchell, who recommended to the exhibitors that they use a better brand of butter parchment than they are now using. Prizes were awarded in the butter section as follows:—

BUTTER AND CHEESE.

Best Crock or Tub Butter—32 entries—1, Mrs. D. R. Nicholson, Coxheath ; 2, 7, N. Beaton, Coxheath; 3, Capt. J. C. McDonald, Baddeck; 4, E. J. Johnson, Geirges River; 5, Mrs. R. J. Gray, West Bay; 6, Robt. Grant, Pt. Edward. ...

Best Butter in prints— 45 entries—1. Mrs. R. D. Nicholson; 2, Jno. M. Guthro, McLeanville; 3, Mrs. John Harvey, Georges River; 4, Miss E. McMullin; 5, N. Beaton; 6, Miss Sarah McDougall, Xmas Island; 7, Miss C. Ferguson, Caribou Marsh.

Best Dairy Cheese—4 entries—1, Ira Hughes, Sydney River; 2, E. W. Andrews, Coxheath; 3, Rod McLeod, Glen Farm.

HORSES.

The two commodious horse barns were filled to overflowing and the overflow was housed in a large tent adjoining the barns.

J. Rufus Starr, Wolfville, N. S., placed the awards in the majority of the sections but as he had to get away to judge at Guysboro fair, Mr. S. A. Logan completed the task.

The draft classes are beginning to show up nicely at Sydney. Thanks to enterprising citizens who have imported and keep for service good, useful pure-bred sires, the young stock is particularly promising.

H. A. Moffatt's Baron Majestic by Baron Primrose carried off the sweepstakes awasd for the best pure bred draft stallion in Cape Breton following in second place by Matheson's Royal Everett by Flash Favorite, the winner of the Victoria County sweepstakes award. Baron Majestic was first with three of his get and his foals throughout the younger sections of the class were a credit to their owners as well as to their sire.

GENERAL PURPOBE HORSES.

were out in strong numbers and there was an abundance of quality. In some sections there were upwards of twenty entries and it was no easy task to place the awards. Baron and farmers' Pride foals were the principal money winners in the younger sections of the general purpose class.

John H. Ross, Marjorie Harbor, had the best general purpose horse owned in Inverness county. M. E. McNeil, Irish Cove, captured the Richmond county prize in the same se.tion while the Cape Breton county prize went to John Morley, Sydney.

CARRIAGE HORSES

were also out in strong numbers. Leland F., exhibited by Frank Redding, Sydney, Alice Snell, exhibited by G. V. Purvis and a Hackney stallion exhibited by Alex Jamieson, Sydney were the first, second and third prize winners in the aged stallion section. Leland F. was awarded the Cape Breton County sweepstakes prize for best carriage stallion, any age.

ROADSTER HORSES.

The aged stallion section of the roadster class had five entries. The Standard bred stallions, Directum B. and Royal Seal came in for the first and second monies and the Thoroughbred stallion, Dixiline, captured the third. The other two stallions could not show any proof of their breeding and they were ruled out of the Pure bred class. Dixiline captured the award for best Roadster stallion in Richmond county while the Cape Breton county award in the same class went to Directum B. The mares and geldings shown in the roadster class were a good, classy lot and outside the prizes were found horses that would be creditable winners at shows claiming greater pretentions than Sydney.

BEEF CATTLE.

There were no pure bred beef cattle at Sydney but there were a few grade beef cattle, none of which were very well fitted for the show. S. A. Logan placed the awards.

DAIRY CATTLE.

S. A. Logan, Amherst Point, N. S., placed the awards in the dairy cattle section and he was kept busy every minute.

There was a big showing of Holsteins. Some of the champions at the provincial fairs during the last three seasons were there in the hands of the most progressive farmers. Cape Breton, Richmond and Victoria counties were represented by exhibits in black and white.

As will be seen by the winnings elsewhere in this issue, D. R. Nicholson captured the lions share of the prizes. His Bob Dorindo captured the male championship, all breeds competing, and Cape Breton county award for best Holstein bull, any age.

The Richmond county award for best bull went to W. C. McLeod & Sons, Loch Lomond West, on Vale Imperial 2nd, shown in the senior calf class. John A. McDonald, Middle River, captured the Victoria county award in the same section.

C. A. Munn, A. K. Jackson & Son, The Cross Fertilizer Experimental Farm, W. Drysdale, The North Sydney Agricultural Society and R. T. McDonald were the other prize winners in the Holstein class.

AYRSHIRES.

Four counties were represented by Ayrshies, as follows:—

Inverness county, John H. Ross, Margaree Harbor; Victoria county, H. C. Rose, Baddeck; Richmond county, Wm. Chisholm, Loch Lomond and Cape Breton eounty, South Bar Agricultural Society, H. C. Musgrove, North Sydney, M. W. Ross & Son, Centerville; Chas. Barrett, Mira Rd.; The Cross Fertilizer Experimental Farm; Alex Boutilier; Blackett's Lake; Georges River Agricultural Society; East Bay Agricultural Society and Xmas Island Agricultural Society.

The class showed a great improvement since last year. In it we saw some imported stock and also a lot of good individuals from some of the large herds on the Mainland.

The honors for best bulls from the respective counties were won by the first mentioned names in the above list. The championship went to the two-year-old, South Bar bull, Tariff.

JERSEYS.

Cape Breton was the only county represented by Jerseys. Nevertheless, the representaion was good and to this breed belongs the honor of producing the sweepstakes cow, any age or breed....This honor was captured by by J. Webster Allen's aged row, Lady. Mr. Allen's Sensation was first with two of her progeny. H. A. Moffatt's Sydney Fox captured the male championship.

Donald Johnson, Leitches Creek, D. R. Nicholson, A. K. Jackson & Son and M. W. Ross & Son were the other exhibitors in the Jersey class. As in the other breeds, Cape Breton farmers have improved their herds very materially during the past year or two and ere long we expect to see large herds of this popular breed in the Cape Breton counties.

GUERNSEYS.

Cape Breton county farmers, particularly those residing in the vicinity of North Sydney and Coxheath have long been admirers of the Guernsey cow, and for years they have been keeping pure bred Guernsey sires they have also started in with a few pure bred females and in the course of a few more seasons we expect to see the Guernsey herds very much increased in numbers as well as in the size of the herd. Murdo McKenzie, Coxheath, R. M. Jackson, North Sydney and E. J. Johnston, Georges River have all made a good start in the breeding of pure bred Guernseys. Mr. McKenzie captured the male championship on his two-year-old bull as well as the female championship on his three-year-old dry cow.

A. W. McDonald, South Cove, showed the Victoria county sweepstakes bull.

GRADE CATTLE.

We belieue that never before in the history of Maritime Exhibitions, provincial or otherwise, was there a better showing made in the grade dairy classes than was made at Sydney. Some sections had upwards of a quarter of a hundred entries and there was quality to burn .

S. A. Munn had the best grade cow, any age, the winner of the first prize in the grade section of the 1912 dairy test at Amherst Winter Fair. We also saw the second and third prize winners in the same test. When it comes to get a good dairy cow the Cape Breton farmers are not afraid to invest their money in individuals that have been tried and found not wanting.

THE SHEEP CLASSES

were also judged by S. A. Logan. There were a few Leicester rams, a small exhibit of Cheviots, some good Southdowns and a good display of Shropshires and Oxfords.

E. J. Johnson's Oxfords captured the Cape Breton county sweepstakes award for best pen of pure bred sheep. This flock also captured the C. P. Moore special prize, a cabinet of first-class carpenter's tools.

Mr. Johnston also captured the Kirk and Torey special prizes for best ewe and best ewe lamb. Cape Breton is a good sheep raising county and the Sydney exhibition is bound to stimulate an active inteeest in better stock.

SWINE.

S. A. Logan judged the swine classes at Sydney.

There were some good Berks, Yorks and Chesters. The Cape Breton county sweepstakes for best pure bred herd was won by Ira Hughes' Chesters.

All the swine at the fair were exhibited by Cape Breton county farmers with the exception of a nice quartet of Berkshires shown by A. D. McCuish, Loch Side, Richmond cgunty.

See the list of prize winners in the respective sections elsewhere.

(Continued on page 10.)

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents 2 inches—First insertion $1.50; 3 inches—First insertion $2.25.

DATES OF ISSUE.

October 14-28
November 11-25

THE MODERN TORMENTOR.

"Frequently we meet breeders of live stock who protest against the work that is imposed upon them in answering letters of enquiry for stock. The most earnest of these protests come from men who, after answering enquiries, have not been successful in making sales. Some breeders who have advertised widely and who have answered scores of letters without making a sale are convinced that there is a large class of people who answer advertisements as a means of killing time. Down south, the darkies give a man his social rating on the basis of the amount of mail he gets, and as a consequence the south is celebrated for the number of enquiries it can produce for a catalogue proposition. That the south's standard of social importance is held by some people in the north seems to be a conclusive fact.

But what can we do about it? A suspension of advertising would mean an army of unemployed publishers, editors, printers, mail carriers, etc., who no doubt would be useful in the harvest fields this time of the year, but who would have to find other employment later on, and who would literia
would literally be forced into the publishing business when the long nights overtake us, in order to save the populace from mental atrophy.

"It would seem that this practice of answering advertisements witnout any intention of buying is a new form of expression of an old inherent trait. In barbaric days such a trait would find expression by puncturing a neighbor's skin with a bramble switch or a wreath of thorns. Later verbal taunts, backed by physical prowess, became a popular form of torture or amusement, depending upon the relative positions of the parties engaged. And now in these depraved decrept days we see the same old trait finding its expression by the use of the pen and His Majesty's mails. So the remedy is by no means simple. But we appeal to the man who is tempted to write in answer to an advertisement simply out of curiosity, to consider the trouble he may be giving some one and to curb the inclination. And by the same token, we urge upon anyone who feels the impulse to buy as a result of reading an advertisement to immediately write the advertiser, sending the money if possible, but in any event mentioning this paper."

The foregoing from the columns of an exchange is passed along to our readers and if the cap fits any of them we trust theywill take the hint and govern themselves accordingly. Don't bother the advertiser unless you mean business when he quotes a satisfactory proposition.

KEEP EVERYTHING WORKING.

It has been recognized by business men that everything must be kept at work if an enterprise is to prosper. Loafers will kill any business in the long run. The business of farmers is no exception. Unfortunately, definite rules are not as easily worked out for farm operations as for many other kinds of work, but as knowledge accumulates it becomes easier and easier to establish general principles of this kind. One farmer called attention to the fact that about the first of September a great many hens in a poultry plant either cease laying or do not lay enough eggs to pay for their feed. He advises immediate sale unless there is some especial reason for keeping them for the remainder of the season, for so far as these hens are concerned failure to sell will result in loss. Dairymen recognize that unless a cow produces during the season more than enough salable product to pay for her keep, which includes interest on the investment, she should be disposed of. Any animal which ceases to be profitable ought to be sold immediately, unless for some sentimental reason or other it is to be retained. This failure to keep everything working is a terrible handicap for agriculture. It will never be possible, of course, to determine just what animals are profitable until comparatively accurate records are kept. The up-to-date farmer is doing this and he must do it more and more. A field which does not produce enough grain to pay the interest on theinvestment, the cost of production and then some, must be so treated that it will show this profit. All these things require thought and study. It makes it necessary for the farmer himself to do less manual labor and work harder with his brain. In the long run, it will be found that brain work is much more profitable than manual labor. It will also be found that it is more wearing, but the combination of the two works very nicely.

A LONG COURSE IN AGRICULTURE FOR PRINCE EDWARD ISLAND.

The P. E. I. Provincial Department of Agriculture is arranging for a long course in agriculture this winter to be held in Charlottetown. It will begin about the middle of November and will be concluded early in April. The subjects included in the course will be Animal Husbandry, Horticulture, Dairying, Poultry, Agronomy, English, Mathematics, Book-keeping, Chemistry and Economics. The practical work will be given in the Agricultural Building, and provision is being made for live stock of all the different classes and breeds, etc. The lectures will be given in Prince of Wales College. A competent staff is already in the Province, and the course will be quite equal to any First Year's Course in Agriculture given at any of the Agricultural Colleges. A limited number of students only can be taken for the first year, not more than forty-six, as some of the rooms are built and equipped to accomodate just this number. To assist and encourage students to attend this course a small scholarship will be granted each pupil upon recommendation of the Principal of the School of Agriculture, stating that the pupils have attended their classes regularly and have completed their work in a satisfactory manner. It is intended to accept applicants in the order in which they are received, but no applications will be received from boys under 18 years of age. Further information can be had from the Department of Agriculture, Charlottetown.

FARMERS' UNIONS NOT TRUSTS.

The difference is very clear between illegal trust and associated effort which is morally and legally right. If certain farmers unite to ship their produce in an endeavor to secure a fair union prevents other farmers from selling their produce unless they join it or pay a tax to it, that is an illegal restraint in trade. Labor may associate in a union to secure fair wages by proper means—that is co-operation; but if the labor union stops non union men from work, it commits the crime of restraining trade.

SHOW HIM THE OTHER SIDE.

At the Rural Improvement Conference held in Indianapolis and promoted by the Indianna State Bankers' Association, a new angle was put on the much discussed problem of keeping the boy on the farm. "Show the country boy the other side of city life," said A. B. Graham, of the College of Agriculture, Ohio State University. "All he sees is the side which seems to him attractive —the good clothes, the change, the excitement," continued Mr. Graham. "If he saw the meaner side of the city life—the hard work, the heat, the poverty—he would realiIe more fully the fact that every occupation has its hardships and no one kind of work is all pleasure." The speaker said that too long we have described life on the farm in glowing terms when the boy knew better. He advised taking the boy on trips to the city, so that he may become familiar with the every day unpleasant side of city life which corresponds to the side of farm life with which he is so familiar.

SYSTEM IN BREEDING.

One great trouble with the people who are raising poultry today is the lack of system in breeding. Careful breeding and selection is necessary if one hopes to ever make a success in poultry raising. Select and breed from the individuals which come up to a certain standard of egg production or size, rather than from the entire flock, as most people who are raising chickens are inclined to do at the present time. The application of the laws of breeding is essential to success with any kind of live stock. This important matter is too often overlooked, and as a result many failures are recorded that otherwise would have been listed under the head of success.

A poultry farm, rightly conducted, operated by a man or woman with a reasonable amount of experience, common sense and judgement, will pay as well as most any other business for the actual amount invested. There are thousands and thousands of people in this country making a comfortable living raising poultry.

THE OLD-FASHIONED FATHER.

What has become of the old-fashioned father, with a hand like a sugar-cured ham, who used to spank a wayward son until he had to stand up at his meals for a week? Owing to the degenerate trend of these effeminate times, spanking has become a lost art. It has been succeeded by moral suasion and the power of love. Well, moral suasion is a good thing to have about the house, like an assortment of pink pills, but there are times when nothing will reach the spot with so much force and earnestness as a sound, six-ply spanking, applied in a cool, calculating spirit. For instance, when a boy gets in the habit of staying out all night trying to fill an inside straight or seeing who can lap up the most beer in passing a given point, moral suasion will do him about as much good as reading the 36th chapter of Genesis to him.—Kimball's Dairy Farmer.

ADVERTISING APPLES.

The essentials of success in an apple advertising campaign are: First, quality; second, uniformity of pack; third, a conspicuons and attractive identification label; fourth, advertising which makes a special point of the quality and the label. If an association would move along those lines, it would do more to increase the consumption of apples, and at the same time educate orchardists in proper and necessary methods, than is possible by indiscriminate advertising.

STOP THE SMALL LEAKS.

The farmers today is wise who watches all the corners for losses and the small leaks. This man is always looking to see that every foot of ground on the farmstead is producing something. He is always glad if someone can offer a new suggestion. The farmer who watches the little things usually has money in the bank, and has nothing to complain of except the low rate of interest paid. The man who does not watch the small leaks is not willing or ready to learn. He is still worrying over the mortgage and the high rate of interest he has to pay.

Chatham Exhibition was the Best Ever

The Miramichi Exhibition, held from the 23rd to the 26th of September eclipsed all previous records. It was the best that Manager Fisher has yet given to the public and that is saying a lot. The show went along without a single discordant note and those who attended as exhibitors and spectators had nothing hut good words to say.

The exhibits were numerous and the quality was good. The stock classes were well filled and there was keen competition for the honors.

In the agricultural sections the display was attractively arranged and was much admired. The horticultural show was also good. On the manufacturers side of the fair there was a fine representation of many of Canada's leading makes of agricultural implements and other wares.

The judging was, on the whole, satisfactory and few complaints were heard. Manager Fisher made things pleasant for the big crowds and for those who were showing. While he was highly praised on all sides for the smoothness that marked the exhibition, the stock men added to their spoken gratitude by presenting the genial head of the Miramichi fair with a heautiful walking stick. The gift will serve to remind Mr. Fisher of one of the pleasant incidents in connection with the many hours of hard work he has done to hring the Chatham exhibition to its present high standard.

The prize winners at the fair were as follows:—

HORSES

THOROUGHBREDS.

Stallion, 4 years and up—1, Wm. Jamieson, Sussex.

Stallion, any age—1, Frank Myers, Sussex.

HACKNEY.

Stallion, 1 years old—1, R. A. Snowhal,, Chatham, N. B.

Stallion, 3 years old—1, Randolph Cox, Loggieville, N. B.

Stallion, 2 years old—1, R. L. Hawks, Bartibouge Bridge.

Stallion, 1 year old—1, M. Woods, Reynolds, N. B.

Stallion, any age—R. A. Snowball.

Filly or Gelding, 3 years old—1, R. A. Snowhall.

Foal of 1913.—1, R. A. Snowhall; 2, Wm. M. Johnson, Chatham Head; 3, Micheal Woods.

Brood Mare—1, Wm. M. Johnson; 2, R. A. Snowball; 3, Micheal Woods.

STANDARD BREDS.

Stallion, 3 years old—1, George Hudson, Rexton, N. B.

SPECIAL PRIZES.

Silver Medal for best Stallion, hackney, won hy R. A. Snowhall.

Silver Medal for best mare, hackney, won hy Wm. M. Johnson.

MEDIUM DRAFT HORSES.

Brood Mare—1, W. D. Main, Rexton, N. B.; 2, Keating Bros., Chatham; 3, George J. Dickson.

Mare or Gelding, any age—1, Creighton Bros., Chatham; 2, Donald Walting, Block River, N. B.

Mare or Gelding, 3 years old—1, Keating Bros., Chatham, N. B.

Mare or Gelding, 2 years old—1, J. Mac. O'Brien, Nelson, N. B.; 2, A. G. Dickson, Chatham, N. B.

Yearling Gelding or Stallion—1, Geo. E. Fisher.

Foal of 1913—1, Geo. J. Dickson, Chatham; 2, Hotel Dieu, Chatham.

Brood Mare with Foal—1, Geo. J. Dickson, Chatham; 2, Keating Bros., Dickson, Chatham; 2, Keating Bros.; 3, Hotel Dieu.

Matched team—1, R. A. Snowhall.

HEAVY DRAFT HORSES.

Brood Mare—1, R. A. Snowhall.

Mare or Gelding, any age—1, R. A. Snowball.

Mare or Gelding, 3 years old—1, Rf A. Snowhall.

Mare or Gelding, 2 years old—1, Donald Walting;2, W. S. Loggie & Co., Chatham.

Yearling Filly—1, R. A. Snowhall.

Foal of 1913—1, R. A. Snowball; 2, Hotel Dieu.

Brood Mare—1, R. A. Snowhall; 2, Hotel Dieu.

Matched team—1, R. A. Snowball.

SADDLE HORSES.

Mare or Gelding—1, Fred Corwell, Chatham, N. B.;2, W. W. Doherty, Rexton.

Military Saddle Horse—1, John Hamilton, Chatham.

CARRIAGE HORSES TO HALTER.

Brood Mare—1, Micheal Woods.

Filly or Gelding, 3 years old—1, H. S. Pipes & Son, Amherst.

Filly or Gelding, 2 years old—1, Arch Cameron, Black River, N. B.; 2, M. Leorle, Chatham; 6, Frank Jardine, Chatham.

Filly ar Gelding, 1 year old—1,William Irving, Chatham; 2, Frank Jardine; 3, M. F. Noonae, Chatham.

Foal of 1913—1, A. P. Harrieman, Chatham; 2, Micheal Woods; 3, W. D. Main.

Brood Mare—1, Wm. M. Johnson; 2, Micheal Woods.

Gelding or Mare—1, W. W. Doherty, Chatham; 2, Fred Corwell; 3, Jas. Lomont, Chatham.

Matched team—1, Mrs. David Smith, Chatham.

Under 1000 each—1, Fred Corwell.

Mare or Gelding, driven hy a lady —1, W. W. Doherty; 2, Fred Corwell.

CLYDESDALES.

Stallion, 4 years and up—1, R. A. Snowhall; 2, H. R. McMonagle, Sussex.

Stallion, 3 years and up—1, Wm. O'Brien & Son; 2, Geo. E. Fisher.

Stallion 2 years old—1, J. Mac O'Brien:

Stallion, diploma—R. A. Snowhall.

Filly or Gelding, 3 years and up—1, R. A. Snowhall; 2, Wm. O'Brien & Son; 3, Wm: Johnson.

Filly or Gelding, 2 years old—1, H. S. Pipes & Son; 2 and 3, R. A. Snowball.

Filly or Gelding, 1 year old—1, R. A. Snowhall; 2, H. S. Pipes & Son; 3, Wm. O'Brien & Sons.

Foal of 1913—1, R. A. Snowhall.

Brood mare—1, R. A. Snowball.

PERCHERONS.

Stallion, 4 years and up—1, Wm. Jamieson; 2, P. S. Bremmer, Chatham.

Stallion, 3 years old—1, Chas. Symes.

Stallion, 2 years old—1i W. D. Main.

Stallion, any age—1, Wm. Jamieson.

Filly or Gelding, 3 years—1, W. D. Main.

Filly or Gelding, 2 years—1, Chas. Symes.

Foal of 1913—1, Chas. Symes.

Brood Mare—1, Chas. Symes.

The special prizes donated hy Dominion Clydesdale Association for hest Stallion, best Mare and hest Filly or Gelding were all won hy R. A. Snowball.

P. S. Bremmer silver medal for hest foal of 1913, for mare sired hy his stallion "Couquet" was won by George Dickson.

Special prize donated hy R. A. Snowball for progeny of Baron Balgreggan, for Mare or Gelding foal 1911 was won by A. G. Dickson, and Mare or Gelding foal of 1912 won hy Geo. E. Fisher.

CATTLE

AYRSHIRES.

Bull, 3 years old—1, McIntyre Bros, Sussex, N. B.; 2, Black River Agr. Society.

Bull, 2years old—1, A. McRae & Sons;2, McIntyre Bros.; 3, Harold McKendy, Bhatham.

Bull, senior yearling—1, AMcRae & Sons; 2, McIntyre Bros.; 3, Millon Galloway, Chatham.

Bull, junior yearling—1, McIntyre Bros.; 2, Chas. Symes; 3, Donald Walting.

Bull calf, senior—1 and 2, McIntyre Bros.; 3, A. McRae & Sons.

Bull calf, junior—1, McIntyre Bros.

Bull, diploma—McIntyre Bros.

Cow, 4years and up—1, 3 and 4, McIntyre Bros.; 2, A. McRae & Sons.

Cow, dry, 4 years and up—1, McIntyre Bros.; 2 and 3, A. McRae & Sons.

Cow, 3 years old—1 and 3, McIntyre Bros.; 2, A. McRae & Sons.

Cow, dry, 3 years old—1, A. McRae & Sons.

Cow, 2 years old—1 and 2, A. McRae & Sons; 3, McIntyre Bros.

Heifer, 2 years old—1, McIntyre Bros.; 2, Hotel Dieu.

Heifer, senior yearling—1 and 3, A. McRae & Sons; 2, McIntyre Bros.

Heifer, junior yearling—1 and 2, McIntyre Bros.

Heifer calf, senior—1 and 3, A. McRae & Sons; 2, McIntyre Bros.

Heifer calf, junior—1, McIntyre Bros.

Champion female—1, McIntyre Bros.

Aged herd—1 and 3, McIntyre Bros; 2, A. McRae & Sons.

Breeders' young herd—1, A. McRae & Sons; 2 and 3, McIntyre Bros.

Bull and 3 of his get—McIntyre Bros.

Cow and 2 of her progeny—McIntyre Bros.

SPECIAL PRIZES.

4 animals, get of one sire—1, A. McRae & Sons; 2, McIntyre Bros.

4 animals, produce of one cow—1, A. McRae & Sons; 2, McIntyre Bros.

HOLSTEINS.

Bull, 3 years old—1, Harding Bros., Welsford, N. B.; 2, A. L. Hinton, Bathurst, N. B.

Bull, 2 years old— 1, W. S. Harding, Welsford.

Bull, senior yearling—1, Harding Bros.

Bull, junior yearling—1, Harding Bros.

Bull calf, 12 months—1, Harding Bros.

Bull calf, under 6 months—1, Harding Bros.; 2, W. S. Harding.

Bull, any age—Harding Bros.

Cow, 4 years and up—1, Harding Bros.; 2, W. S. Harding.

Cow, 3 years o,d—1, Harding Bros.; 2, W. S. Harding.

Cow, 2 years old—1, Harding Bros.; 2, W. S. Harding.

Heifer, 2 years o,d—1, Harding Bros.; 2, W. S. Harding.

Heifer, senior yearling—1, Harding Bros.; 2, W. S. Harding.

Heifer, junior yearling—1, Harding Brso.; 2, W. S. Harding..

Heifer calf, senior—1, Harding Bros.; 2, W. S. Harding.

Heifer calf, junior—1 and 2, Harding Bros.; 3, W. S. Harding.

Champion female—Harding Bros.

Aged herd—1, Harding Bros.; 2, W. S. Harding.

Breeders' young herd—1, Harding Bros.; 2, W. S. Harding.

Bull and 3 of his get— Harding Bros.

Cow and 2 of her offspring—Harding Bros.

GUERNSEYS.

Howard Corning, Cheggogin, N. S., won all in this class, R. R. Black winning second prize on junior hull calf.

JERSEYS.

H. S. Pipes & Son won all the prizes here with the exception of a 2-year-old bull, which was one by R. A. Snowhall, who also won second in dry cow section.

SHORTHORNS.

Bull, 2 years old—1, J. B. Snowball; 2, I. M. Lovitt.

Bull, junior—1, Jno. T. Burchill; 2, J. B. Snowball.

Bull calf, senior—R. A. Snowball.

Bull calf, junior—I. M. Lovitt; 2, J. B. Snowball.

Bull, any age—R. A. Snowball.

Cow, 4 years and up—1, 2 and 4, I. M. Lovitt; 3, R. A. Snowball.

Cow, 3 years old—R. A. Snowball.

Cow, 2 years old—1, I. M. Lovitt; 2, R. A. Snowhall.

Heifer, senior yearling—1, R. A. Snowball; 2, I. M. Lovitt.

Heifer, junior yearling—1, I. M. Lovitt; 2, R. A. Snowball.

Heifer calf, senior—1 and 2, Snowball.

Heifer calf, junior—1 and 2, I. M. Lovitt.

Champion female—R. A. Snowhall.

Aged herd—1, R. A. Snowball; 2, I. M. Lovitt.

Young herd—1, I. M. Lovitt; 2, R. A. Snowball.

Bull and 3 of his get—I. M. Lovitt.

Cow and 2 of her offspring—1, M. Lovitt.

HEREFORDS.

Bull, 3 years old—1, A. Bradshaw, Amherst; 2, Wm. O'Brien, Windsor Forks.

Bull, 2 years old—1, Wm. O'Brien.

Bull, senior yearling—1, Wm. O'Brien.

Bull, junior yearling—1, A. Bradshaw.

Bull calf, senior—1, A. Bradshaw.

Bull calf, junior—1, A. Bradshaw; 2, Wm. R. White, Fort Lawrence.

Bull, any age—A. Bradshaw.

Cow, 4 years and up—1 and 4, A. Bradshaw; 2, Wm. O'Brien; 3, Wm. R. White.

Cow, 3years old—1, 2 and 3, A. Bradshaw; 4, Wm. O'Brien.

Cow, 2 years ald—1, A. Bradshaw; 2, Wm. O'Brien.

Heifer, senior—1, A. Bradshaw; 2, Wm. R. White; 3, Wm. O'Brien.

Heifer, junior—1, A. Bradshaw; 2, Wm. O'Brien; 3, Wm. R. White.

Heifer calf, senior—1, Wm. O'Brien; 2, A. Bradshaw; 3, Wm. R. White.

Heifer calf, junior—1, Wm. O'Brien; 2 and 3, A. Bradshaw.

Champion female—A. Bradshaw.

Aged herd—1, A. Bradshaw; 2, Wm. O'Brien.

Young herd—1, A. Bradshaw; 2, Wm. O'Brien.

SHEEP

COTSWOLDS.

Ram, 2 shears and over—1, A. C. Servant, Overton; 2, A. G. Dickson, Chatham.

Ram, shearling—1, Chas. Symes.

Ram, lamb—1, A. C. Servant; 2 and 3, A. G. Dickson.

Ewe, 2 shears and over—1 and 2, A. C. Servant; 3, A. G. Dickson.

Ewe, shearling—1 and 2, A. C. Servant.

Ewe, lamb—1 and 2, A. C. Servant; 3, A. G. Dickson.

Pen, Ram and 4 Ewes—1, A. C. Servant; 2, A. G. Dickson.

Pen, Ram Lamb and 3 Ewes—1, A. Servant.

(Continued on page 24)

The Cape Breton Island Exhibition.

(Continued from page 7.)

POULTRY.

J. P. Landry, Truro, placed the prize tickets in the poultry classes, the showing in which was very creditable. In the American and Mediterranean breeds there were big entries of quality stock.

President Young, S. P. Calhoun and R. M. Jackson, the Secretaries of the fair, were untiring in their efforts in making matters run as smoothly as possible and their efforts were crowned with success. They had a capable corps of Superintendents and good order prevailed.

Young Cape Bretonians who are employed away from home or who are contemplating going away from home to earn their living in other countries would find enough at the Sydney exhibition to stimulate in them a healthy respect for the farming possibilities of the Island of Cape Breton and we have no doubt that many prodigals will ere long return and that the products of their farms will help to make the Sydney exhibition bigger and better in future years.

Prize Winners at the Cape Breton Island Exhibition.

HORSES

DRAFT HORSES.

Stallion, any pure breed, 3 years old and over—1, H. A. Moffatt, North Sydney.

Stallion, any pure breed, 2 years old—1, L. G. Matheson, Hunter's Mt.

Mare or Gelding, any breed or grade 4 years and over—1, J. S. McLellan, Sydney; 2, D. R. Nicholson, Coxheath; 3, D. R. Nicholson.

Mare or Gelding, any breed or grade 3 years old—1, E. J. Johnston, George's River.

Mare or Gelding any breed or grade 1 year old—1 and 2, D. R. Nicholson; 3, A. C. Thompson, North Sydney.

Mare or Gelding, any breed or grade under 1 year—1, Fred J. McLeod, Sydney Mines; 2, E. J. Johnston; 3, A. C. Thompson.

Brood Mare, with foal by her side—1, A. C. Thompson; 2, Fred J. McLeod; 3, E. J. Johnston.

Matched pair shown in harness, open to farmers only—1, Cross Fertilizer Co. Farm.

Best Stallion, any breed or Grade—Diploma—H. A. Moffatt.

Stallion and 3 of his get—Diploma—H. A. Moffatt.

COUNTY SWEEPSTAKES

Victoria County—1, L. G. Matheson

Cape Breton County—1, H. A. Moffatt.

GENERAL PURPOSE HORSES

Any Breed or Grade.

Mare or Gelding, 4 years and over 1, John Morley, Sydney; 2, M. J. Johnston, Sydney; 3, John McMullin.

Mare or Gelding, 3 years old—1, J. Fraser, McKenzie Reserve; 2, G. J. Ross, Sydney.

Mare or Gelding, 2 years old—1, Murdo McDonald, Hillside; 2, A. J. McLeod, South Bar; 3, F. C. Andrews Coxheath.

Mare or Gelding, 1 year old—1, Murdo McKenzie; 2, R. M. Jackson; 3, M. McKenzie.

Mare or Gelding, under 1 year—1, J. Webster Allen; 2, Archie Matheson, Caribou; 3, G. D. Alward.

Brood Mare, with foal by side—1, G. D. Oland; 2, Wm. Crowdis, Millville; 3, C. A. Munn.

Matched pair, shown in harness, open to farmers only—McCallum Special—1, Fertilizer Exp. Farm.

COUNTY SWEEPSTAKES.

Best Mare or Gelding, any Breed, Grade, any age

Inverness Co.—1, John H. Ross.

Richmond Co.—1, M. E. McNeil, Irish Cove.

Cape Breton Co.—1, John Morley.

CARRIAGE HORSES.

Stallion, pure bred, 3 years old and over.—1, Frank Redding, North Sydney; 2, G. V. Purvis, North Sydney; 3, Alex. Jamieson, Sydney.

Mare or Gelding any breed or grade 4 years old and over—1, Rev. R. W. McIsaac, East Bay; 2, John H. Ross; 3, John McQueen.

Mare or Gelding, 3 years old—1, Alex. Campbell; 2, A. P. Shaw.

Mare or Gelding, 2 years old—1, Ira Hughes; 2, Chas. Thompson.

Mare or Gelding, 1 year old—1, Robert Johnston, N. Sydney; 2, Thos Hart, Lesters Creek.

Matched Pair, shown in Harness—1, Thos. Hart.

COUNTY SWEEPSTAKES.

Cape Breton Co.—1, Frank Redding

ROADSTER HORSES.

Stallion, pure bred, 3 year old, or over—1, G. G. Purvis; 2, McKenzie Bros.; 3, A. D. McCuish, Lochside.

Stallion, pure bred, 2 years old—1, Dr. McGarry, Florence.

Mare or Gelding ant breed or grade 4 years old and over—1, Charles Thompson; 2, M. D. McPhee; 3, W. Drysdale, Sydney.

Mare or Gelding 3 years old—1, Thos. Wilson; 2, L. P. Christie; 3, A. N. Morrison, Sydney.

Mare or Gelding, 2 years old—1, Charles Thompson; 2, Wm. Condon; 3 A. W. McKenzie, Sydney.

Mare or Gelding, 1 year old—1, Rev R. W. McKenzie; 2, Percy Hill, P. E. Edward; 3, E. W. Adams.

Mare or Gelding, under 1 year—1, Frank Lewis; 2, A. L. McDonald, Sydney Forks.

Brood Mare with foal by side—1, A. L. McDonald.

Marched Pair, shown in Harness—1, Thos. Hart.

Brood Mare and 2 of her progeny—Diploma—Thos Wilson.

COUNTY SWEEPSTAKES

Richmond Co—1, A. D. McCush.

Cape Bretan Co.—1, G. G. Purvis.

PONIES, 12½ hands and under.

McKenzie & Griffin's "The Toggery" Sydney, prize for best mare or gelding, any breed or grade, 4 years old or over—Gentleman's Suit, made to measure—Chas. Thompson.

CATTLE

WORKING OXEN.

Best Yoke Working Oxen, any age—1, G. V. Vail, Sydney.

DAIRY CATTLE

HOLSTEINS

Bull, 3 years or over—1, D. R. Nicholson; 2, North Sydney Agricultural Society.

Bull, 2 years old—1, R. T. McDonald, Leitches Creek; 2, John A. McDonald, Middle River.

Bull, 1 year old—1, Cross Fertilizer Co. Farm; 2, D. R. Nicholson; 3, W. Drysdale, Sydney.

Bull, senior calf—1, W. C. MacLeod & Sons, Loch Lomond West.

Bull, junior calf—1 O. R. Nicholson

Cow, in milk, 4 years old or over—1 and 3, D. R. Nicholson; 2, Cross Fertilizer Farm.

Dry Cow, 4 years old or over—1, D. R. Nicholson; 2, A. K. Jackson & Son, North Sydney.

Cow, in milk, 3 years old—1, D. R. Nicholson.

Dry Cow, 3 years old—1, D. R. Nicholson.

Heifer, 2 years old—1 and 2, Cross Fertilizer Farm.

Heifer, 1 year old—1, D. R. Nicholson.

Heifer, senior calf—1, Cross Fertilizer Farm; 2, D. R. Nicholson; 3, A. K. Jackson & Son.

Heifer, junior calf—1, Cross Fertilizer Farm; 2, C. A. Munn, N. Sydney.

Best Bull, any age—Diploma— D. R. Nicholson.

Bull, and 3 of his get—Diploma— D. R. Nicholson.

Cow, and 2 of her progeny—Diploma—D. R. Nicholson.

Herd—1, D. R. Nicholson; 2, Cross Fertilizer Farm.

COUETY SWEEPSTAKES.

Victoria Co.—John A. MacDonald.

Richmond Co.—W. C. MacLeod & Sons.

Cape Breton Co.—D. R. Nicholson.

AYRSHIRES.

Bull, 3 years old or over—1, John H. Ross, Margaree.

Bull, 2 years old—1, South Bar Agricultural Society; 2, Wm. Chisholm, Loch Lomond; 3, Xmas. Island Agricultural Society.

Bull, 1 year—1, Alex. Boutilier, Blacketts Lake; 2, George's River Agricultural Society; 3, East Bay Agricultural Society.

Bull, senior calf—1, M. W. Ross & Son, Centreville.

Bull, junior calf—1, Cross Fertilizer Co. Farm.

Cow, in milk, 4 years old or over—1, M. W. Ross & Son; 2 and 3, H. C. Rose, Baddeck.

Dry Cow, 4 years old—1, H. C. Rose 2 and 3, M. W. Ross & Son.

Heifer, 2 years old—1, Chas. Barret, Mira Road; 2, Cross Fertilizer Co. Farm; 3, M. W. Ross & Son.

Heifer, 1 year old—1, Chas. Barret; 2, M. W. Ross & Son.

Heifer, junior calf—1, H. C. Musgrave, North Sydney; 2, M. W. Ross & Son.

Best Bull, any age—Diploma—South Bar Agricultural Society.

Herd—1, H. C. Rose.

COUNTY SWEEPSTAKES

Best Pure Bred Bull, any age.

Inverness Co.—John H. Ross.

Victoria Co.—H. C. Rose.

Richmond Co.—Wm. Chisholm.

Cape Breton Co.—South Bar Agri-Society.

JERSEYS.

Bull, 3 years or over—1, H. A. Moffatt, Jacksonville.

Bull, over 1 year old—1, J. Webster Allen, Eorth Sydney; 2, Donald Johnston, Leitches Creek.

Bull, junior calf—1, Donald Johnston.

Cow in milk 4 years old—1, J. Webster Allen; 2, D. R. Nicholson; 3, A. K. Jackson & Son.

Dry Cow, 4 years old—1, A. K. Jackson & Son.

Cow, 3 years old—1 and 2, H. A. Moffatt; 3, Donald Johnston.

Dry Cow, 3 years old—1, Donald Johnston.

Heifer, 2 years old—1, Donald Johnston.

Heifer, 1 year old—1 and 2, H. A. Moffatt; 3, D. R. Nicholson.

Heifer, senior calf—1 Donald Johnston; 2, M. W. Ross & Son.

Heifer, junior calf—1 and 2, J. Webster Allen.

Best Bull, any age—Diploma— H. A. Moffatt.

Cow and 2 of her progeny—Diploma—J. Webster Allen.

Herd—1, H. A. Moffatt; 2, J. Webster Allen; 3, Donald Johnston.

COUNTY SWEEPSTAKES

Cape Breton Co.—H. A. Moffatt.

GUERNSEYS.

Bull, 3 years old aud over—1, Little Bras D'Or Agri. Society; 2, G. O. Purvis.

Bull, 2 years old—1, Murdo McKenzie; 2, A. W. McDonald, South Cove.

Bull, 1 year old—1, R. M. Jackson, Jacksonville.

Bull, junior Calf—1, Chas. Johnston, Little Bras D'Or.

Cow, 4 years old—1, Murdo McKenzie; 2, R. M. Jackson.

Cow, 3 years old—1, E. J. Johnston, George's River.

Dry Cow, 3 years old—1, Murdo McKenzie.

Heifer, 2 years old—1, R. M. Jackson.

Heifer, 1 year old—1, E. J. Johnston.

Heifer, senior calf—1, Murdo McKenzie.

Best Bull, any age—Diploma—Murdo McKenzie.

Herd—1, Murdo McKenzie.

CLUNTY SWEEPSTAKES

Best Bull, pure bred, any age

Victoria Co.—A. W. McDonald.

Cape Breton Co.— Murdo McKenzie

GRADE JERSEYS and GUERNSEYS

Cow, 4 years and upwards—1, D. R. Nicholson; 2, John McQueen; 3, W. Drysdale; 4, H. A. Moffatt; 5, W. Drysdale; 6, T. C. Munn; 7, J. W. Allen; 8, G. Hilton; 9, John McQueen.

Dry Cow, 4 years old—1, D. R. Nicholson; 2, E. J. Johnston; 3, Ira Hughes; 4, C. A. Munn; 5 and 6, Mrs. J. Calver.

Cow, 3 years old—W, Ira Hughes; 2 and 3, Albert Ferguson; 4, Murdo McKenzie; 5, M. P. Gillis.

Dry Cow, 3 years old—1, R. M. Jackson; 2, Murdo McKenzie.

Cow, 2 years old—1, W. Maigoraw; 2, H. A. Moffatt; 3, M. P. Gillis; 4, T. C. Munn; 5, John P. Harvey.

Heifer, 2 years old—1, G. D. Oland.

Heifer, senior yearling—1, Murdo McKenzie; 2, M. J. Ingraham; 3, A. N. Morrison; 4, G. D. Oland; 5, C. C. Collier.

Heifer, junior yearling—1 and 2, Murdo McKenzie; 3 and 5, E. J. Johnston; 4, A. N. Morrison.

Heifer, senior calf—1, Ira Hughes; 2 and 4, Murdo McKenzie; 3, C. A. Munn; 5, J. P. Harvey.

Heifer, junior calf—1, Fertilizer Co.; 2, D. McKay; 3 and 5, Murdo McKenzie; 4, A. L. McDonald.

GRADE AYRSHIRES AND HOLSTEINS.

Cow, 4 years old—1, C. A. Munn; 2 and 6, T. C. Munn; 3, J. McQueen; 4 and 5, H. A, Moffatt; 7, A. Jamieson 8, D. R. Nicholson.

Dry Cow, 4 years old—1, C. A. Munn; 2, R. M. Jackson; 3, T. C. Munn; 4, D. R. Nicholson; 5, H. A. Moffat; 6 and 8, G. D. Oland; 7, M. Morehead.

Cow, 3 years old—1, Ira Hughes; 2, T. C. Munn; 3, H. C, Musgrave; 4, M. P. Gillis; 5, D. R. Nicholson.

Dry Cow, 3 years old—1, Mrs. Jas. Marvell.

Cow, 2 years old—1, John A. McNeil; 2 and 4, D. R. Nicholson; 3, A. K. Jackson & Son; 5, M. W. Ross & Son.

Heifer, 2 years old—1 and 2, D. R. Nicholson; 3, Fertilizer Co. Farm; 4, C. A. Munn.

Heifer, senior yearling—1, E. Doncaster; 2, Murdo McKenzie; 3, T. C. Munn; 4, Angus J. McLeod; 5, R. M. Jackson.

Heifer, junior yearling—1, Murdo McKenzie; 2, D. R. Nicholson; 3 and 5, Geo. D. Oland; 4, T. C. Munn.

Heifer, senior calf—1, R. M. Jackson; 2, C. A. Munn; 3, J. McQueen; 4, G. D. Oland.

Heifer, junior calf—1, C. A. Munn; 2, J. McQueen; 3, T. C. Munn; 4, R. M. Jackson; 5, Fertilizer Co.

SYDNEY PRIZE LIST GALLEY 2

Cow, and 2 of her progeny—Diploma—T. C. Munn.

HERDS.

Pure Bred Bull and 3 heifers under 3 years—1, Fertilizer Co. Farm; 2, D. R. Nicholson; 3, M. W. Ross & Son.

Best Herd of five Grade Cows, three of which must be over 2 years—1, C. A. Munn; 2, Fertilizer Co. Farm; 3, D R. Nicholson.

Best Herd four Grade heifers under 3 years, bred and owned by exhibitor—1, D. R. Nicholson; 2, G. D. Oland; 3, T. C. Munn.

COUNTY CONTEST GRADE HERDS

Best Herd of 5 cows, three of which must be over 2 years old—
Cape Breton Co—C. A. Munn.
Best Herd of four heifers, under 3 years, bred and owned by exhibitor
Cape Breton Co—D. R. Nicholson.
Best Bull, any age or breed—D. R. Nicholson.
Best Cow, any age or breed—J. W. Allen.
Grade Cow, any age—C. A. Munn.

SHEEP

LEICESTERS—Pure Bred.

Ram, 2 years old—1, Nelsie Beaton, Coxheath; 2, E. Hill, Pt. Edward; 3, John McKiegan, Mineral Rock.

CHEVIOTS.

Ram, 2 years old—1, Wilson Gillis, George's River; 2, Donald McFarlane, Coxheath.
Ewe, 1 year old—1, Wilson Gillis.

SOUTHDOWNS.

Ram, 2 years old—1, W. M. Hill, Pt Edward.
Ram Lamb—1, Mrs. A. Clarke, Coxheath.
Ewe, 2 years old—1, Mrs. A. Clarke 2, W. M. Hill.
Ewe Lamb—1, John McMullin.
Pen—1, John McMullin.

SHROPSHIRES.

Ram, 2 years old—1, John P. Harvey, George's River; 2, A. B. McPhee, George's River; 3, Neil McDonald, Big Beach.
Ram, 1 year old—1, Neil McDonald.
Ram Lamb—1, John P. Harvey; 2, Neil McDonald; 3, Angus McIntyre, Rear of Ball's Creek.
Ewe, 2 years old—1, John P. Harvey; 2 and 3, Neil McDonald.
Ewe Lamb—1 and 3, Neil McDonald 2, Angus McIntyre.
Pen—1, Neil McDonald.

OXFORDS.

Ram, 2 years old—2, E. J. Johnson; 2, M, P. Gillis; 3, D. J. McKenzie.
Ewe, 2 years old—1, 2 and 3, E. J. Johnston.
Ewe, 1 year old—1, E. J. Johnson.
Ewe Lamb—1, 2 and 3, E. J. Johnson.
Pen—1, E. J. Johnson.

ANY OTHER PURE BREED.

All prizes in this section were won by H. C. Rose.

COUNTY SWEEPSTAKES.

Cape Breton Co.—E. J. Johnson.
GRADES AND CROSSES—Long Wool
Ewe, 2 years old—1, Nelsie Beaton.
Ewe, 1 year old—1, Albert Ferguson; 2, N. Beaton; 3, John McKeigan.
Ewe Lamb—1, Wilson Gillis; 2, John McKeigan; 3, N. Beaton.
Pen—1, N. Beaton.

GRADES AND CROSSES—Medium Wool.

Ewe, 2 years old—1, A. B. McPhee; 2, E. J. Johnson; 3, John P. Harvey.
Ewe, 1 year old—1, John P. Harvey; 2, A. B. McPhee; 3, D. J. McDougall, Xmas. Island.
Ewe Lamb—1 and 3, E. J. Johnston; 2, D. R. McIsaac & Son.
Pens—1, E. J. Johnson; 2, John P. Harvey.

COMMON SHEEP.

Ewe, 2 years old—1, A. B. McPhee 2, Cohn McMullin; 3, M. P. Gillis; 4, W. M. Hill; 5, N. Beaton.
Ewe, 1 year old—1, E. M. Clarke; 2 McPhee; 3, N. Beaton; 4, Mrs. Mary McKinnon; 5, Norman McDonald.
Ewe Lamb—1, M. P. Gillis; 2, Norman McDonald.

FAT SHEEP.

Fat Ewe—1, Albert Ferguson; 2, John McMullin; 3, Murdo McKenzie.
Fat Ewe Lamb—1, Albert Ferguson; 2, Nelson Beaton; 3, Murdo McKenzie
Fat Wether Lamb—1 and 2, E. J. Johnston.

SWINE

BERKSHIRES.

Boar, 1 year old—1, J. S. McLellab, Sydney
Boar, under 1 year—1, A. D. McCuish; 2, D. R. Nicholson; 3, R. M. Jackson.
Sow, 1 year old—1, J. S. McLellan; 2, R. M. Jackson.
Sow, over 6 mos.—1 and 2, D. R. Nicholson; 3, A. D. McCuish.
Sow, under 6 mos.—1, R. M. Jackson.
Sow, with litter—1, J. S. McLellan

YORKSHIRE.

Boar, under 1 year—1, Fertilizer Exp. Farm; 2, D. R. Nicholson.
Sow, over 1 year—1, D. R. Nicholson; 2, John McQueen; 3, M. P. Gillis.
Sow, over 6 mos.—1, M. P. Gillis; 2 and 3, D. R. Nicholson.
Sow, under 6 mos.—1 and 2, John McQueen; 3, D. R. Nicholson.
Sow and litter—1, D. R. Nicholson.
Herd—1, D. R. Nicholson.

CHESTER WHITES.

Boar, 1 year old—1, Ira Hughes.
Boar, under 1 year—1, D. R. Nicholson; 2, Ira Hughes.
Sow, over 1 year—1 and 2, Ira Hughes; 3, D. R. Nicholson.
Sow, over 6 mos.—1 and 2, D. R. Nicholson; 3, Ira Hughes.
Sow, under 6 mos.—1, E. J. Johnson; 2, Murdo McKenzie; 3, D. R. Nicholson.
Sow, with litter—1 and 3, Ira Hughes.
Herd—1 and 3, Ira Hughes.

COUNTY SWEEPSTAKES

Cape Breton Co.—Ira Hughes.

GRADES AND CROSSGS.

Sow, 1 year old—1 and 2, D. R. Nicholson.
Sow, 6 mos. old—1, H. C. Musgrave; 2, N. Beaton.
Sow, under 6 mos.—1, Ira Hughes; 2, H. C. Musgrave.
Sow and litter—1, R. M. Jackson.
Fat Hog, 1 year old—1 and 2, D. R. Nicholson; 3, A. N. Morrison.
Fat Hog, under 1 year—1, Ira Hughes.

POULTRY

Brahmas— Laurie Wilson, 1 and 2 Cockerel and 1 and 2 pullet.
Barred Rocks—M. W. Ross & Son 1c, 2r; T. C. Munn, 2c, 1h, 3 and 4p; Cross Fertilizer Co. Farm, 3c, 3h, 1 and 5h, 1p; Hans Holm, 2h; Jas. A. McNeil; 3r; F. E. Jackson, 2p.
White Rocks—H. Boutilier, 1c, 1h, 3r, 5p; A. H. Whitman, 2c, 1 and 2r, 1 and 2p; E. Concaster, 3c, 2h; Cross Fertilizer Farm, 3p.
Buff Rocks—All prizes to W. R. Twiner.
Golden Wyandottes—All prizes to T. C. Munn.
Silver Wyandottes—All prizes to F. H. Rudderham.
Columbia Wyandottes—All prizes to T. C. Munn.
White Wyandottes—G. R. Musgrave, 1c; A. K. Jackson & Son, 2c, 1h, 2r, 5p; A. J. McLeod, 3c; M. W. Ross & Son, 2 and 3h; 4r; F. E. Jackson, 1 and 3r, 1, 2 and 3p.
Partridge Wyandotte—T. C. Munn, 1c, 1h, 2r, 1 and 2p; F. E. Jackson, 1r, 3p; G. E. Musgrave, 3r.
S. C. Rhode Island Reds— T. C. Munn, 1c, 2 and 3r, 1p; H. W. Lovett 2c, 3h, 2p; C. W. Lovett, 3c, 2h, 1r, 3p; Chas. Thompson, 1h.
R. C. Rhode Island Reds— G. R. Musgrave, 1c, 1 and 2r; Chas. Johnston, 2 and 3c, 1, 2 and 3h; 3r, 1, 2 and 3 p.; H. W. Lovett, 1h.
S. C. White Leghorns—Chas. Johnston, 1, 2 and 3c, 4 and 5h; A. J. McLeod, 4c, 3h, 1and 3r, 1, 2, 3 and 4p; Clifford Lewis, 5c, 4h; Cross Fertilizer Co. Farm, 1 and 2h; M. McDonald, 2r, 5p.
R. C. White Leghorns—All prizes to 604.
S. C. Brown Leghorns—A. K. Jackson & Son, 1c, 3h, 1r, 1, 4 and 5p; H. J. Hunt, 2c, 2 and 3r, 3p; H. W. Lovett, 3c, 2h, 5r, 2p; G. R. Musgrave, 4c,
R. C. Brown Leghorns—Chas. Johnson, 1 and 2c, 1 and 2h; 2 and 3r, 1, 2 and 3p; J. D. Fraser, 1r.
S. C. Buff Leghorns—F. E. Jackson, 1c, 1h, 2r, 1p; Chas. Johnson, 1r, 2p.
S. C. Black Minorcas—G. Wilson, 1c 1h, 3p; M. W. Ross & Son, 2c, 2 and 3h, 3r; Cross Fertilizer Co. Farm, 1r; Hans Holm, 2r, 1p; Rev. D. McLeod, 3p.
S. C. White Minorcas—All prizes to M. W. Ross & Son.
White Orpingtons—All prizes to A. Matheson.
Buff Orpingtons—All prizes to H. Boutilier.
Hamburgs—All prizes to M. W. Ross & Son.
Houdans—All prizes to H. J. Hunt.
Polands—All prizes to F. E. Jackson.
Anconas—M. W. Ross, 1c, 3r, 3p.; H. W. Lovitt, 2 and 3c, 1 and 2h, 1 and 2r, 1 and 2p.
Game—Jno. McLean, 1c, 1h; H. Marr, 2c, 2h; L. Fielbirg, 1r, 1p.; R. L. Gillis, 2r, 2p; C. Morrison, 3r, 3p.
Any Other Variety—D. K. McConald—1c, 2h, 3r, 3p; Thos Hart, 1h; F. H. Rudderham, 1r, 1p.; J. D. Fraser, 3r, 3p.
Game Bantams—Cross Fertilizer Co. Farm, 1 and 3c, 1 and 3h; M. W. Ross & Son, 2c, 2h, 1 and 2r, 1 and 2p.
Sea Bright Bantams—All prizes to F. E. Jackson.
Buff Cochin Bantams—H. W. Lovitt 1c, 1h, 1r, 1p; C. W. Lovitt, 2c, 2h.
Buff Cochin Bantams—H. W. Lovett 1c, 1h; C. W. Lovitt, 2c, 2h, 1r, 1 and 2p.

BREEDING PENS.

Plymouth Rocks—1 and 3, B. Hughes; 2, D. R. McIsaac & Son.
Wyandotte—1, M. W. Ross & Son; 2, A. J. McLeod; 3, A. K. Jackson & Son.
Rhode Island Reds—1, C. W. Lovitt; 2, H. W. Lovitt.
Any Other Variety—1, H. R. Richardson; 2, A. J. McLeod; 3, A. K. Jackson.

TURKEYS.

Bronze—All prizes to Wm. Crowdis.

GEESE.

Male, sr.—1, H. Brody; 2, Hans Holm; 3, Mrs. H. A. Moffatt.
Male, jr—1, Hans Holm.
Female Sr.—1, H. Brody; 2, Hans Holm; 3, Mrs. H. A. Moffatt.
Female, jr—1, Hans Holm.

DUCKS.

PEKIN.

Male sr.—1, Hans Holm; 2, H. W. Lovitt; 3, F. J. McLeod.
Male, jr—1, Hans Holm; 2, Wm. Condon; 3, H. W. Lovitt.
Female sr—1, Hans Holm; 2, Miss Dora Haggerty; 3, John McMullin.
Female jr—1, Hans Holm; 2, H. W. Lovett; 3, J. W. Allen.
Rouens—All prizes to A. W. Wambolt.
Pair Guinea Fowls—1, Wm. Crowdis

DRESSED POULTRY

Pair Fat Fowls—1, E. J. Johnson; 2, Mrs. H. A. Moffatt.
Pair Fat Chickens—1, Jas. A. McNeil; 2, T. C. Munn; 3, Mrs. Ira Hughes.

LUNENBURG COUNTY EXHIBITION

Prof. M. Cumming, Secretary for Agriculture, in Nova Scotia, formally opened the Lunenburg County exhibition, Thursday afternoon, at Bridgewater. The exhibition has been one of the best ever held in the county, the display of live stock was very good, the outstanding feature being the great showing of oxen.

On Wednesday afternoon, Mayor Kinlay, of Lunenburg town gave a short address. He said he thought the arrangement of the exhibition better than that at Halifax, since the people had a better chance to get some real educational values from the exhibits. Mayor Dawson, of Bridgewater, then gave a short summary of the growth of agriculture in the Province, and of agricultural societies in Lunenburg county. Prof. Cumming then declared the exhibition formally open. Mr. Cumming congratalated the management on their success in getting up such an excellent fair. He then drew attention to the movement which has been started in Bridgewater towards the establishment of a co-operative dairy, giving the advantages which would come from such a movement, to the people of the county.

LIVE STOCK.

The display of live stock is good, oxen being the outstanding feature, it is doubtful if a better display of oxen could be given in any part of the Dominion. There was over twenty entries. There was a good showing of dairy cattle, but the county has quite a little room for improvement in their dairy cattle.

Sheep and swine were well up to the average.

Poultry was fair, with quite a large number of exhibits. The poultry building has been considerably improved since last year by the addition of proper pens.

Standard bred horses are gaining a good foothold in the county, if one can judge by the number and quality of those exhibited. Marshall M. owned by G. A. Mader, Mahone Bay, was on exhibition and he certainly is a good example of the breed. His gets seem to be larger than he so that the fault of his smallness does not seem to do him any damage. As the work in the county is done largely with oxen, the show in heavy horses was very small, but without doubt with the advance of agriculture, draft horses will be more extensively bred.

The horse races on Wednesday afternoon interested a large number of people. General Wood, owned by Henry Mitchell, of Chester, won first place.

On Thursday, the second day there was a record attendance, the weather was perfect, and the Lunenburg county people are deeply interested in the success of their fair. The parade of cattle and oxen and the parade of carriage horses with lady drivers were some of the features in the afternoon. Music was supplied by the 75th regiment band, and Hebb's orchestra.

The exhibition buildings are probably the best of any in the Province, where county exhibitions are held, and a new, educational building is now being constructed for the purpose of agricultural education. Next year the agricultural college at Truro will pue on a course somewhat similar to the short course given at Truro in January. Certainly the Lunenburg county exhibition has been a success.

DAIRYING.

Feed Giving for Great and Economical Results.

All are aware that a good dairy cow provides the most dependable and most profitable market for the grains and grasses grown upon the farm. Of all farm animals she is the most economical and profitable producer of human food. The evidence of this fact is specifically cited through an experiment carried on many years ago by Law & Gilbert. It was this experiment which demonstrated that the cow yielding 10 quarts of 4 per cent milk daily was producing as much fat and fat equivalent in seven days as the steer that was gaining 15 pounds in the same time. In addition to this the cow's production contained six times as much nitrogenous material, with concentrates or expensive food and a small amount of roughage.

The market for dairy products does not fluctuate in the uncertain manner that markets for other farm products do and therefore provides a more certain source of profit without a risk of loss. The feed given the cow today is returned to her owner tomorrow, and can be marketed at once.

The certainty of dairying has been made impressive by the fact that once a month, once a week or every day, if he so chooses, the dairyman may have a check for the work his cows did the month, or week, or day before, insuring permanent and steady prosperity.

The demand for productive cows has provided a most profitable business for breeders of dairy cattle. The farmer in all parts of America is rapidly becoming convinced that there is a vast difference between the profits yielded by a common cow and a cow whose ancestors have been bred for economical and profitable production for hundreds of years.

Although since 1875 the number of milk cows have doubled, prices for dairy products have steadily advanced and the price of good cows has increased by leaps anh bounds. During this period the population of this country has more than doubled showing that rapid as has been the increase of the number of cows they have not kept abreast of the growing demand. Judging statistics from reliable sources the population is to again double during the next 35 years and in order to maintain the present price of dairy products the cow population must also double or their average production be greatly increased. The breeders, who furnish the blood for the improvement that is necessary as well as for increasing the number of cows from 22,000,000 to 44,000,000, are assured of great prosperity in their business during a lifetime.

Those who have traveled through districts where grain farming almost solely prevails have no doubt been favorably impressed with the place the cow fills in American agriculture as a home builder. Nothing adds to the dignity of farm life like a good home; and American agriculture, no matter how profitable, will never reach the plane of dignity on which it belongs until the farm home is made attractive enough so that the one farm is owned in one family for generation after generation. This is never the case in grain farming districts where the farmer takes from the soil and markets the fertility with the consideration of immediate gain only. He works his farm during the crop growing season, markets his grain and has little of interest in the farm until another season and nothing to either render it possible or desirous for him to provide a home on the farm. His one purpose is to accumulate immediate wealth at the expense of future generations that he may retire and move to town.

The dairy farmer, on the other hand, is kept on the farm and in remunerative business the whole year. The interest and pride that the progressive farmer of today takes in building up his herds and his farm leads him to make there a home for himself and his children and his children's children that follow him.

These facts need not be dwelt upon for, unlike farmers in other countries, Americans have learned through experience the results accruing from association with the cow that daily consumes what is raised on the farm and twice daily returns to her owner a product of increased value.

In too many instances, however, the producer of milk and butter-fat has overlooked the importance of reducing his operations to a strictly business basis. This is demonstrated by the fact that so often he refuses to apply business principles and even holds them up to scorn as being theoretical, scientific and impractical. He has refused fundamentals which have made millionaires and leaders of men in other lines of industry. The truth of this is evidenced by the fact that of the millions of cows now being milked in the United States only one out of three on the average returns real profit.

As a matter of fact the farms of the United States are her greatest factories. Every cow is kept there as a machine of certain capacity and efficiency for the purpose of converting the raw materials—the grains and grasses which grow in the fields—into a finished commodity of commerce.—Kimball's Dairy Farmer.

Rich Milk as a Factor in Cheese Making.

In various discussions with cheesemaking farmers in earlier days I was invariably told that in their experience rich milk was not desirable in the manufacture of pressed cheese, and so universally true did this appear to them that in some cases the milk was partially deprived of its cream before it was set for curd. Although this supposition is not entirely eradicated, there is an indisposition to believe that good milk makes better cheese than milk of poorer quality. It was not, however, until the great cheesemaking competition in Chicago in 1893 that I was impressed with the fact that really rich milk was a much more economical material for cheesemaking than average milk, to say nothing of milk which is poor. In that competition the cattle competing were Jerseys, Guernseys and Shorthorns, twenty-five head of each. It is well-known that the quality of cheese made by the rich-milking cattle was considerably greater than that made by the Shorthorns. To take a fortnight's work, for example, it was found that each pound of cheese made from the Jersey milk required only 8.1 lbs. of milk, whereas from the Shorthorn it required 11.3 lbs. This was one of the most important experimental tests which has ever been made, but it can now be supplemented by many others, although one only was conducted upon an equally extensive scale. Of all the recorded cases there is no instance in which rich milk failed to produce so small a quantity of cheese as average milk or in which the cheese made was not of superior quality.

HOW IT AFFECTS THE WEIGHT OF CHEESE.

There are three questions to consider in relation to this subject. With the increase of fat in milk there is an increase in the weight of water retained in the cheese made from it. Thus, the quantity of water may vary from 3 to 6¼ per cent., and, indeed, slightly more. Why this is the case no one has yet discovered so far as I know, but it follows that if milk rich in fat produces cheese which contains more water than cheese made from average or poor milk, the weight of cheese made day by day or month by month is increased from two sources; it is increased because there is an increase in the quantity of water which is conveyed into the cheese, and the greater the quantity of water retained in the cheese.

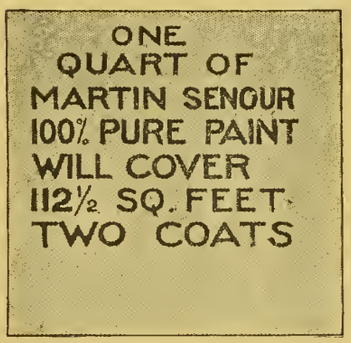
I remember one series of experiments in cheese-making with rich milk in which the solid matter reached 14 per cent., where 12 1-3 lb. pf cheese was produced from over 100 lb. of milk, or very nearly 1¼ lb. per gallon. During a portion of the season the quantity of cheese made nearly reached 1½ lb. per gallon—exceeding, indeed, 14 lb. per 100 lb. of milk, while during another portion of the season it fell as low as 9¾ lb., or slightly less than a pound to the gallon. On one occasion when paying a visit to Mr. Ralston, a famous cheese maker in Scotland, I learned from his experience that the curd when ready for grinding was below the standard in April in each of four year but above it in May in three out of the same four years, that standard being equivalent to one pound of cheese to one gallon of milk. In June the curd was above the standard in two out of the four years only, while in July it reached the same position only in one out of four years. Coming to August, there was very little difference, the curd being just upon the right side in each year, but in September there was a marked increase in the weight of curd and that increase was also marked on the average of the six months in two out of the four years, while in the other two it just about reached the standard.

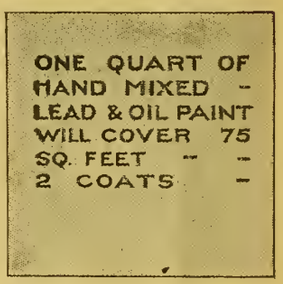
THE INFLUENCE OF SEASON.

There is evidently a good deal to be learned about cheesemaking and the influence of season upon the weight of curd produced. Here we have a good herd of cows all Ayrshires, and all well fed, and a dairy in which the work was well performed, but in one season, which was a dry one, there was a deficit as compared with other seasons of from 6,000 to 8,000 lbs. of

How To Paint for Less Money

The cheapest paint for you to use is the paint that takes the least quantity for the job, even though it costs more per gallon. For just so certain as this paint will cover a greater surface than a lower priced paint, so it will also wear better and give more satisfaction.





Martin-Senour 100% Pure Paint is absolutely the cheapest paint to use because less paint is required to do the job.

In fact, it's an extravagance to use cheaper or hand mixed paint for they not only take more for the job but do not wear as well.

IT PAYS TO USE

"The Paint For Wear and Weather"

There is a dealer in your neighborhood who carries the complete line of Martin-Senour Paints and Varnishes. Write for his name and a "Farmer's Color Set", which will assist you in choosing just the right Paint and Colors for your every requirement. This set is free for the asking. Write for it today. 7

It certainly does pay to use

Windsor Dairy Salt

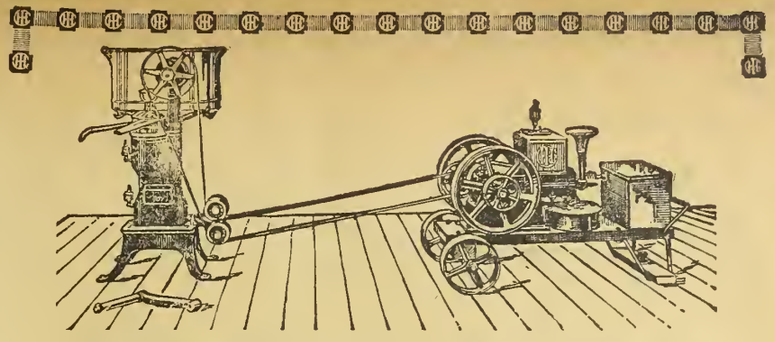
116

curd, while in one of the four years the total weight of curd produced was much superior per 100 lb. of milk to that produced in either of the other three years.

I take the results of another lot of good work in which the milk was divided into five qualities—that containing from 3 to 3½ per cent. of fat, from 3½ to 4 per cent, and so on to the last lot, which contained from 5 to 5¼ per cent. It is remarkable but consistent with what is now known that the fat lost in cheesemaking and found in the whey was reduced as the quality of the milk increased. Thus, in the poorest milk the actual loss of fat was 9.5 per cent., while in the richest it was only 6 per cent. While the poorest milk made 9.1 lb. of cheese per 10 gallons of milk, the richest made 13.6 lb. and there was a gradual increase in the quantity as the quality of the milk increased in value. If the fat percentage of milk is known it is possible to ascertain the approximate weight of the cheese which it will produce per 100 lb. or 10 gallons by multiplying by 2.7, for in all these cases the result gravitated towards this figure.

INFLUENCE ON QUALITY.

Now with regard to the quality of the cheese produced from milk rich in fat, for if quality and quantity are combined as the result of using it it would seem that every effort should be made to increase the quality of the milk of a cheese-making cow, and to once for all abandon the assumption that the Jersey and the Guernsey are mere buttermaking cows and not adapted for cheese making. In making Stilton cheese no cream is added to the milk, as is popularly supposed, but where rich milk is used the cheese made is not only heavier, but more mellow, salvy and agreeable to the palate; that fact I have proved over and over again. The pressed cheese made from poor milk is never mellow enough, and it will not compare wich the best type of cheese which is exhibited at the London Dairy Show. The cheese dealer is not guided solely by his palate and his nose, but by his finger and thumb, and if he finds the consistence of a cheese is salvy he is very nearly satisfied, his palate doing the rest. The presence of a high percentage of fat in cheese accounts for this extra salviness, and adds a decided gout to the tongue of the connoisseur. For this reason I believe there can be nothing more unwise than to remove cream from the milk, while, on the other hand, I am convinced that it will pay the cheesemaker handsomely to increase the quality of the milk supplied by his herd.—James Long.



Next Door to Perfection

POUR your milk into an I H C cream separator. Out of the cream spout will come close to 9,999 parts of cream for only one part that goes into the skim-milk pail. That's marvelously close separation; it means every possible dollar of dairy profit from your cows.

It takes an I H C separator to do such efficient work. Every detail has its use, every mechanical point its purpose. Shafts and spindles are the strongest made for separators. Bearings all have phosphor bronze bushings. Gears work without back lash, and they are protected from dirt and grit. In short, everything in

I H C Cream Separators
Dairymaid, Bluebell, or Lily

makes for great strength and durability. Perfect adjustment and balance mean smoothness and ease in operating, hence continued satisfaction during long life. All parts are easily accessible for cleaning. There are four convenient sizes of each style.

Then if you have a one-horse power back-geared I H C engine to complete your separator outfit, you will soon find that an indispensable helper on the farm. It will run steadily and at the proper speed to pump water, run washing machine, churn, grindstone, etc.

Study I H C separator outfits at the local agent's Catalogues may be obtained from him, or, write to

When you have a bad cold you want the best medicine obtainable so as to cure it with as little delay as possible. Here is a druggist's opinion: "I have sold Chamberlain's Cough Remedy for fifteen years," says Enos Lollar, of Saratoga, Ind., "and consider it the best on the market." For sale by all dealers.

THE ADVERTISING PAGES of the Maritime Farmer will help you to get the most value for you money.

When Dairying Does not Increase Soil Fertility.

Far too few farmers raise enough cows or other live stock on their farms to supply enough manure to keep up the fertility of the large acerages. There should be an increase in the number of head of cattle kept and a decrease in the number of acres necessary to supply food for these cattle. In other words, we should resort to more intensive methods. What farmer is there who has sufficient manure to cover the per cent of his farm that he would like to each year? The man with a 160-acre farm who keeps 40 to 50 cows and 20 to 30 young stock besides hogs and horses is going to see results in the increased productiveness of his fields from the manure derived from these animals.

Some may believe this to be impossible. And it is, if everything that goes to feed the animals comes from the farm. But this should not be the case. If the animals receive no feed other than that grown 'on the farm, the fertility of the soil would be decreasing, for it has been calculated that only four-fifths of any crop fed to animals is returned to the soil in the form of manure. That is, one-fifth goes to make milk, beef or pork. Hence it is easily seen that if nothing is obtained from outside the farm there is an actual lessening of the plant food. The remedy for this state of affairs is to grow all the roughage on the farm necessary to feed the animals and what concentrates are possible, but in the main the concentrates will have to be purchased from outside in the form of cottonseed meal, linseed, gluten or corn meal, the kind to be determined upon by the price and fertilizing value as well as the food value.—O. V. T.

Dairy Thoughts.

The droppings from the cattle will benefit the pasture more if they are spread or broken up with a spike-tooth harrow. This prevents the grass from being killed out and weeds coming in where the droppings have lain.

The most important business of the dairyman is to increase the amount of manurial substances and apply them where they will do the mo(t good to the growing crops.

He is in no wise a public benefactor who keeps two cows to do the work of one.

A poor milker is one of the surest means of diminishing a milk flow.

Too many dairymen are conducting their business as a side issde when they should be making it the leading feature of their farming.

The new cow has an individuality of her own and the feeder should become acquainted with her as soon as possible after she is brought into the herd.

Go your limit on a good bull. If your cows are deficient in the flow of milk, buy a sire that will make up the quality. If their milk is deficient in butter fat, breed from a sire whose tendency is to build up along that line.

Feed records are just as essential as milk records. It is the profits we want rather than the phenomenal milk yields that are made by feeding large quantities of expensive concentrates.

Strong, thrifty calves cannot be expected from cows that have been fed starvation rations for a few months before calving.

Proper feeding determines the amount of gain in the dairy buziness

Milk records and feed records mave knowledge definite.

If we are to make a success of the dairy business we must put thought behind and into our everyday work.

A cow will never do her best unless she has perfect confidence in you.

The modern dairy cow must be hand.ed with understanding and her owner must nave a knowledge of her wants and make every effort to supply them.

A good cow in the hands of a poor dairyman is a poorer proposition than a poor cow in the hands of a good dairyman. Both are very poor combinations: however, a good dairyman will not keep a poor cow more than one season.

Good pasture lands are the basis of successful dairying.

To make dairying a success we must make it of interest to the boys.

Good cows are not developed by chance, but are the product of good judgment, skilful feeding and proper foods.

Sick headache is caused by a disordered stomach. Take Chamberlain's Tablets and correct that and the headaches will disappear. For sale by all dealers.

LIVE STOCK.

Have Heifers Predominate.

By taking up the subject of influencing or controlling the sex of calves, The New Engalnd Homestead has entered a field for investigation that is bristling with opportunities. With uncertainty as to sex of offspring eliminated, the breeding of pedigreed dairy stock should take on the aspects of a genuine get-rich-quick proposition. I know from experience, observation and extended inquiry, that any dairyman with a proper understanding of the biological processes involved, can have his best cows drop heifers, at least much oftener than is now the case.

Observing poultrymen have long bemoaned the fact that cockerels predominate among their early hatched chicks. The accepted explanation of this is that the sex of the more vigorous parent predominates among the offspring. At the beginning of the breeding season, while the male is active and at his best physically, the excess of cockerels will ofter run ewo to one. Toward the end of the season, when his condition has materially changed, pullets frequently predominate by the same ratio. Nearly all large dairymen compalin of an excessive number of bull calves, so it is evident that under ordinary circumstances the sex is already influenced. The difficulty lies in the fact that the influence is in the wrong disection. To appreciate the way out, it is essential to understand something of what takes place beyond the range of immediate observation.

At the moment of service, the seminal fluid from the male is discharged into the upper end of the vagina, some little distance from the place where the actual impregnation occurs. This seminal fluid is filled with a host of minute organisms which the biologists call spermatozoa, or "sperm animals." Only one of these little "animals" is required to fertilize the female cell known as the ovum, and in reaching his coveted goal the winner of the race is obliged to make his journey without assistance. Now while the ovum lies practically dormant, the spermatozoa are exceedingly active. Furthermore, they are not provided with any food supply. Hence, if this final journey is drawn out and impregnation delayed, they become tired. Relatively, the ovum is then the more vigorous member of the uniting pair and the resulting offspring is reasonably sure to be female. The problem for the practical breeder then is to delay actual impregnation after service by the male as long as may be necessary to let the spermatozoa get properly tired.

It is a common knowledge among poultrymen that a hen will lay several fertile eggs after being entirely separated from the male. With this fact in mind I reasoned it out that all the fertile eggs thus laid after the final "treading", except the first, would have a delayed impregnation, and should, therefore, produce pullets. To test this idea I took five leg-banded hens in March and put them into a colony house equipped with trap nests. The cockerel I put into a second colony house alongside the first. Then with the aid of a tally sheet tacked on the wall I saw to it that each hen was mated once for every three eggs. I set 76 eggs from this pen; 75 of them were fertile and 73 actually hatched. I lost about the usual percentage, but when they were old enough to distinguish the sexes, I had 21 cockerels and 39 pullets. Subsequent experiments have given corresponding results, and now I am trying to develop some less laborious method of control.

As for the dairy phase of the problem, it seems possible to delay the actual impregnation only by exercising the cow for a time immediately after service. A neighbor of mine had a small herd of registered Jerseys, the best cow in which had dropped him five bull calves in as many years. She had always been taken away to a very valuable bull, and as the distance was some five miles, it had been the custom to load her into the two-horse wagon, drive up there with her and bring her back. This neighbor was lamenting his excess of bull calves to me one day, and I told him of the experiments I had been conducting. I further expressed the opinion that under the method he had pursued, the impregnation had taken place too soon, on account of the quiet condition of the cow while riding home in the wagon. I suggested that next time he take the cow up, leave her overnight, and then walk her home immediately after service in the morning. He followed my advice, got a heifer calf, has had two others from the same cow since, and what is more, has never had but one bull dropped by a cow in his herd from that day to this.

By extended inquiry I have found that the average dairyman who keeps a bull brings his herd up to the barn at sundown, notes a cow in heat, has her promptly served and then puts her into stall for the night. The conditions are then ideal to induce a quick impregnation and insure a bull calf. On the other hand, the small dairyman who does not keep a bull, is much more likely to let the service go until morning, when he takes the cow away, and generally brings her back. By the exercise which thus follows the service impregnation is delayed and a heifer calf generally results. With very few exceptions, I have found that the sex of a calf could be accurately predicted from a knowledge of the facts above indicated. While, of course, this is not a mechanical proposition, I know that any dairyman who will take the trouble to have his cows served only in the morning, and then exercised moderately for a few hours afterward, will be rewarded by having his calves come heifers by a large majority.—C. M. Gallup, Connecticut.

The Ewe Flock.

If it has not been sooner done it is time to separate the lambs from their mothers. First let us move all the flock to a bit of choice pasture, some bit reserved for this occasion. Let ewes and lambs run there until they become wonted to the place. Then quietly remove the ewes, leaving the lambs where they are. If the lambs are destined for the market it is well to set out troughs and tempt them with oats. No matter how good is the pasturage, a bit of dry grain seems to adhere to the ribs of a lamb. Herein can one distinguish the real shepherd. He remembers his little flock, he goes gladly to feed it, he sees that each lamb comes to eat and all at one time, so that none gets more than its share.

The ewe flock one studies with real interest. He culls some perhaps, but let him beware how he culls out the thinnest ones; possibly they are his best mothers and richest milkers. He carefully trims their feet, he puts the ram with them and marks the date. He puts them on rich pasture because that leads to twin-bearing.

A bite of grain will not hurt the ewe on poor pasture at the breeding season, only beware that it be not too large a bite. Green things are what make the ewe flock happy, and to conceive in multiples.—Breeders' Gazette.

Ringing the Bull.

Despite the oft repeated statement that the gentlest bull can never be trusted, there is no reason why a bull cannot be as well behaved as a stallion provided he has had the proper handling and training while young. It pays to take pains with the future herd-header so that he is easily handled in service or in the show ring.

The bull calf should be taught early to lead at the halter and should be tied up a short time each day, preferably when eating his grain. A light weight ring should be inserted in his nose when he is from nine to 12 months old but under no circumstances should he be led by the ring until three or four months after sothat the nose can heal up well.

Inserting the nose ring is a simple and short operation when properly done. First tie the bull securely to a post by the head and horns, then take a common trocar and cannula, well sterilized, and push it through the thinnest part of the membrane that separates the nostrils, withdraw the trocar, leaving the cannuta in the opening. Put one end of the opened ring in the pointed end of the cannula and then carefully withdraw cannula, which brings the ring into the opening, and after closing ring by putting in the screw, the job is done. Before the operation, the ring should be examined and all rough edges carefully filed down so there is nothing to irritate the nose and keep it raw and bleeding.

When the animal is about two or two and a half years old, the light ring should be removed and a good heavy ring inserted. Iron rings should not be used as they rust and keep the bull's nose raw and sore. The best are made of brass or bronze composition metal and do not rust.

In tying up the bull by the nose, one should be careful to avoid frightening him, causing him to jump back and slit the ring out of his nose. It is safest to pass the tie chain through the nose ring and then up and around his horns and when he jerks back most of the strain comes on the horns and not at the nose.—A. Herdsman.

As announced early in the season, the Dominion Live Stock Branch has this year undertaken a distribution of pure bred male animals throughout Canada on a somewhat extensive scale. In inaugurating this policy the aim has been to aid sections where pure bred sires were lacking and to encourage new communities in following an intelligent system in breeding. This form of assistance has proven very popular and during the past few months a large number of bulls and several stallions have been placed in various parts of the country in the hands of local associations formed specially for the purpose of handling and maintaining them. All animals placed remain the property of the Department of Agriculture, the local associations assuming the responsibility of their maintenance and management under the general supervision of officers of the Live Stock Branch.

The distribution of bulls and stallions having been brought to a close for this year the opportunity is now open to deal with applicants for boars and rams. Full information regarding the rules governing the distribution and the procedure to be followed in forming the necessary organization may be had upon application to the Live Stock Commissioner, Ottawa.

As it is the intention to consider only such requests as are forwarded before October 20th, it will be necessary for districts desiring to eake advantage of this offer to act promptly.

John Bright,
Live Stock Commissioner, Ottawa.

Sheep Shots.

Sheep eradicate weeds.

Send to the Department of Agriculture, Ottawa, for literature on sheep.

Sheep pick up dollars from the stubble fields.

Sheep chores are the lightest chores about the farm.

It costs little to start in sheep, and there is always something to be realized out of them quickly.

Start the sheep flock with whatever stock is available and grade up with the down bucks until you have a first class farm stock.

The Merino-Shrop grade of sheep make a hardy, early maturing type, well adapted to the country, fine in the wool and well covered with flesh.

Organize your neighbors and buy a carload of sheep to put on your stubble.

Sheep will bring you dollars every month of the year.

There are two revenues from a flock of sheep—wool is going up in price, and mutton keeps down the meat bill.

Feeding Steers.

This is the season of the year when those who intend to finish a few steers during the winter should keep their eyes open for good animals to work with. Many cattle are forced to pick their living from scanty pastures that contain very little nutriment after the frosts and sun has has parched and browned the grass. If left to rustle until snow flies they will lose a good deal of the flesh laid on during the summer, and it requires considtrable unprofitable feeding to bring them back to a thrifty condition.

Get them early, and when picking out your feeders look for beef type. Low-set, blocky animals with straight top and bottom lines, good spring of rin and strong heart girth will invariably make the best use of their food. A short, broad head, with prominent lustrous eyes and big muzzle with open nostrils are always evidences of a profitable beef raising conformation. Once you have them never allow cattle to go back. Give them a little help until the time comes to start them toward full feed.

To Prevent Cows Sucking Themselves.

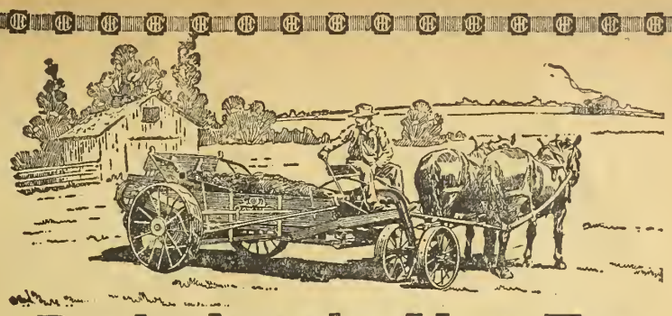
Cows can be prevented from sucking themselves by compelling them to wear a halter through the nose band on which well sharpened ten-penny nails have been securely placed in such a manner that when the attempt is made the nail points come in contact with the udder before the tongue can reach the teats.

Another method is to ring the cow with a large size bull ring.

There is a special muzzle on the market that fits into the nose and acts as a preventive. This can be secured through hardward stores in most communities.

A Good Manger.

The principal requisites of mangers in the cow stables are: 1. They should be large enough to hold the feed so that the cows cannot easily throw it out in front or under their feet. 2. They should be sanitary and easy to clean. 3. They should be arranged so that the cows cannot get their feet in them. 4. They should be divided to prevent cows from stealing feed from each other. 5. They should be convenient for feeding, mixing feed in the manger and removing refuse hay from the front. Most types of mangers, especially when built of wood, are hard to keep sweet and clean, although they may fulfill all other requirements.



Ranked at the Very Top

DAVID Rankin was a big farmer and he knew his business. He owned the largest corn farm in the world, about 35,000 acres down in Missouri. He devoted his life to the pleasant study and practice of right farming, and he succeeded mightily, for he made $4,000,000 in the business of farming. This is what David Rankin said about the manure spreader: "It is the most efficient money-maker on the place."

It's warm praise to be ranked above all other farm machines, but it is in keeping with what all the agricultural world has been recognizing. Soils rebel when crop after crop is taken from them, without return of fertilizer. Witness the abandoned, worn-out farms of New England. Return every bit of manure to the soil by the spreader method. The I H C manure spreader will save you much disagreeable, hard labor, will spread evenly, and will make one ton of manure go as far as two tons spread by hand.

I H C Manure Spreaders

Deering and McCormick

are built to suit you, to do best work for the buyer in every case, to convince him that he has made the wisest purchase. Every detail in the construction has a purpose for which it was made after thorough tests and experiment. They have the maximum of strength and endurance, and their construction bristles with advantages.

You will find all styles and sizes in the I H C spreader line. They will cover the ground with a light or heavy coat, as you choose, but always evenly, up hill or down. There are high and low machines, with steel frames, endless or reverse aprons, but always giving best possible service. Tractive power is assured by position of the rear wheels well under the box, carrying nearly three-fourths of the load, and by wide rimmed wheels with Z-shaped lugs.

These and many other things will interest and convince you if you look the I H C spreader line over at the local agent's. There is one for your exact needs. Read the catalogues that the agent has for you.

9 James Street, Tweed, Ont.

THE HORSE.

Weaning of the Foal.

The weaning of foals takes place towards or during the autumn, but no particular rule is observed in regard to the age, as they may be taken off the dam at any time between four and six months old. Indeed, sometimes they are actually weaned before they reach the former age, more particularly foals born late in the season; but that is not to be recommended. Generally speaking, it is always desirable to postpone the weaning for as long as is feasible, since the more forward and better grown foals are at weaning time the more easily will they get over this critical stage. The exact time will depend upon circumstances, and on the farm these oftentimes necessitate its being done at a comparatively early age, for farmers who breed from working mares are not usually able to study the special interests of foals to the same extent as can be done on stud farms.

When the mare remains lying out in idleness at grass all through the autumn, the most suitable course usually is to allow the foal to run with her until some time in October, or even to the end of that month, although quite possibly—and this applies especially in the case of old mares—her milk may give out earlier. When left with its dam late in the autumn the foal will often practically wean itself, in which case the process is got over without any trouble; and even when the mare no longer suckles it, the two may very suitably continue to run together on the same pasture field, if only for the sake of companionship. In the case of mares required for work, whether they are of the carting or the light-legged class, weaning will necessarily be accomplished earlier. A working mare cannot be expected to continue supporting her foal for as long a period as an idle mare, as that would tax her strength and pull down her condition too much. Moreover, earlier weaning is frequently necessitated owing to the mare having no milk, for constant work has the tendency to dry up the milk flow at a comparatvely early stage. Some regard must be had to the condition of the foal, and early weaning is only advisable in the case of foals that are in a forward and nicely thriving condition.

HAND FEEDING.

It is strongly advised to push foals on well by feeding them on manger food—crushed oats and bran—for some little time before they are to be weaned, so as to have them in as thriving a condition as may be when the separation from the dam takes place. When they have been hand-fed in this way, the weaning is all the more readily accomplished, as they will feel the loss of the milk less, and be thoroughly accustomed to eating a little corn, etc. If it is properly fed and cared for before and immediately after weaning a foal should not lose any flesh. Besides oats and bran, the staple manger foods—oatmeal and ground linseed cake—are most useful as a stand-by at weaning time. The oatmeal may be given both in a dry state and in the form of gruel. Weakly animals might also suitably have some skim milk, or even buttermilk, every day for a month or so, which they will quickly learn to drink greedily, and which are most effective foods for promoting a thriving condition. Other foals and strong ones will not require these special attentions, a fair allowance of crushed oats and bran—together with some good hay, if it late in the autumn or grass keep is short—being all they need, though one cannot easily do foals too well at this stage. The average farmer, at any rate, is not likely even to err on the side of feeding his foals too liberally; and overfeeding, causing foals to go wrong in their joints and to suffer ill-effects through being forced along too rapidly and over-growing themselves, is heard of, as a rule, only in breeding studs where showing of the young stock is gone in for.

It having been determined to wean the foal, the best plan is straightway to separate it from its dam for good. Some breeders are in favor of accomplishing the weaning process by degrees, separating the two only temporarily at first and continuing for some days to allow the foal to have access to the mare and suck her at gradually lengthening intervals the object being to accustom the youngster to do without its mother in a gradual manner, but this mode of weaning unnecessarily frets both mare and foal, and does neither any good. Far from making things easier, it does just the reverse, and these repeated separations and visits are most liable to make the foal cease thriving for the time being, owing to the constant fretting it gives rise to. An experienced old breeder once remarked that this gradual system, though intended to be a kindness to the foal and to facilitate matters for it, put him in mind of the owner of a young puppy, who, wishing to dock its tail, could not bring himself to cut the entire surplus length off all at once, but thought he was acting more kindly by cutting off an inch each day, until it was sufficiently short. An important detail to observe when the foal is taken away from the dam is to accommodate them far away enough from each other that they cannot hear one another's neighing.—Argus.

The Detection of Lameness.

While it is easy enough as a rule to detect lameness in a horse, it is often difficult to locate its exact seat when there are no external symptoms; and as regards the forelegs, the not very experienced are frequently prone to fix upon the wrong leg as being the unsound one. This is quite excuseable for it requires considerable practice to determine offhand which limb it is that the lame horse is saving. The rule to bear in mind is that the animal when moving dwells longest upon the sound leg, while it throws up its head when the lame one comes to the ground and treads quite lightly getting the leg off the ground again as quickly as possible at each stride. Often the lameness only reveals itself when the animal trots, and it becomes especially marked on hard ground. Hence, when a horse is brought out to see whether it is lame one should have it trotted up and down on hard ground. It is also important to have it led on quite a loose rein, so that its head may be free. It is a well-known trick of dealers and others to take a horse short by the head, when showing an animal off, in order to conceal the fact of its being lame in front. Frequently, lameness manifests itself plainly when the horse is standing in the stable by its placing the lame foot slightly in advance of the other, and resting it instead of bearing a proper share of weight upon it. A horse doing this is said to "point" with its foot or leg, and is a suspicious sign if the pointing is persistent, while it is an almost certain indication of actual or incipient lameness. It is usual for all horses very frequently to rest one of their hind-legs and to support themselves only on the other one while in the stable, and that should not be regarded as anything abnormal.

LOCATING THE MISCHIEF.

There is an old saying among horse men to the effect that "though you believe the horse to be lame in the head, always first look at the foot." The meaning of this is that cases where the seat of lameness is not revealed by any definite indication, such as a swelling, abnormal heat, or tenderness, the probability is that the trouble is in the foot, as far as the forelegs are concerned, so that its cause should first of all be looked for here, no matter how strongly inclined one may be to think it is somewhere else. Laymen not having much experience are generally inclined to fix upon the shoulder as the seat of the lameness when its cause cannot be for certain assigned, but shoulder-lameness is rarely met with in ordinary circumstances, and one will as a general rule be pretty safe in ruling out the shoulder straightaway as a probable seat of the mischief. Foot-lameness is of rare occurrence in the hind limbs, and if a horse goes lame behind the most usual seat of the trouble is the hock joint, while

ABSORBINE ***STOPS LAMENESS*** from a Bone Spavin, Ring Bone, Splint, Curb, Side Bone, or similar trouble and gets horse going sound. **Does not blister or remove the hair** and horse can be worked. Page 17 in pamphlet with each bottle tells how. $2.00 a bottle delivered. Horse Book 9 K free.

ABSORBINE, JR., antiseptic liniment for mankind. Reduces Painful Swellings, Enlarged Glands, Goitre, Wens, Bruises, Varicose Veins, Varicosities, heals Old Sores. Allays Pain. DR. J. Woodbury's

Horse Liniment

AFTER USING

Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and notice, its effects, and, honestly judging it on its merits, you will be compelled to endorse it.

It Needs No Painting

Amatite ROOFING

THE superiority of Amatite over all other ready roofing is apparent to anyone who uses it.

Amatite does away with all roofing troubles and unnecessary expenses because it is made with a real mineral surface which *needs no painting*.

It is durable, fire retardant, practical, economical.

Don't buy any other roofing till you look up Amatite. Write to nearest office for samples.

Everjet Elastic Paint

Save money by using this black paint wherever the color is no objection. Elastic, heat-proof, durable. Use it for "rubber" roofings and all exposed iron and wood.

The Carritte-Paterson Mfg. Co., Limited,

St. John, N. B. Halifax, N. S. Sydney, N. S.

sometimes it may be the stifle. In examining the feet for lameness, one should feel whether there is any abnormal heat present, which is the case in fever of the feet (laminitis). The presence of pain in them may be ascertained by tapping lightly on the wall, or sole with a hammer, which will cause flinching, while a pair of hoof-forceps are found very useful for detecting tenderness resulting from corns, etc. Sprains of the backsinews and of the various ligaments of the leg, which kind of injury ranks as one of the most common causes of lameness, especially so in light horses used for fast work, generally manifest themselves very plainly by the fact becoming more or less swollen and the presence of heat; and the pain incidental to sprains is most easily detected by picking up the foot and pressing the sinews between the fingers, when the horse will flinch as soon as the injured part is touched. In some cases, however, it happens that, excepting for the animal going lame, no external symptoms are noticed in the incipient stage of a sprain (though probably some heat could be felt if a sufficiently careful examination were made, and in these circumstances a wrong diagnosis is very easily made by the inexperienced. A useful clue as to the nature of the lameness is often afforded by noting whether it becomes less marked or wears off altogether after the animal has got warmed up to its work or whether it remains the same or gets worse. The former, for instance, is characteristic of the dreaded navicular disease. In the case of this unsoundness the lameness is also often of an intermittent nature in the earlier stages. Grogginess of the legs due to excessive wear, or the stiffness resulting from old age, which is not really a form of lameness, but merely causes a horse to go more or less stiff or short, also tends to wear off after the animal has been out for a little while. Upon the other hand in cases of chronic laminitis one mostly finds the horse will go increasingly unsound when at work, and the same may frequently be observed when a horse is suffering from corns. In the case of sprains or incipient sprains, too, the lameness usually becomes worse with exercise or work.

Sometimes horses suddenly fall lame when being driven or ridden, owing to their hitting a leg with the foot of another, but this is not ordinarily a matter which signifies much, for the lameness will disappear as soon as the pain caused by the blow subsides. It is only when a horse habitually hits itself in this manner, as the result of faulty action, that this trouble is liable to assume a serious aspect. In these circumstances a suitable kind of cloth or leather boot, to protect the part exposed to injury, should be worn. Sudden lameness, when a horse is out may also be caused through a stone lodging in the sole, it having got wedged in between the shoe. Very occasionally an intermittent form of lameness may result from an attack of rheumatism. Stable attendants and insufficiently experienced horsemen are very fond of attributing cases of obscure lameness, the cause of which is not readily detected, to this ailment, but in reality it is quite exceptional for a horse to go lame on that account.

Curb and its Treatment.

This is an enlargement of the ligament on the back part of the hock, or of those structures which hold the bones of the hock in a proper position; upon certain occasions extraordinary stress is put upon them; thus causing a sprain, an enlargement, and lameness. Severe galloping on heavy ground, high or wide jumping with a heavy weight in the saddle, injudicious backing, such as foolish riders or drivers sometimes have recourse to when an animal, from ill-temper or otherwise, objects to go in the desired direction, are among the more common causes of the disease. It is also noteworthy that curb is one of the hereditary complaints the horse is subject to, therefore a mare suffering or having suffered therefrom should not be chosen as a breeder. The best method to detect this defect is to stand close to the hindquarters of the animal, and look down the limb affected, from the cap of the hock, when a slight enlargement will be observed, about 3 in. from the point of the hock. It is also easily detected by taking a glance at the leg sideways. To treat this the object should be to reduce the inflammation, and for this purpose a continual application of cold spring water will be the chief thing. Arnica lotion is also advisable. Equal parts of spirits of wine, water, and vinegar also form a good application in the first stage of the complaint. After such treatment for a week or ten days, the inflammation should have abated, or have entirely left the part, and the next thing to be done will depend upon the state of the disease. Under most circumstances, the best agent probably will be a blister, consisting of biniodide of mercury; but before it is applied the hair should be carefully clipped off the part close to the skin. In bad cases the hot iron even has to be resorted to, but before either blistering or firing it would be prudent to call in a veterinary surgeon as he would be more competent to advise what blister would be best in order to avoid a permanent blemish, or whether a more drastic remedy ought to be employed. The shoeing is the next matter to attend to. The heel of the shoe should be raised so as to take the stress off the back tendons of the limb affected, and this precaution should be taken for a considerable time after the curb has subsided and the animal has resumed work. Rest, however, is absolutely necessary for a considerable time after the swelling has gone down to prevent a recurrence of the inflammation.—Warwick.

Backing Up the Purchaser

IF we didn't have an eye to the future, and if we didn't care what you or anybody else was going to think of us, we could sell engines and other machines for much less money, but we could not put I H C quality into them. The kicks would start coming in right away, and soon there would be no market for I H C engines.

I H C engines stand for everything that is opposed to such a policy. The I H C way is to build always for the respect and good will of the Canadian farmer, and to that end it has been successfully working for many years. The agent who sells you an I H C engine expects on its merits to do business with you again. The purchaser of an

I H C Oil and Gas Engine

buys security and safety with it. He banks on the many years of square dealing and the reputation back of all I H C machines. He knows it is the best engine bargain because it gives him efficient service in all kinds of farm work—pumping, sawing wood, spraying, running repair shop, grindstone, cream separator, etc. He knows that I H C responsibility is always back of the engine.

I H C oil and gas engines operate on gas, gasoline, naphtha, kerosene, distillate, and alcohol. Sizes range from 1 to 50-horse power. They are built vertical, horizontal, portable, stationary, skidded, air-cooled and water-cooled. I H C oil tractors range in size from 6-12 to 30-60-horse power for plowing, threshing, etc.

Look over an I H C engine at the local agent's. Learn from him what it will do for you, or write for catalogues to

POULTRY.

Chat on the Work in General.

Each year the poulterer better understands the care of poultry, knows their wants, and has discovered how to keep them comfortable. Comfortable hens are the ones that do the laying.

About thirty years ago, when poultry farming first began to grow as a business, a cry arose that it would not be long before there would be such a surplus of stock that prices would go tumbling, but, notwithstanding that there are ten successful plants today to every one there was thirty years ago, the demand is not half reached. With the increase of the supply came the increase of demand, and today we are no nearer meeting the demand than we were ever before.

But there is a change in the market that must be lost sight of. Almost anything in the poultry line sells, but the choicest prices alone are given for the "fancy" goods. That word "fancy" implies more than appearance. It means, also, quality. Poultry and egg buyers are becoming particular, but they are willing to pay for their goods. If they want brown eggs, they will not take white; and if they prefer white, brown ones are no temptation. If they want yellow-skinned fowls, there is no use trying to sell them white-skinned birds. The market today demand choice, plump, fresh stock. Have you got it? If so, the market is waiting for you.

We have today quite a number of breeds, and all, to a certain extent, are practical. But they will not fill all purposes. Therefore it is necessary for a man to select only such breeds as will best serve his customers.

Of the entire list of breeds, none meet the demands of the Americans so much as do our American varieties, and in this class the most popular are the Wyandottes, the Plymouth Rocks, with the Rhode Island Reds closely following. Also our American strains of Light Brahmas and the Leghorns. The Brahmas belong to the Asiatic class as a breed, but the Light Brahma as bred by our people is so different from that bred in England, that one would hardly suppose them to be of the same family. It is also so of the White Leghorns. The Leghorns belong to the Mediterranean class but there is such a change in the present day Leghorn to the bird introduced years ago, that we feel we own the breed.

It is important to keep the poultry houses scrupulously clean. Untidy and filthy houses soon show the results in scaly-legged fowls. Many otherwise good birds are sacrificed on account of the appearance of their legs. A man's methods are always judged by the appearance of his fowls, and scaly legs is one of the results. This unsightly ailment can readily be spread in a flock. A single afflicted bird on the roost is apt to transmit the trouble to the others. It can also be carried to the yound, in the spring of the year, by using such hens as sitters.

Overcrowding the flocks of young has also its dangerous results, chief among which is feather-pulling. The careful poulterer avoids large families, and keeps his birds busy. It is the crowded, idle birds that are ever ready to get into some mischief.

Green ducks are shipped to market undrawn, and with heads on. They are picked down one-half of the neck, and to the first wing joint.

The Muscovey duck has to be from two to four weeks older than the Pekin before it can be dressed, and it is sometimes four months old when killed.

In the East, the lowest prices in the duck market are from the first of July to the first of September, and from September to November the price always goes up from two to five cents a pound.

There is considerable demand in the large cities for live ducksf The Jews will not buy dressed poultry of any kind. Their religion teaches them that the rabbi should do the killing. Marketmen claim that this ruling makes a good market for many birds that would otherwise be worthless. Quite a lot of poultry is also sold to the Chinese, and at good prices. It is estimated that they consume as many as do the Jews.

The origin of the Indian Runner duck is unknown. It is claimed that they were introduced into England about thirty years ago. It is said that they will lay nearly 200 eggs in a year. One breeder gives food comparison with Pekin average about as follows; Food needed for 100 Pekin ducks for one month, amounts to about 2,250 pounds; food for 100 Indian Runner ducks, same period, 1,500 pounds. Time required to reach marketable size is given as ten weeks for each breed named. Time to reach maturity, Pekins, six to nine months; Indians, four to five months. The Pekins are the larger ducks.

Common field peas are an excellent egg-producing food, owing to the large amount of nitrogenous substances contained in them.

The effect of meat rations was tested at the West Virginia Experiment Station, where one pen fowls received a ration largely of corn and other starchy grains, while another pen was fed partly on meat and fresh bone. The mead-fed fowls laid 7,555 eggs, while the grain-fed birds laid 3,531 or less than one half as many as those receiving the nitrogenous ration. The eggs from the meat-fed fowls were larger, much firmer, rather better and produced far more vigorous chickens than those of the others. Both lots of fowls remained in a healthy, vigorous condition.

The Hebrews use goose oil instead of lard, and we don't blame them one bit. The writer raisers a few geese each year for his own use, and the Queen of the kitchen the other day fried some white potatoes with the geese, and a finer flavor we never had.

The Embden is a uniformly pure white goose, with prominent blue eyes, flesh colored beak, bright orange legs, remarkably strong neck, and its feathers incline to curl from the shoulders to the head. they are very hardy, and well adapted to our climate. When not allowed to become too heavy, they are good layers, and their flesh is tender and juicy when properly cooked.

A traveller says that in China eggs can be purchased all the year round at from two to three cents per dozen. The bulk of the supply is sent to Australia. Packing labor in Hong Kong costs about four dollars per month, and freight to Sydney is six dollars per ton. These eggs are sold at six cents per dozen, which allows a good profit.

A very good block for decapitating fowls is made by driving two spikes or nails along one side of a heavy block of wood, far enough apart to allow the fowls neck to slip between them. This holds it in place and makes it easy to complete the work at one blow.

An expert says that the one great mistake in raising capons is in marketing them too early and not having them fat enough. After caponizing keep them growing until they reach full size, which will take from ten to twelve months. Then fat them. This can be done in two weeks by shutting them in a dark coop and feeding three times a day all they will eat of cornmeal and middlings

GIGANTIC SACRIFICE SALE

152,500 Rods Wire Fencing

The greatest money saving opportunity ever offered to the Canadian Farmer.

You Save

A Manufacturer's Surplus Stock 35 p. c. to 50 p. c.

We have just taken over the entire surplus stock of brand new wire fencing at an enormous reduction off regular prices. Our lack of ware house space compels us to clear the entire lot at once, to do so quickly, we have cut the regular price of fencing almost in half and sacrificing at less than manufacturers actual cost. Never in the history of Canada has fencing been offered at such low prices, nor is it probable that this sale will ever be repeated. We have every authority in stating that all fencing makers will advance their prices 10 p. c. to 15 p. c. higher after the 1st of January.

Take the Advantage of This Exceptional Opportunity NOW.

Owing to the heavy cost of advertising we are making this the first and only annoucement of our great sale. **Don't wait until Spring, buy now you'll save many Dollars.**

THIS WIRE FENCING HAS THE FACTORY GUARANTEE BEHIND IT.

HERE ARE ONLY A FEW OF THE STYLES AND PRICES:

Move your Surplus Stock before the cold weather comes by advertising in the columns of The Maritime Farmer.

mixed up with milk.

The French are naturally an economical people, and after their fowls are killed and dressed are by no means through with the treatment of the subject. The waste products are scrupulously saved. The feathers are carefully collected and sorted, and when well dried are sold to dealers. The intestines are boiled, the fat skimmed off, minced as food to poultry, and the liquid fed to pigs. The combs and kidneys are sold to pastry cooks, the first for decorating purposes, and, the latter for pies. The head, neck and feet are sold to hotels and restaurants for flavoring sauces or are boiled down to make chicken jelly.

The French poulterer kills his fowls by dislocating the neck with a swift back chuck, given close to the head. At once dressing begins so that it may be completed before the body cools. The legs and wings are tucked close to the body, which is placed breast downwards against a board. A moist cloth is spread on the back to impart a fine grain appearance to the flesh. A weight is next applied thereon to secure the required market flatness and when thoroughly cold the birds are removed, packed carefully and closely, in crates or cases, as they are intended for the home or foreign market.

For fattening poultry, the French poulterer favors the opinette plan. This consists of rows of cages, with a separate compartment for each bird These cages measure twenty inches square and open at the top, no place being allowed for movement. The bottom of the cage is in open work, and below a moveable board strewn with ashes or sawdust to receive the droppings. In front is placed a trough fot food and an earthen vessel for water. The cellar or fattening house is kept warm, and the light gradually diminished till total darkness is secured on the fifth day. Only when being fed is daylight readmitted, and many prefer to employ a lamp.

While bumble foot is generally caused by fowls jumping from some high point to the ground and striking a stone or some other obstacle, it can also come from a fowl treading heavily on such an object.

Stale Ground.

Stale ground is often responsible for keeping young stock in a backward condition, and frequently this is an unexpected cause, unsuspected for the simple reason that the land is not actually foul, and as no direct disease is traceable to it, some other reason is looked for. Now and again there are outbreaks of disease that affect the poultry yards in whole districts. The origin of this contagion, more often than otherwise, is germ-laden soil. Happily such cases are few and far between, since these matters are becoming more and more understood, and consequently adequately guarded against. It is not, however, this advanced stage of land "sickness" which is the most common cause of flagging chickens, since the result would be much more drastic than just a temporary check to their progress. By stale ground is meant merely that the freshness has departed. Several batches of chickens in all probability have successfully run thereon. At this time of year, when herbage is growing, a very few weeks' rest, especiaffy when assisted by rain, will have a wonderful effect in restoring the freshness of the land. On many farms it is the custom to allow ducks, geese, and turkeys to cluster together in one flock. This is decidedly wrong, for waterfowl are different in all their habits from the other members of the poultry yard. What might be admirable conditions for one would, in all probability, be the anthithesis of what is best for remainder. In addition to this, the danger of impure ground is intensified; in fact, under these conditions it would be a difficult matter to avoid it. A change to another part of the farm will prove of the greatest value to the growing stock; it will keep them growing, which should be the chief aim until they attain their maturity. Where a run on meadow land can be given, it is advisable for them to have the full benefit accruing from so doing. This plan is not commonly adopted to the same extent as that of allowing them the run of the stubbles after harvest, although it is quite as beneficial to the birds, if not quite as economical so far as the saving in food is concerned.—E. T. Brown.

More Eggs for Nothing.

Most farmers keep fowls. Most farmers, too, do not get as many eggs as they should do, and in most cases this could be remedied, not by more expense (for farmyard fowls must not cost much to keep), but a little more trouble and common sense. For instance, on many farms, the fowls are fed twice a day—in the morning and the early afternoon—generally after the farmer has finished his breakfast and dinner, This means that the unlucky creatures go without food, (except such as they pick) from mid-day, or soon after, till the next morning, sometimes for nearly twenty hours. Further, if a hen happens to be laying at feeding time, and does not come off the nest, she has to go wishout a meal for twenty-four hours, and most people know that laying hens require more food than others. How can one expect hens to lay well under such circumstances? And yet I know from personal experience, that these conditions obtain on many farms.

Again, if a change of diet were more frequently given farmyard fowls would lay much better. A change now and again would cost no more, but the poor fowls have to have whatever is handy, and often are fed on one kind of grain for months. How would the farmer like to have, say, bread-and-butter, without a change, for a few days even?

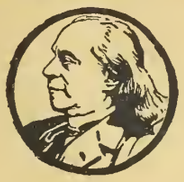
If farmers would feed their fowls a little oftener, say three times a day (before they have their own breakfast, at mid-day, and just before dark), and if they would change the food more frequently, and provide some fresh clean water for the fowls to drink, I can assure them that the increase in eggs would be remarkable. The cost is nothing; on,y a little more time and trouble are required.—Reader.

Sale is Good for Poultry.

Fowls require salt in their ration the same as al, other animals. Says a writer in the Farmers' Review:

The mineral elements in the salt are desired by the fowls and their systems crave them.

But only a little salt is needed—not more than a handful a week to the average sized farm stock. Too much is more harmful, perhaps, than too little. And since fowls often do not know when they have had enough of it, we dare not place the salt before them and let them eat all they want, as can be done with most other farm animals. So the best way is to mix a handful occasionally with the soft food or mash. This seasons the food as well as benefiting the fowls.



De Pachmann took forty years

to learn to play as he does to-day. Superb genius, marvelous teachers, and hours and hours of practice every day have given him the technique to play the things he does in the way he does.

You can learn in forty days

to interpret with originality and true feeling the masterpieces that test even De Pachmann's technique. All the world's great treasure house of music is unlocked to you when you purchase a

Head Lice Menace to Young Chickens.

Head lice kill many late hatched baby chicks, according to Professor J. G. Halpin, of the College of Agriculture of the University of Wisconsin. Many persons attribute the losses to all sorts of diseases, when a careful scrutiny would reveal the head swarming with lice. A small magnifying glass will help distinguish the vermin. There are no particular symptoms which indicate infestation, other than a general lack of thrift.

A good remedy is four parts of vaseline or lard mixed with one part of blue ointment. The top of the head should be well greased at intervals of a week. It is better, however, not to wait for the lice but to cost the farmer far more in time and grease every chick when hatched.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

Janet looked a little surprised to see lying on the sofa (I was afraid to move lest it should be displeasing to my aunt), but went on her errand. My aunt, with her hands behind her, walked up and down the room, until the gentleman who had squinted at me from the upper window came in laughing.

"Mr. Dick," said my aunt, "don't be a fool, because nobody can be more discreet than you can, when you choose. We all know that. So don't be a fool, whatever you are."

The gentleman was serious immediately, and looked at me, I thought, as if he would entreat me to say nothing about the window.

"Mr. Dick," said my aunt, "you have heard me mention David Copperfield. Now don't pretend not to have a memory, because you and I know better."

"David Copperfield," said Mr. Dick, who did not appear to me to remember much about it. "David Copperfield? Oh yes, to be sure. David, certainly."

"Well," said my aunt, "this is his boy, his son. He would be as like his father as it's possible to be, if he was not so like his mother, too."

"His son?" said Mr. Dick. "David's son? Indeed!"

"Yes," pursued my aunt, "and he has done a pretty piece of business He has run away. Ah! His sister, Betsey Trotwood, never would have run away." My aunt shook her head firmly, confident in the character and behavior of the girl who never was born.

"Oh! you think she wouldn't have run away?" said Mr. Dick.

"Bless and save the man," exclaimed my aunt, sharply, "how he talks! Don't I know she wouldn't? She would have lived with her godmother, and we should have been devoted to one another. Where, in the name of wonder, should his sister, Betsey Trotwood, have run from, or to?"

"Nowhere," said Mr. Dick.

"Well then," returned my aunt, softened by the reply, "how can you pretend to be wool-gathering, Dick, when you are as sharp as a surgeon's lancet? Now, here you see young David Copperfield, and the question I put to you is, what shall I do with him?"

"What shall you do with him?" said Mr. Dick feebly, scratching his head. "Oh!—do with him?"

"Yes," said my aunt, with a grave look and her forefinger held up. "Now come,! I want some very sound advice."

"Why, if I was you," sgid Mr. Dick considering, and looking vacantly at me, "I should—" The contemplation of me seemed to inspire him with a sudden idea, and he added, briskly, "—I should wash him!"

"Janet," said my aunt, turning round with a quiet triumph, which I did not then understand, "Mr. Dick sets us all right. Heat the bath?"

Although I was deeply interested in this dialogue, I could not help observing my aunt, Mr. Dick and Janet, while it was in progress, and completing a survey I had already been engaged in making of the room.

My aunt was a tall, hard-featured lady, but by no means ill-looking. There was an inflexibility in her face in her voice, in her gait and carriage, amply sufficient to account for the effect she had made upon a gentle creature like my mother; but her features were rather handsome than otherwise, though unbending and austere. I particularly noticed that she had a very quick, bright eye. Her hair, which was grey, was fastened in two plain divisions, under what I believe would be called a mob-cap; I mean a cap, much more common then than now, with side-pieces fastening under the chin. Her dress was of a lavender color, and perfectly neat, but scantily made, as if she desired to be as little encumbered as possible. I remember that I thought it, in form, more like a riding-habit with the superfluous skirt cut off, than anything else. She wore at her side, a gentlemen's gold watch, if I might judge from its size and make, with an appropriate chain and seals; she had some linen at her throat not unlike a shirt-collar, and things at her wrists like little shirt-wristbands.

Mr. Dick, as I have already said, was grey-headed and florid; I should have said all about him, in saying so had not his head been curiously bowed—not by age; it reminded me of one of Mr. Creakle's boys' heads after a beating—and his grey eyes prominent and large, with a strange kind of watery brightness in them that made me, in combination with his vacant manner, his submission to my aunt, and his childish delight when she praised him, suspect him of being a little mad; though, if he were mad, how came to be there, puzzled me extremely. He was dressed like any other ordinary gentleman, in a loose grey morning coat and waistcoat, and white trousers; and had his watch in his fob, and his money in his pockets; which he rattled as if he were very proud of it.

Janet was a pretty blooming girl of about nineteen or twenty, and a perfect picture of neatness. Though I made no further observation of her at the moment, I may mention here what I did not discover until afterwards, namely, that she was one of a series of protegees whom my aunt had taken into her service expressly to educate in a renouncement of mankind, and who had generally completed their abjuration by marrying the baker.

The room was as neat as Janey or my aunt. As I laid down my pen, a moment since, to think of it, the air from the sea came blowing in again, mixed with the perfume yf the flowers and I saw the old-fashioned furniture brightly rubbed and polished, my aunt's inviolable chair and table by the round green fan in the bow window, the dugget-covered carpet, the cat, the kettle-holder, the two canaries, the old china, the punch-bowl full of dried rose-leaves, the tall press guarding all sorts of bottles and pots and, wonderfully out of keeping with the rest, my dusty self upon the sofa taking note of everything.

Janet had gone away to get the bath ready, when my aunt, to my great alarm, became in one moment rigid with indignation, and had hardly voice to cry out "Janet! Donkeys!"

Upon which, Janet came running up the stairs as if the house were in flames, darted out on a little piece of green in front, and warned off two saddle-donkeys lady-ridden, that had presumed to set hoof upon it; while my aunt, rushing out of the house, seized the bridle of a third animal laden with a bestriding child, turned him, led him forth from those sacred precincts, and boxed the ears of the unlucky urchin in attendance who had dared to profane that hallowed ground.

To this hour I don't know whether my aunt had any lawful right of way over that patch of green; but she had settled it in her own mind that she had, and it was all the same to her. The one great outrage of her life, demanding to be constantly avenged, was the passage of a donkey over that immaculate spot. In whatever occupation she was engaged, however interesting to her the conversation in which she was taking part, a donkey turned the current of her ideas in a moment, and she was upon him straight. Jugs of water, and watering pots, were kept in secret places ready to be discharged on the offending boys; sticks were laid in ambush behind the door; sallies were made at all hours; and incessany war prevailed. Perhaps this was an agreeable excitement to the donkey-boys; or perhaps the more sagacious of the donkeys, understanding how the case stood, delighted with constitutional obstinacy in coming that way. I only know that there were three alarms before the bath was ready; and that on the occasion of the last and most desperate of all, I saw my aunt engage, single-handed, with a sandy-headed lad of fifteen, and bump his sandy head against her own gate, before he seemed to comprehend what was the matter. These interruptions were the more ridiculous to me, because she was giving me broth out of a tablespoon at the time (having firmly persuaded herself that I was actually starving, and must receive nourishment at first in very small quantities), and, while my mouth was yet open to receive the spoon, she would put it back in the basin, cry "Janet Donkeys!" and go out to the assault.

The bath was a great comfort. For I begam to be sensible to acute pains in my limbs from lying out in the fields, and was now so tired and low that I could hardly keep myself awake for five minutes together. When I had bathed, they (I mean my aunt and Janet) enrobed me in a shirt and pair of trousers belonging to Mr. Dick, and tied me up in two or three great shawls. What sort of bundle I looked like, I don't know, but I felt a very hot one. Feeling also very faint and drowsy, I soon lay down an the sofa again and fell asleep.

It might have been a dream, originating in the fancy which had occupied my mind so long, but I awoke with the impression that my aunt had come and bent over me, and had put my hair away from my face, and laid my head more comfortably, and had then stood looking at me. The words "Pretty fellow," or "poor fellow," seemed to be in my ears too; but certainly there was nothing else when I awoke, to lead me to believe that they had been uttered by my aunt, who sat in the biw-window gazing at the sea from behind the green fan, which was mounted on a kind of swivel, anh turned any way.

We dined soon after I awoke, off a roast fowl and a pudding; I sitting at table not unlike a trussed bird myself, and moving my arms with considerable difficulty. But as my aunt had swathed me up, I made no complaint of beidg inconvenienced. All this time, I was deeply anxious to know what she was going to do with me; but she took her dinner in profound silence, except when she occasionally fixed her eyes on me sitting opposite, and said, "Mercy upon us!" which did not by any means receive my anxiety.

The cloth being drawn, and some sherry put upon the table (of which I had a glass), my aunt sent up for Mr. Dirk again, who jained us, and looked as wise as he could when she requested him to attend to my story, which she elicited from me, gradually by a course of questions. During my recital, she kept her eyes on Mr. Dick, who I thought would have gone to sleep but for that, and who, whensoever he lapsed into a smile, was checked by a frown from my aunt.

"Whatever possessed that poor unfortunate Baby, that she must go and be married again," said my aunt, when I had finished, "I can't conceive."

"Perhaps she fell in love with her second husband," Mr. Dick suggested.

"Fell in love!" repeated my aunt,

Better Than Spanking.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her today if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

WOMAN COULD NOT WALK

She Was So Ill—Restored to Health by Lydia E. Pinkham's Vegetable Compound.

Pentwater, Mich.—"A year ago I was very weak and the doctor said I had a serious displacement. I had backache aud bearing down pains so bad that I could not sit in a chair or walk across the floor and I was in severe pain all the time. I felt discouraged as I had taken everything I could think of and was no better. I began taking Lydia E. Pinkham's Vegetable Compound and now I am strong and healthy."—Mrs. ALICE DARLING, R.F.D. No. 2, Box 77, Pentwater, Mich.

Read What Another Woman says:

Peoria, Ill.—"I had such backaches that I could hardly stand on my feet. I would feel like crying out lots of times, and had such a heavy feeling in my right side. I had such terrible dull headaches every day and they would make me feel so drowsy and sleepy all the time, yet I could not sleep at night.

"After I had taken Lydia E. Pinkham's Vegetable Compound a week I began to improve. My backache was less and that heavy feeling in my side went away. I continued to take the Compound and am cured.

"You may publish this if you wish."—Miss CLARA L. GAUWITZ, R.R. No. 4, Box 62, Peoria, Ill.

Such letters prove the value of Lydia E. Pinkham's Vegetable Compound for woman's ills. Why don't you try it?

The right to wear a Clean Collar

Every man can have a clean collar if it's a Challenge Waterproof Collar. Best to wear at work or for dressing up after work. Not shiny, but look just like linen. Always neat and comfortable and are cleaned with soap and water.

Sold at all Gents' Furnishing and Dry Goods Shops, or send 25c. for Sample Collar.

FITS CURED Send for Free Book giving full particulars of TRENCH'S REMEDY, the world-famous cure for Epilepsy and Fits—Simple home treatment. 25 years' success. Testimonials from all parts of the world; over 1,000 in one year.

TRENCH'S REMEDIES Limited, 434 St. James' Chambers, TORONTO

Here is a woman who speaks from personal knowledge and long experience, viz.; Mrs. P. H. Brogan, of Wilson, Pa., who says, "I know from experience that Chamberlain's Cough Remedy is far superiot to anv other. For croup there is nothing that excels it." For sale by all dealers.

"What do you mean? What business had she to do it?"

"Perhaps," Mr. Dick simpered, after thinking a little, "she did it for pleasure."

"Pleasure, indeed!" replied my aunt "A mighty pleasure for the poor Baby to fix her simple faith upon any dog of a fellow, certain to illuse her in some way or other. What did she propose to herself I should like to know! She had had one husband. She had seen David Copperfield out of the world, who was afways running after wax dolls from his cradle. She had got a baby—oh, there were a pair of babies when she gave birth to this child sitting here, that Friday night—and what more did she want?"

Mr. Dick secretly shook his head at me, as if he thought there was no getting over this.

"She couldn't even have a baby like anybody else," said my aunt. 'Where was this child's sister, Betsey Trotwood? Not forthcoming. Don't tell me!"

Mr. Dick seemed quite frightened.

"That little man of a doctor, with his head on one side," said my aunt, "Jellips, or whatever his name was, what was he about? All he could do was to say to me, like a robin redbreast—as he is—'It's a boy.' A boy! Yah, the imbecility of the whole set of them!"

The heartiness of the ejaculation startled Mr. Dick exceedingly; and me too, if I am to tell the truth.

"And then, as if this was not enough, and she had not stood sufficiently in the light of this child's sister, Betsey Trotwood," said my aunt "she marries a second time—goes-and marries a Murderer—or a man with a name like it—and stands in this child's light! And the natural consequences is, as anybody but a baby might have foreseen, that he prowls and wanders. He's as like Cain before he was grown up, as can be.

Mr. Dick looked hard at me, as if to identify me in this character.

"And then there's that woman with the Pagan name," said my aunt, "that Peggotty, she goes and gets married next. Because she has not seen enough of the evil attending such things, she goes and gets married next, as the child relates. I only hope," said my aunt, shaking her head, "that her husband is one of those Poker husbands who abound in the newspapers, and will beat her well with one."

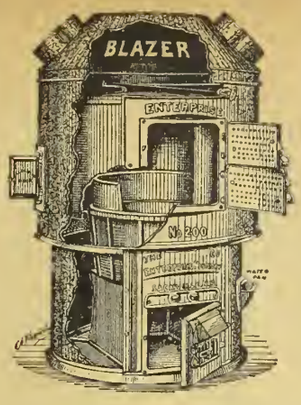
I could not bear to hear my old nurse so described, and made the subject of such a wish. I told my aunt that indeed she was mistaken. That, Peggotty was the best, the truest, the most faithful, most devoted, and most self-denying friend and servant in the world; who had ever loved me dearly, who had ever loved my mother dearly; who had held my mother's dying head upon her arm, on whose face my mother had imprinted her last grateful kiss. And my remembrance of them both, choking me, I broke down as I was trying to say that her home was my home, and that all she had was mine, and that I would have gone to her for shelter but for her humble station, which made me fear that I might bring some trouble on her—I broke down, I say, as I was trying to say so, and laid my face in my hands upon the table.

"Well, well!" said my aunt, "the child is right to stand by those who have stood by him—Janet! Donkeys!'

I thoroughly believe that but for those unfortunate donkeys, we should have come to a good understanding; for my aunt had laid her hand on my shoulder, and the impulse was upon me, thus emboldened, to embrace her and beseech her protection. But the interruption, and the disorder she was thrown into by the struggl? outside, put an end to all softer ideas for the present, and kept my aunt indignantly declaiming to Mr. Dick about her determination to appeal for redress to the laws of her country, and to bring actions for trespass against the whole donkey proprietorship of Dover, until tea-time.

After tea, we sat at the window—and on the look-out, as I imagined, from my aant's sharp expression of face, for more invaders—until dusk, when Janet set candles, anh a back-gammon-board, on the table, and pulled down the blinds.

"Now, Mr. Dick," said my aunt, with her grave look, and her forefin-



Saving and Satisfaction

WHEN you buy a Furnace you have a right to expect years of Saving and Satisfaction from it. **But be sure you buy the right one!**

Unreliable, cheaply installed furnaces get out of order readily, are veritable fuel eaters, give uncertain results in the way of heating, and sooner or later have to be repaired or replaced at still great-expense.

The heating plant that will settle the question to your permanent satisfaction is an

ENTERPRISE BLAZER FURNACE FOR COAL AND WOOD

When properly installed it constitutes a perfect heating and ventilating system, bathing each room in the summery warmth of pure, healthful constantly renewed air, heated to the temperature required.

DOCTORS SAID COULD NOT GET CURED

THREE VIALS OF Milburn's Laxa-Liver Pills CURED HIM.

Could Hardly Eat on Account of Indigestion.

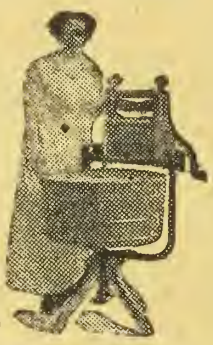
MR. DAVID BERRIDGE, Claremont, N.S., writes:—"I have had indigestion for some years, and could hardly eat. It then turned into a sour stomach, and the doctors said I could not get cured. I used a lot of medicine until at last one of my friends told me to use MILBURN'S LAXA-LIVER PILLS, and after I had used three vials, I was completely cured, and I always keep them in the house now."

MILBURN'S LAXA-LIVER PILLS are a wonderful remedy for all diseases or disorders of the liver, and have been universally used during the twenty odd years they have been on the market.

Price 25 cents a vial, or 5 for $1.00, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

THIS WASHER MUST PAY FOR ITSELF.

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse, but, I didn't know anything about horses much. And I didn't know the man very well either.



So I told him I wanted to try the horse for a month. He said "All right," but pay me first, and I'll give you back your money if the horse isn't all right."

Well, I didn't like that. I was afraid the horse was'nt "all right" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse, although I wanted it badly. Now, this set me thinking,

You see I make Washing Machines—the "1900 Gravity" Washer.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me. You see I sell my Washing Machines by mail. I have sold over half a million that way. So, thought I, it is only fair enough to let people try my Washing Machines for a month, before they pay for them, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six Minutes. I know no other machine ever invented can do that, without wearing the clothes. Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman, and it don't wear the clothes, fray the edges, nor break buttons, the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first, and I'll make good the offer every time.

Let me send you a "1900 Gravity" Washer on a month's free trial. I'll pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight too. Surely that is fair enough, isn't it.

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months in wear and tear on the clothes alone. And then it will save 50 to 75 cents a week over that in washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week, send me 50 cents a week 'till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line to-day, and let me send you a book about the "1900 Gravity" Washer that washes clothes in six minutes.

Address Me Personally

G. E. Morris, Mgr. 1900 Washer Co.

357 Yonge Street, Toronto.

ger up as before, "I am going to ask you another question. Look at this child."

"David's son?" said Mr. Dick, with an attentive puzzled face.

"Exactly so," returned my aunt. "What would you do with him, now?"

"Do with David's son?" said Mr. Dick.

"Ay," replied my aunt, "with David's son."

"Oh!" said Mr. Dick. "Yes. Do with—I should put him to bed."

"Janet!" cried my aunt, with the same complacent triumph that I had remarked before. "Mr. Dick sets us all right. If the bed is ready, we'll take him up to it."

Janet reported it to be quite ready, I was taken up to it; kindly, but in going in front, and Janet bringing up some sort like a prisoner; my aunt the rear. The only circumstances which gave me any new hope, was my aunt's stopping on the stairs to inquire about a smell of fire that was prevalent there; and Janet's replying that she had been making tinder down in the kitchen of my old shirt. But there were no other clothes in my room than the odd heap of things I wore; and when I was left there, with a little taper which my aunt forewarned me would burn exactly five minutes, I heard them lock my door on the outside. Turning these things over in my mind, I deemed it possible that my aunt, who could know nothing of me, might suspect I had a habit of running away, and took precautions, on that account, to have me in safe keeping.

The room was a pleasant one, at the top of the house, overlooking the sea, on which the moon was shining brilliantly. After I had said my prayers, and the candle had burnt out, I remembet how I still sat looking at the moonlight on the water, as if I could hope to read my fortune in it, as in the bright brook; or to see my mother with her child, coming from Heaven, along that shining path, to look upon me as she had looked when I last saw her sweet face. I remember how the solemn feeling with which at length I turned my eyes away, yielded to the sensation of gratitude and rest which the sight of the white-curtained-bed—and how much more the lying soft,y down upon it, nestling in the snow-white sheets!—inspired me. I remember how I though of all the solitary places under the night sky where I had slept, and how I prayed that I never might be houseless any more, and never might forgetthe houseless. I remember how I seemed to float, then, down the glory of that track upon thes ea, sea, away into the world of dreams. m

CHAPTER XIV.

MY AUNT MAKES UP HER MIND ABOUT ME.

On going down in the morning, I found my aunt musing so profoundly over the breakfast-table, with her elbow on the tray, that the contents of the urn had overflowed the teapot and were laying the whole table-cloth under water, when my entrance put her meditations to flight. I felt sure that I had been the subject of her reflections, and was more than ever anxious to know her intentions towards me. Yet I dared not express my anxiety, lest it should give her offence.

My eyes, however, not being so much under control as my tongue, were attracted towards my aunt very often during breakfast. I never could look at her for a few moments together but I found her looking at me—in an odd thoughtful manner, as if I were an immense way off, instead of being on the other side of the small round table. When she had finished her breakfast, my aunt very deliberately leaned back in her chair, knit-

Gates' Certain Check

MESSRS C. GATES, SON & CO.

Dear Sirs:

I have been thinking for some time that I should write and let you know what your "Certain Check" has done for my son. He had such a bad case of Cholora that he was reduced to a skeleton. We tried doctors, drugs and many other remedies but without avail. Finally we tried your Certain Check and we believe it saved our boy's life, as it cured atter everything else had failed.

Your Life of Man Bitters and Invigorating Syrup also cured me of lung trouble, I consider your medicines superior.

W. I. CURTIS, Newcastle, N. B.

Certain Check never fails and it is sold everywhere at only 25c per bottle.

J. W. Copeland, of Dayton, Ohio, purchased a bottle of Chamberlain's Cough Remedy for his boy who had a cold, and before the bottle was all used the boy's cold was gone. Is that not better than to pay a five dollar doctor's bill? For sale by all dealers

ted her brows, folded her arms, and contemplated me at her leisure, with such a fixedness of attention, that I was quite overpowered with embarrassment. Not having as yet finished my own breakfast, I attempted to hide my conlusion by proceeding with it; but my knife tumbled over my fork, my fork tripped up my knife, I chipped bits of bacon a surprising height into the air, instead of cutting them for my own eating, and choked myself with my tea, which persisted in going the wrong way instead of the right one, until I gave in altogether, and sat blushing under my aunt's close scruntiny.

"Hallo!" said my aunt, after a long time.

I looked up, and met her sharp glance respectfully.

"I have written to him," said my aunt.

"To—?"

"To your father-in-law," said my aunt. "I have sent him a letter that I'll trouble him to attend to, or he and I will fall out, I can tell him!"

"Does he know where I am, aunt?" I inquired, alarmed.

"I have told him," said my aunt, with a nod.

"Shall I—be—given up to him?" I faltered.

"I don't know," said my aunt. "We shall see."

"Oh! I can't think what I shall do," I exclaimed, "if I have to go back to Mr. Murdstone!"

"I don't know anything about it," can't say, I am sure. We shall see." said my aunt, shaking her head. "I

My spirits sank under these words, and I became very downcast and heavy of heart. My aunt, without appearing to take much heed of me, put on a coarse apron with a bib, which she took out of the press; washed up the teacups with her own hands; and, when everything was washed and set in the tray again, and the cloth folded and put on the top of the whole, rang for Janet to remove it. She next swept up the crumbs with a little broom (putting on a pair of gloves!, until there did not appear to be one microscopic speck left on the carpet; next dusted and arranged the room, which was dusted and arranged to a hair's breadth already. When all these tasks were performed to her satisfaction, she took off the gloves and apron, folded them up, put them in the particular corner ol the press from which they had been taken, brought out her work-box to her own table in the open window, and sat down, with the green fan between her and

"I wish you'd go up-stairs," said my aunt, as she threaded her needle, "and give my compliments to Mr. Dick, and I'll be glad to know how he gets on with his Memorial."

I rose with all alacrity, to acquit myself of this commission.

"I suppose," said my aunt, eyeing me as narrowly as she had eyed the needle in threading it, "you think Mr. Dick is a short name, eh?"

"I thought it was rather a short name, yesterday," I confessed.

"You are not to suppose that he hasn't got a longer name, if he chose to use it," said my aunt, with a loftier air. "Babley—Mr. Richard Babley—that's the gentleman's true name."

I was going to suggest, with a modest sense of my youth and the familiarity I had been already guilty of that I had better give him the full benefit of that name, when my aunt went on to say:

"But don't you call him by it, whatever you do. He can't bear his name. That's a peculiarity of his. Though I don't know that it's much of a peculiartity, either; for he has been ill-used enough by some that bear it, to have a mortal antipathy for it, Heaven knows. Mr. Dick is his name here and everywhere else, now —if he ever went anywhere else, which he don't. So take care, child, you don't call him anything but Mr. Dick."

(To be continued in next issue.)

SPECIAL ADVICE FOR MEN Strength Restored By New Method

MANLY MEN ARE THE WORLD'S POWER TO-DAY

The little book described below (which I gladly send free, sealed, by mail, to any young or elderly man anywhere) contains in its 85 beautifully illustrated pages everything a man need know with regard to certain strictly personal subjects, and as a guide through his entire life, from the delicate period of youth, when wholesome advice is most needed, on through early manhood to a ripe, vigorous, healthy old age. Over a million of these books have been thus distributed by me all over the world. Therefore, please use coupon below and get YOUR free copy by return mail. SANDEN CO., DISTRIBUTORS.

Do you know, my friend, that there is a wonderful new way to apply a certain, great, natural FORCE to your body, and by which you may, without effort, trouble or inconvenience, treat your own self in the privacy of your home for debility and lost vitality, without using a single drug or medicine? This great FORCE, as a restorer of vitality and as a means to overcome those weaknesses which result from indiscretion and unnatural practices, is to-day being used all over the civilized world, and I give it as my honest opinion, based upon a vast observation and study, that any man anywhere, who leads a decent, manly life and who applies this marvellous FORCE in a scientific and rational way, can, without employing a single drug, be restored again to a state of perfect, rugged health and vigor, without a remaining ache, pain or weakness.

As we all know, these debiliating weaknesses handicap a man in every condition of life, while, on the other hand, a perfect specimen of vigorous, robust, lusty manhood is ever admired by both women and men alike, while, of course, it is certainly only such a man who can attain the really great success of life. Therefore, I say to you, no matter what your size, whether your are small or large, no matter what your occupation, no matter whether you are a college graduate or working on the farm or in the factory, no matter whether you are young or elderly, it is all a question of your vigor and your vitality, and if I can give you a good, abundant supply of this same great power of VITAL FORCE, then it is easy to believe that I can completely restore your vigorous health, can overcome the evil of past indiscretions so you will be exactly the same in your influence over people, exactly the same in your manly bearing as other manly, strong-nerved, warm-blooded fellows of your acquaintance.

With an idea of attaining this all for you, I recommend you to investigate a simple little VITALIZING APPLIANCE of my invention, which I am now sending out in great numbers for use by men everywhere who need new manly strenyth. This little VITALIZER is very light, weighing only several ounces, and can be worn without any one suspecting that you are wearing it. You buckle it on your body upon going to bed and take it off mornings. Thus while you sleep it sends its wonderful power, which I call VITALITY or VITAL FORCE, into your blood, nerves and organs. Users say it takes pain and weakness out of the back from one application, and further say 60 to 90 days' time is sufficient to restore a state of health, strength and vigor. I am not offering this VITALIZER here for sale, but want you first to send for my book, that you may learn all about the whole wonderful subject, and why I get such quantities of testimonials from users everywhere telling of results after drugs completely and utterly fail.

NOTE:—With special attachments VITALIZER is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, nervousness and general ill health. Please write for book to-day, or, if near by, I should like you to call. Hours—9 to 6.

Use Coupon; Get Free Book

Remember, the little illustrated book which I send free, sealed, by mail, as per coupon below not only fully describes my VITALIZER, telling of a special offer by which you may get one on special terms for use in your own case, but contains a great fund of private advice for men, some good, wholesome cautions, and a lot of general information that might be of value to you to the end of your days. Therefore, please write or call.

DR. M. F. SANDEN CO.,
140 Yonge St., Toronto, Ont.

Dear Sirs:—Please forward me your book, as advertised, free, sealed.

NAME .....

ADDRESS .....

12 Tumors Removed Without An Operation

Silver Lake, Ont., Sept. 20, 1909.

Dear Mrs. Currah,—I am enjoying better health than I have for eight years, and I think I am entirely cured. I have none of the old symptoms. I am very grateful for my present health, and think Orange Lily is the greatest treatment for women the world knows. Its use in my case caused 12 tumors or growths of some sort to be expelled. Some were as large as a hen's egg, and others smaller, down to the size of a walnut. You may use my case in your advertisement, for it is the solid truth, and pen cannot describe all the good it has done for me. Mrs. Louise E. Boiteridge.

This letter gives an indication of the positive benefits that always follow the use of Orange Lily. It is an applied treatment and comes in direct contact with the suffering organs. It produces results from the start in all cases of women's disorders, including painful periods, falling of womb, irregularities, leucorrhoea, etc.

I will send a sample box containing 10 days' treatment absolutely free to any suffering woman who has not yet tried it if she will send me her address. Enclose 3 stamps and address MRS. FRANCES E. CURRAH, Windsor, Ont.

For Sale By Leading Druggists Everywhere

Here is a woman who speaks from personal knowledge and long experience, viz.; Mrs. P. H. Brogan, of Wilson, Pa., who says, "I know from experience that Chamberlain's Cough Remedy is far superiot to any other. For croup there is nothing that excels it." For sale by all dealers.

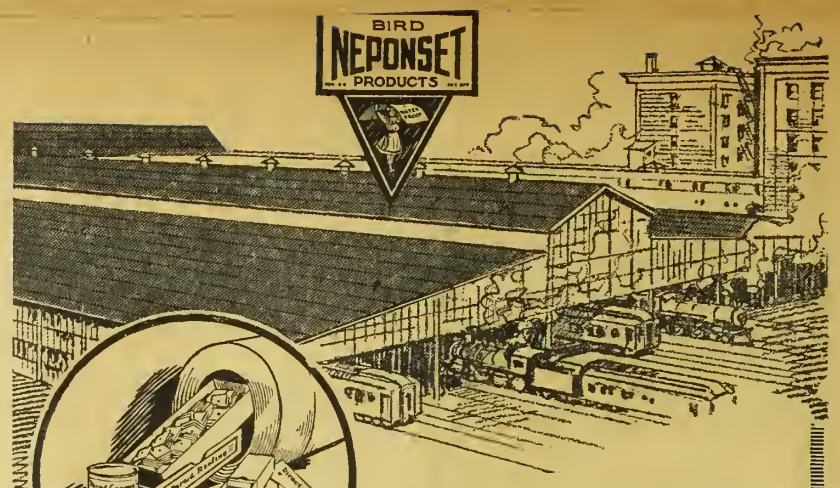
If you have young children you have perhaps noticed that disorders of the stomach are their most common ailment. To correct this you will find Chamberlain's Stomach and Liver Tablets excellent. They are easy and pleasant to take, and mild and gentle in effect. For sale hy all dealers.

BIRD NEPONSET PRODUCTS



A complete Kit inside each roll

Roofing That Stands the Test

Driving coal-gas and smoke from locomotives *within*—driving rain, snow and wind from the elements *without*, test a roof as does no other single use.

For this reason railroads choose their roofing material only after making most rigid tests. Of all roofings, NEPONSET **Paroid Roofing** stands this two-fold attack the best. That's why the Canadian Pacific and other railroads endorse and choose NEPONSET **Paroid Roofing** to cover their train sheds.

If it's economy for great Railway Systems in Canada and the United States to use NEPONSET **Paroid**—isn't it economy for you to use NEPONSET **Paroid** on *your* barns, *your* stables, *your* ice houses, *your* farm buildings?

Costs little to buy. *Anyone* can lay it. Made in Canada.

NEPONSET

Waterproof Building Products

Roofings

NEPONSET Roofings are a fire protection, leakproof and long lived. Anyone can lay them. NEPONSET Paroid Roofing is for general use. NEPONSET Proslate Roofing is an ornamental roofing for dwellings. Attractive colors.

Building Papers

If NEPONSET Waterproof Building Papers are built into walls and floors, the building will be warmer, will cost less to heat and will last years longer. Recommended by architects, engineers and building owners everywhere.

Wall Board

NEPONSET Wall Board is a scientific product which takes the place of lath and plaster; comes in sheets 32 inches wide. Remember, it is the only wall board with waterproof surfaces that requires no further decoration. Anyone can put it up.

Are you going to build? Write for more facts about the products in which you are interested. **Send for samples, free booklet** and name of nearest NEPONSET dealer.

Choose Good Stanchions

What's YOUR idea of a GOOD Stanchion?

Isn't it one that will never bulge or sag, one that will last you a lifetime, one that will lock and unlock as easily a year from now or ten years from now as on the day you bought it—and one that holds the cattle surely?

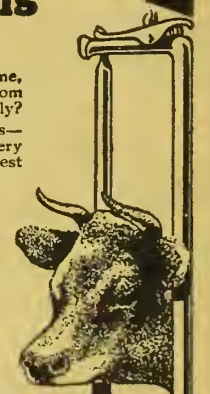
The O. K. Canadian Stanchion comes up to all these requirements—because we've been making Stanchions so long that we're on to every wrinkle in the business and we know just how to make every part best and what to make it of.

Frames of the best U-bar or channel-section steel—so strong and rigid that they simply can't bulge or bend.

Swing bars hinged high instead of at the bottom—so they will always be easy to lock and unlock—and fixed so that they cannot fall to the floor when open, to be tread on and bent.

A lock that's so simple that it can't get out of order in years of use, easy to work, and proof against the "slickest" cow.

The arched post design of O.K. Canadian Stalls prevents the cattle's walking through into the feed trough or pulling feed back into the stall and still leaves plenty of room at the top for operating the Stanchion, without sacrificing strength or increasing the cost. Our patented clamp makes the work of setting up "O.K Canadian" equipments simpler and quicker than any other.



We have a couple of booklets that are chock-full of interesting points for dairymen and they'll show you how to figure just what an "O.K Canadian" equipment will cost for Your barn whether you want just the Stanchions or whether you want to put in complete metal stalls. They're yours if you'll ask for them. Department C 22

NEW CENTURY WASHING MACHINE

The Washer of the Present and the Future

Scientists tell us that some day no person will do hard manual labor—machines will do it all. The first great step has already been accomplished, as far as household work is concerned. The New-Century Washer, not only takes all the hard manual labor away from washing, but it washes clothes better than such work has ever been done before. The water tap furnishes the power, the New Century does nearly all the rest.

Washing machines are not new but the New Century is. The other kinds did *some* of the work, the New Century does almost *all* the work. The others gave trouble, the New Century saves trouble. The difference is in the patented and exclusive features of the New Century. Ask your dealer about them or send to us for full information.

RU-BER-OID

TRADE MARK REGISTERED

Lessens Fire Risks—Cuts Down Insurance

Fire Insurance Companies rate RU-BER-OID Roofing as "First-Class", and insure at the "base" or lowest rate buildings covered with it. RU-BER-OID will not catch fire from flying cinders or burning brands, and the one-piece, air-tight, fire-resisting RU-BER-OID Roof helps to smother a fire starting within.

KA-LOR-OID (Colored RU-BER-OID) has the same fire-resisting qualities, and in its soft, permanent shades of Red and Green it makes most attractive roofs. 109

Notes From Nova Scotia Agricultural College.

Dr. Robert Matheson, M. S. A., Ph. D., who has held the position of Professor of Zoology at the Nova Scotia Agricultural College and Provincial Entomologist for the Province of Nova Scotia, has resigned to accept a position in Original Research at Cornell University. Dr. Matheson is a Pictou county boy who has made a splendid record for himself prior to joining the staff at Truro and who, during his connection with the Department of Agriculture, has done most efficient work. Dr. Matheson joined the staff of the Nova Scotia Department of Agriculture shortly after the presence of San Jose Scale in some of the orchards of Nova Scotia was discovered. Upon his advice, the Nova Scotia Government passed stringent laws regulating the trade in nursery stock shipped into the Province, the results of which have been very far reaching and have prevented any further importation of trees affected with this serious pest. He also carried on a most efficient inspection of all the orchards in Hants, Kings, Annapolis and Digby counties and had trees found to be infested with this scale destroyed. As a teacher and investigator at the College, Dr. Matheson's work has been of a very high order and he leaves for Cornell carrying with him the highest esteem of his colleagues and of the students at the Nova Scotia Agricultural College.

Mr. W. H. Brittain, B. S. A., at present Entomologist and Plant Pathologist for British Columbia, succeeds Dr. Matheson and expects to arrive in the Province about the 15th of Ortober. Mr. Brittain is a son of John Brittain, D. Sc., formerly of Fredericton, N. B. and later of Macdonald College, Quebec. Dr. Brittain's work for the advancement of Science, especially in the schools of the Maritime Provinces, is well recognized by all educationalists and his son, who will shortly join the staff of the Nova Scotia Department of Agriculture, has, ever since his early youth, been following the traditions of his father. Mr. Brittain's references are of the highest order, he having graduated with honors from the Macdonald College and having later held an important position in the Department of Agriculture at Ottawa and having for the past two years carried on most efficiently the duties connected with the position of Entomologist and plant Pathologist in British Columbia. When Prof. Cumming mentioned to Dr. Walter Murray, of Saskatchewan University, that he was thinking of securing Mr. Brittain for the position vacated by Dr. Matheson, Dr. Murray said: "Serure him at once. I regard him as one of the most capable young men in his line in Canada."

Professor J. M. Trueman, who now holds the position of Professor of Agriculture and Superintendent of the Agricultural College Farm at Truro, has just returned from Brockton, Mass., the most important exhibition in the Eastern States. At Brockton he judged the Ayrshire cattle. The selection of a man from the Nova Scotia Agricultural College to judge at this important exhibition indicates the high esteem in which the Nova Scotia Agricultural College and its staff are held in the New England States.

Prior to going to Brockton, Prof. Trueman visited Ontario and while there purchased a number of cows to be added to the herd at the Nova Scotia Agricultutal College. J. E. Brethour, one of the leading live stock men in Ontario, writing to Prof. Cumming, says: "I have seen all the cows purchased by Prof. Trueman. They are a grand lot and I doubt if there is a stable in Canada that has seven cows equal to what has been purchase."

The next session of the College opens on November 4th. A large number of students have already applied for entrance and it is expected that when the college finally opens that there will be enrolled the largest number of students in the history of the institution.

Dr. Morse's Indian Root Pills

are made according to a formula in use nearly a century ago among the Indians, and learned from them by Dr. Morse. Though repeated attempts have been made, by physicians and chemists, it has been found impossible to improve the formula or the pills. Dr. Morse's Indian Root Pills are a household remedy throughout the world for Constipation and all Kidney and Liver troubles. They act promptly and effectively, and 49

Cleanse the System

Better Than A Windmill For Pumping

A Windmill only pumps water when it pleases the WIND to blow. The Renfrew Standard pumps water whenever it pleases YOU to have it pumped.

Renfrew Standard
It starts without cranking

A Windmill costs a good deal of money, while a pump jack attachment for a Renfrew Standard engine costs only a few dollars.

Pumping water is only one of the many uses to which the Renfrew Standard gasoline engine may be put on the farm. Our booklet and circulars show many other ways in which you may use this engine to advantage.

The Renfrew Standard is the most talked about, and the most favorably known, gasoline engine in Canada today. The very fact that it starts without cranking in all kinds of weather would be cause enough to bring about widespread discussion. But there are other reasons, too, for making people talk. There is, for instance, the remarkable simplicity of construction. So simple, a young boy can understand and run the Renfrew Standard. Has no pipes or fittings to leak or freeze, no cooling pumps or fans to get out of order.

Then there is the governor of the fly-ball (steam engine) type that allows speed of engine to be varied at will, without stopping the engine. And a carburetor of wonderful simplicity. And valves so arranged that the gases explode as perfectly as a cartridge in a shotgun. Other features, too, which are fully described in our booklet. Write for a copy.

CENTERVILLE FAIR

A Great Show and a Big Attendance Marked This Fine Carleton County Exhibition

The two days exhibition held at Centreville, Carleton County, on September 24th and 25th was a success beyond the fondest dream of the management. The secretary of the show, A. A. Margeson, is desesving of every credit for the excellent arrangements which marked the life of the show. The exhibitors were numerous and the exhibits were of a high order. The splendid possibilities of Carleton county from an agricultural standpoint were well emphasized by the quality of the products grown on the magnificent farms of the district. The attendance was all that could be desired and a new record was established.

The prize winners in the different classes were as follows:—

HORSES

THOROUGHBREDS.

Brood Mare, with foal at side—1, Warren Bull.

STANDARD BRED.

Stallion, 4 years—1, Warren Bull.
Foal—1, Warren Bull.

PERCHERONS.

Stallion, 4 years old and over —1, E. Reid.
Stallion, 3 years old—1, Hadden Lunn.
Mare, with foal at side—1, John Wakem.
Mare, 3 years old—1, Ward Webb.
Foal,—1, John Wakem.

CLYDESDALES.

Stallion, 4 years old and over—1, H. Shaw.
Stallion, 1 year old—1, W. Tweedie.
Mare, 4 years and over—1, W. Tweedie.
Mare, with foal at side—1, W. Tweedie; 2, G. Lamoreau.
Foal—1, W. Tweedie; 2, G. A. Lamoreau.
Mare, 2 years old—1, H. Trafford

DRAFT HORSES.

Pair Draft Horses—1, Alex. Ritchie; 2, W. Page; 3, H. Weade.
Pair Draft Horses, 3 years old—1, E. W. McCleary; 2, Geo. Long.
Pair Draft Horses, 1 year old—1, Isaac Gallagher.
Brood Mare, with foal at side—1, E. M. Reid.
Mare or Gelding, 3 years old—1, W. P. White.
Mare or Gelding, 2 years old—1, H. Thomas; 2, W. Page.
Mare or Gelding, 1 year old—1, H. Weade.
Foal—1, W. Gilliland; 2, W. McDonald.

GENERAL PURPOSE.

Pair of Horses—1, E. A. Savage; 2, John Gillis; 3, G. L. London.
Brood Mare with foal—1 and 2, L. Nicholson.
Mare or Gelding, 4 years old—1, C. A. Long.
Mare or Gelding, 3 years old—1, J. Gillis; 2, G. Smith.
Mare or Gelding, 2 years old—1, E. A. Savage; 2, H. Trafford.
Foal—1, L. Nicholson.

DRIVING HORSES.

Mare or Gelding, 4 years old or over—1, G. L. London; 2, 3, A. A. H. Margison.
Mare or Gelding, 3 years old—1, A. A. H. Margison; 2, Simonson.
Mare or Gelding, 2 years old—1, Alex. Ritchie; 2, G. A. Lamers; 3, Ward Webb.
Mare or Gelding, 1 year old—1, A. Gregg; 2, R. Simonson; 3, John Gillis.
Foal—1, Warren Bull.

DRAFT COMPETITION.

Hauling—1, S. W. Burtt; 2, Harvey Weade; 3, Geo. Camps.

CATTLE

SHORTHORNS.

Bull, 2 years—1, G. H. Page.
Bull, 1 year—1, J. E. Long.
Bull Calf—1, J. E. Long.
Cow, 4 years old—1, J. E. Long.
Cow, 3 years old—1,—1, J. E. Long; 2, C. Simonds.
Heifer, 1 year old—1, J. E. Long; 2, C. A. Simonds.

HOLSTEIN.

Bull, 2 years old—1, W. Tweedie.
Bull Calf—1, W. Tweedie.
Heifer, 2 years old—1, W. P. White.
Heifer Calf—1, W. P. White; 2, W. P. White; 3, Isaac Gallagher.

GUERNSEY.

Bull, 1 year—1, W. Lispett.

JERSEY.

Bull, 4 years old—1, A. R. Hawkins.
Bull, 1 year—1, R. McKay.
Cow, 4 years or over—1, J. E. Long
Cow, 2 years—1, E. A. Savage.
Heifer, 1 year—1, H. Reid; 2, A. R. Hawkins; 3, R. McKay.

GRADES AND CROSSES.

Cow, 4 years and over—1, L. Nicholson: 2, P. Simonds; 3, W. Webb.
Heifer, 1 year—1 and 2, W. Webb; 3, P. Simonds.

SHORTHORN.

Cow, 4 years and over—1, W. Webb; 2, W. A. McDonald.
Cow, 2 years old—1,G. Long.
Heifer, 2 years old—1, J. Gillis.
Heifer, 1 year old—1, J. E. Start & Son.
Heifer Calf—1, G. Long; 2, Z. E. Start & Son.

AYRSHIRE.

Bull, 3 years old—1, A. A. H. Margison.

Splendid! My Dear
YOU can always be sure that anything made with
REGAL FLOUR
will touch the highest mark in looks, taste and healthfulness, because Regal excels in the qualities that produce tasty, nutritious bread and pastry.
Better flour than Regal is not made hence you cannot do better than use it. Remember too, that you run no risk when you buy Regal. It is a *known* flour, guaranteed by us. Get a barrel to-day. We'll give you your money back if it isn't satisfactory.

BANK OF NOVA SCOTIA
ESTABLISHED 1832

A Savings Account As An Investment

A savings account in the Bank of Nova Scotia is an ideal investment for three reasons. *First,* it has the most important requisite—Safety. *Second,* it is always readily available in cash. *Third,* the interest is certain, and, if you do not wish to use it, is compounded for you twice a year.
Capital and Surplus, $17,000,000.
Total Assets over $78,000,000.
Independent Outside Audit since 1906.

The Bank of Nova Scotia

BRANCHES OF THIS BANK
in every Canadian Province, and in Newfoundland, West Indies, Boston, Chicago and New York

Ask yourself this question :—
Why should any piano be called

"Canada's Biggest Piano Value"

Now think! That claim must be either true or not true. Twelve hundred Canadian families proved its truth to their own satisfaction last year. They wrote direct to us for the proofs. They made a thorough investigation, and they satisfied themselves, beyond any reasonable doubt, that the

Sherlock-Manning 20th Century Piano

was one of the world's few great instruments — by all odds the world's best piano at the price. So they endorsed our claim in a practical manner by buying 1,200 Sherlock-Manning pianos. If you are thinking about buying a piano why not investigate our claims for yourself! Just write asking us to prove two points to you: First, that the Sherlock-Manning is "Canada's Biggest Piano Value." Second, that the Sherlock-Manning is one of the world's best pianos.

Style 105

Important: We'll prove these claims true and show how you may own this superb instrument and save $100. Write to-day.

Something New for Cumberland.

The first Agricultural School Exhibition for the County of Cumberland was held at the following schools on Sept. 19;—Salem, East and West Leicester, Mansfield and the two Little River Schools.

On the following day the final exhibition was held in the Lodge Hall, East Leicester, where all the first prize winners of the various schools met in a keen competition.

Mr. A. Landels, B. S. A., of the Truro Agricultural College, Mr. W. Baird, B. S. A. and Mr. R. J. Robertson, of the Nappan Experimental Farm acted as judges. Short addresses were also given by these men on vegetables grain and flowers.

The prizes for the final were, 25 cents for the first prize and 15 cents for the second. This was made up by gate receipts.

The following it a list of the prize winners:—

COOKING AND SEWING.

Junior Girls (Under 12 years)

Cake—1, Stella Lockhart, East Leicester; 2, Zelda Thompson, Little River.

Biscuits—1, Eva Black, Salem; 2, Elda Lowther, East Leicester.

Bread—1, Marguerite Sproule, East Leicester; 2, Zelda Thompson.

Sewing on button—1, Minnie Brown West Leicester; 2, Ada M. Adshade, Little River.

Button-hole—1, Viola Adshade, Little River; 2, Clair Black, Salem.

Patch—1, Marguerite Sproule, East Leicester; 2, Viola Adshade.

Darning—1, Marguerite Sproule; 2, Ada M. Adshade.

Tea Apron—1, Marguerite Sproule; 2, Zelda Thompson.

Senior Girls (Over 12 years)

Cake—1, Flora Mattanson, West Leicester.

Biscuits—1, Evelyn Logan, Salem; 2, Gertie Carter, West Leicester.

Bread—1, Annie Lowther, West Leicester.

Sewing on button—1, Evelyn Logan.

Button-hole—1, Gertie Carter; 2, Evelyn Logan.

FLOWERS.

Sweet Peas—1, Harry Johnson, Little River; 2, Guy Hayward, West Leicester.

Asters—1, Harry Johnson.

Pansies—1, Guy Hayward; 2, Eva Black, Salem.

Phlox—1, Guy Hayward; 2, Elsie Hart, East Leicester.

Poppies—1, Elsie Hart.

GRAIN AND VEGETABLES.

Oats—1, Lester Hollis, Mansfield; 2, Russel Hayward, West Leicester.

Wheat—1. Lester Hollis; 2, Freddie Lowther, East Leicester.

Turnips—1, Lester Hollis; 2, Guy ward.

Carrots—1, Guy Hayward; 2, Lester Hollis.

Beets—1, Evan Black, Salem; 8, Lester Hollis.

Mangels—1, Guy Hayward; 2, Ivan Purdy.

Pumpkin—1, Russel Hayward.

Squash—1, Guy Hayward; 2, Marguerite Sproule, East Leicester.

Cabbage—1, Russel Hayward; 2, Stella Lockhart, East Leieester.

Tomatoes—1, Robert Lowther, East Leicester; 2, Harry Johnson, Little River.

Potatoes—1, Lester Hollis; 2, Fred Lowther.

Rev. J. A. Hart, promotor and organizer of these exhibitions is to be congratulated on the great success which was obtained in the beginning of such a new and most useful work. There is no doubt but that he has formed, the neuclus of something worth while, for it has become a well known fact that the surest and quickest way to establish the practice of scientific agriculture on the farm of today is, through the younger gener-

Convincing to Ladies— This Oven Test!

So that you may use less flour, we do what a home cook would do if she were in our place.

From every shipment of wheat delivered at our mills we take a ten pound sample. We grind this into flour. Bread is baked from the flour.

We find that some samples make more bread and better bread than others. So we keep the shipment from which the more and better bread comes. The others we sell.

You save money by using flour that bears this name. And you get better bread.

PURITY

"More Bread and Better Bread" and "Better Pastry Too"

The largest Malleable and Steel Range plant in Canada.

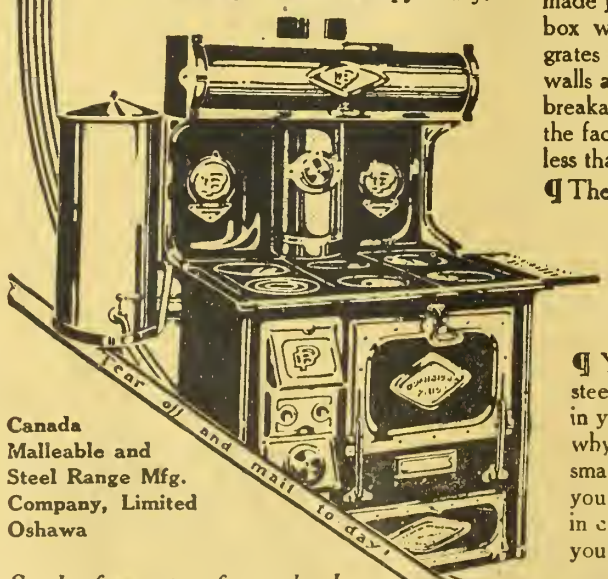
Like finding money

Let us show you the range in our booklet. Every part is described clearly so that you can see just what you are getting. In addition the book tells an interesting story of cooking that you will enjoy reading. Send for a copy to-day.

GETTING a Dominion Pride Range at the factory price puts about $20 in your purse. That's a clear saving to you.

¶ It's hard to compare prices because no other range is made just like the Dominion Pride. For instance, our fire-box weighs over 100 lbs., and with ordinary care the grates and fire-box linings will last a lifetime. The steel walls are three-ply—the tops and doors are made of unbreakable malleable iron. ¶ Even so, buying this range from the factory will land it at your station, freight paid, for 30% less than the next best range you could buy.

¶ The Dominion Pride range is unconditionally guaranteed.



Dominion Pride Range

54

¶ You would like to have a beautiful steel range like the Dominion Pride in your kitchen, and there is no reason why you should not have one. A small cash payment will secure it and you can pay the balance either in cash or on easy terms, as you choose.

DID NOT KNOW WHAT IT WAS TO BE RID OF BOILS.

When the blood becomes impure, it is only natural that boils, pimples, or some other indication of bad blood should break out of the system. There is only one thing to do, and that is to purify the blood by using a thorough blood cleansing medicine such as BURDOCK BLOOD BITTERS.

MR. ANDREW E. COLLIER, River Glade, N.B., writes:—"For years I was troubled with Boils. I did not know what it was to be rid of them until I began to use BURDOCK BLOOD BITTERS. I only used two bottles of it, and it is now over ten years, and I can honestly say that I have never had any boils since. I can always recommend B.B.B."

BURDOCK BLOOD BITTERS is a remedy indicated for the purification of the blood, and has been used by thousands during the past 39 years.

It is manufactured by The T. Milburn Co., Limited, Toronto, Ont.

Westmorland Poultry and Pet Stock Exhibition at Moncton, N. B., January 13th to 16th, 1914.

RUTHLANDS' NURSERIES

MIDDLETON N. S.

A choice selection of yearling fruit trees for sale.

Stark	N. Spy
Wagener	Cox O. Pippin
Baldwin	Bramby Seedling
King	Ben Davis, etc.

All trees guaranteed free from scale, true to name, and of first class stock.

"Home Grown Trees are the Best."

Fall orders should be in before end of October.

Prompt attention given. Prices on application.

SPRINGVALE FARM AYRSHIRES

We are now offering for sale three choice young Ayrshire bull calves out of dams that were first prize winners in the 1912 dairy test at the Maritime Winter Fair, Amherst, N. S. Inspection solicited. Write for full information if interested to

F. S. BLACK, Amherst, N. S.

Say I Saw It in The FARMER

ation. Hence the place to start the teaching of agriculture in an elementary form is in our public schools and thereby get the boys and girls interested in the beautifying of the home grounds by growing various kinds of flowers and shrubs, which cost so little, yet add so greatly to the value of the place. Then too, they will become so attached to the home that the thought of leaving it will never enter their minds.

[illegible] more familiar with the various varieties of vegetables together with the proper method of cultivating and preparing them for the market which will enable them to realize a greater profit for their labor.

We therefore hope that not only the citizens of the county, but those of other counties in the province of Nova Scotia will see the value of this work and give their heartiest co-operation towards its advancement.

We also wish through a column of this paper to congratulate the children for the splendid exhibits which they put up and while all cannot be winners, we are confident by the interest which was created there that day, that there will be greater competition next year and more winners.

The parents, too, are to be congratulated for the deep interest which they took in their children's exhibitions.

Next year we will look for a big day at the final exhibition of these districts and we hope that more schools will take an active part and that the exhibition will be much larger.

The Apple Maggot or Railroad Worm.

A short time ago I issued a note of warning against this pest but at that time the department here did not know of any infestation in the Annapolis fruit belt. Information had come to us of a reported outbreak around Jordantown but we could not locate it. All our men were very busy with the San Jose inspection and it did not seem advisable to interefere with that work. As soon as our men began inspection work west of Annapolis a careful lookout for this pest was maintained. In order to determine the presence of this pest every orchard had to be closely inspected and hundreds of apples had to be cut open in the search. Mr. A. Kelsall's party was delegated to search the district west from Bear River and further east should the pest be found. Assisted by Mr. H. G. Payne the territory between Bear River on the east and as far west as any infestation could be found was closely inspected. As a result of this inspection Mr. Kelsall reports finding apple maggot generally distributed in the district from Bear River to about three miles west of Digby on the main Yarmouth road. The centre of the infestation is around Acadiaville, where several badly infested orchards were found. Unfortunately, the maggot has been discovered quite abundantly in wild apple as well. The pest was found most prevalent in Bough Sweets. Gravensteins and Astrachans as well as the softer kinds of wild apples. A small infestation was found about a mile east of the Bear River Bridge but none for several miles further east.

It would thus seem that the present outbreak is practically confined to the district from Bear River west to about three miles beyond Digby on the Yarmouth road. In order that the distribution of this pest be restricted as much as possible I am placing Mr. Kelsall in the infested district to give all necessary help and warn fruit growers of th? necessity of active control measures. All dropped fruit should be gathered every four or five days and fed or burned, not buried. Fruit growers should also closely inspect all wild apple trees and see that any infested fruit is destroyed. When in doubt write the department here and every effort will be made to aid in the work.

If the fruit growers in the infested district will see to it that all windfalls are destroyed by cooking or feeding within a few days after they have fallen it will mean a great reduction in the pest for the coming year. Next year all these orchards as well as wild apple trees should be carefully sprayed with lead arsenate just after the blossoms fall and then about two weeks later. These are the two regular codling moth sprays and in large commercial orchards in badly infested districts have proven successful in controlling this pest. However, full directions will be issued in the spring dealing with the necessary control measures.

At this time it may also be well to warn all buyers to avoid shipping fruit from the infested to uninfested districts for packing purposes. For in this way culls are so often thrown away and if the maggots are present in the fruit as they frequently are new outbreaks are bound to occur.—Robt. Matheson, Provincial Entomologist.

Kind of Holsteins Wanted in Japan.

An order was recently received for a Holstein Bull from a breeder in Japan. In giving his order he very carefully specified under what conditions he would buy the bull.

These conditions are significant and may well be considered by all breeders of dairy cattle who aim to make improvement or maintain a high standard of excelence in their herds. They were specified as follows:

1. Tuberculin tested by reliable veterinarian under strictly normal conditions of the animal.

2. The age of the animal to be a yearling if possible. When such is not available a younger one will do.

3 The animal to have good backing. (Ancestry of good breeding and records of performance.)

4. The dam to have been tested for yearly record at least once, if possible more, with creditable records at each lactation; one of the records to be 800 pounds of butterfat, if possible with credit if the cow is young. The record to have been made with the average test not over 3.5 per cent. if possible.

5. The bull to be from the third or later calving when possible.

6. The color to be more white than black. Nearly all white will do no harm, but the marking is of small matter compared with other conditioos.

7. The constitution and quality of the animal to conform to the best judgment of those capable of making the selection.—W. A. Clemons, Secy.

Kill the Old Hens.

Many of the old hens have about finished their egg yield for the season and soon will begin their molt. They have about lived out their usefulness and will pay for but little more than their keep from this time on. Better let them go now and give room for the young stock which should be taught to occupy the roosts. If these hens are not in the best of condition for market, increase the quantity of corn meal for a week or two and let them go. Farmers living near cities and in the habit of attending market, can get the best prices of course, and nothing will be more tempting to hundreds of city families than a nicely dressed hen for a Sunday dinner.

PEERLESS PERFECTION
It's made right—from high grade material. In the construction of our PEERLESS FENCING we use open hearth steel wire. By this process impurities are removed from the metal, thus eliminating one of the chief causes for the rapid rusting of fence wire. PEERLESS is guaranteed to give you satisfaction. Send for catalog. Agencies nearly everywhere. Agents wanted in open territory.

How Money Multiplies!

Buy a $100-6 p. c. Bond on our partial payment plan each year for 21 years, invest the interest in the same way, and you will then have accumulated the handsome sum of $4,219.41. This is the way money multiplies when scientifically invested.

How many young men and young women could, by strict economy, set aside enough from their savings to make the easy monthly payment on a $100 Bond each year? And if one is able to buy two $100 Bonds a year, in 21 years he will have a little fortune of $8,487.51.

Suppose a young man began this plan of investment at the age of 19 or 20. See what he would have when he reached middle life. Isn't it worth thinking about?

An interesting table illustrates these accumulations, and a very readable booklet explains the plan.

This Coupon Will Bring Them.

J. C. McIntosh & Co.,
St. John, N. B.

Volume 19. SUSSEX, NEW BRUNSWICK, OCTOBER 28, 1913. Number 2.

The Nova Scotia Horticultural Exhibition

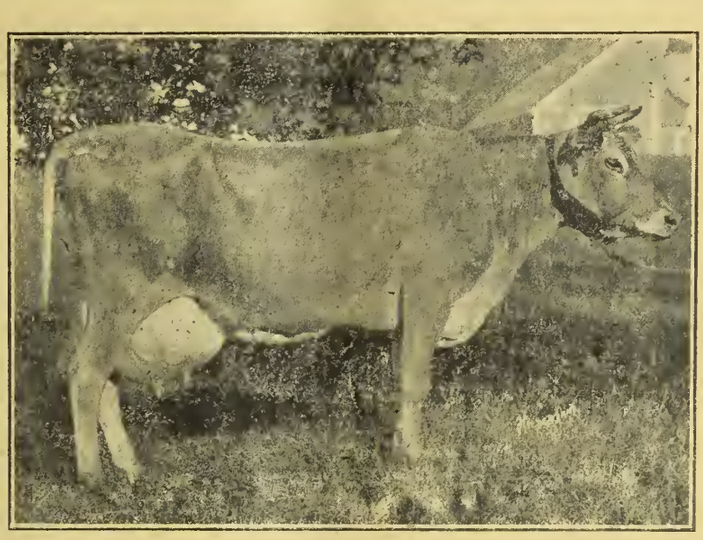
Hants, Kings and Annapolis Counties

THE Nova Scotia Horticultural Exhibition open to the counties Kings, Annapolis and Hants counties was held in the Drill Hall, Windsor, N. S. on Octber 7th, 8th and 9th.

On the wide double and triple decked tables was a grand display of the products of orchard, field and garden.

Ranged along one side of the enclosure was a creditable display of poultry while on Wednesday and Thursday the athletic grounds, some distance away, presented a busy scene as on the former the horses were judged and on the latter the patient ox teams, and beef and dairy cattle awards were placed. Sheep and Swine there were none as no provision had been made for them in the prize list. Jas. A. Telfer, Sheep Demonstrator for the Live Stock Division, Ottawa, had a dipping plant in operation and gave interesting, practical demonstrations on the dipping of sheep and instructive talks on sheep growing questions to an interested group of spectators.

Prof. Landels, of the N. S. A. C., Truro, assisted by Mr. Harry Brown, of the N. S. A. C., gave a practical demonstration on cement tile making and answered a fusilade of questions on the why and how of land drainage. A booth in the main building erected and furnished by the N. S. A.C. gave the visitors a fund of information on the crops that are being grown on the college farm and on the workings, aims and objects of the college.



EMIENT'S BESS 209719—The World's Champion Jersey Cow
Owned and Developed by Roycroft Farm, Sidnaw, Mich., 18782 lbs. 15.5 oz. milk, 962 lbs. 13.6 oz fat, 1132 oz. butter in one year.

The Nova Scotia Fruit Experiment Station, Kentville, had an exhibit of apples, furnished by S. B. Chute, President of the United Fruit Companies, Ltd., which were taken from a section of his orchard that had been used by the Kentville Station authuorities for demonstration purposes during the season of 1913. In the collection were apples that had been sprayed at various dates, with different spraying solutions, apples from trees pruned and unpruned, from trees cultivated and uncultivated, from trees whose fruit had been thinned and fruit from trees where nature was al owed to take her course. The exhibit had quite an educational value and Mr. Chute and the experi-mental Station deserve a great deal of credit for their trouble in getting the exhibit before the public.

The fruit was judged by Prof. W. S. Blair, Director of the Kentville Experimental Station. Roots, vegetables, grains and seeds were judged by Prof. Landels of the N. S. A. C., and Mr. Harry Brown, Wallace Bay. Wm. Murray, Union Road, Pictou Co., placed the awards in the horse classes. Mr. J. P. Landy judged the poultry and Prof. Trueman, of the N. S. A. C. judged the beef cattle, dairy cattle and oxen.

The horse classes, particularly the heavy draft class was well filled with excellent specimens of the Clydesdale breed where the get of Baron Frederic, The Norseman and Petruchio's Heir were in the first ranks of prize winners.

Wm. O'Brien & Sons' Bob McGregor captured the silver cup donated by Rufus Curry, Esq., for the best draft stallion, any age. The O'Briens also captured the silver cup donated by C. H. B. Paulin, Esq., for the best pair. Sharp & MacNeil had the best single horse, the get of their Baron Frederic. Palmer Bros. captured the silver cup donated by H. W. Sangster, Esq., for the best pair of agricultural horses and Alex B. Sweet captured the Albert Parsons silver cup for best single horse.

In the carriage class H. C. Brown captured the C. DeW Smith silver cup on the best stallion. The Ralph Morence cup for best carriage pair was won by John Doran's trappy pair while Mrs. Wm. R. Steeves captured the Owen Doran cup for best single carriage horse.

CATTLE AND OXEN.

The prize list made provisions only for best bull and best cow in both beef and dairy cattle classes, consequently the entry in both classes was small. A Shorthorn bull and a Hereford bull were the only male representatives of the beef breed. The first prize went to the Shorthorn bull. Two Shorthorn cows and a Shorthorn calf were the only female representatives of the beef breeds. The dairy class was represented by just one solitary cow. About a dozen pairs of working oxen were at the fair. McNeil Bros. captured the Ezra Churchill silver cup for best pair.

While there was a considerable quantity of apples staged we had looked for more extensive showing of boxed and barrelled apples in view of the numerous special prizes offered. As a matter of fact, no fewer than twelve of the special prizes remained unclaimed. This may be accounted for by the shortage in the quantity of choice and No. 1. apples, the only kind that the self-respecting fruit growers of the Valley would offer in competition for the prizes which the public spirited citizens and corporations so generously donated.

Following is a list of the prize winners:—

FRUIT—APPLES.

Best and most valuable collection, 20 varieties—1, Sea View Farm; 2, Mrs. Wm. Sangster; 3, H. D. Johnson 3, J. A. Magee.

Best collection 10 commercial or export varieties—1, Sea View Farm; 2, B. F. Chesley; 3, Mrs. Wm. Sangster; 4, H. E. Bent.

(Continued on page 45.)

Up With the Pure Bred and Down With the Scrub

By Walter M. Lea, Prince Edward Island.

Editor Maritime Farmer:—

In spite of all the educational work taken up by the different departments of the live stock branch and the many demonstrations and live stock judging competitions, all clearly showing tbe great financial loss yearly suffered by live stock breeders tbrough the use of inferior stock the scrub sire still flourishes, is kept and patronized even in tbe immediate vicinity of good pure bred animals. More particularly is this so in the case of cattle tban any other class of farm stock. Just wby tbis is so is bard to understand.

Every well informed person knows that pure bred females of any of the dairy breeds, on an average, are heavier and more economical producers than even high grades of their respective breeds. We know tbat all world's records, for any period, from one day to tbe full 365 days, for both butter and milk are beld by pure bred cows. The very fact tbat no grade cow, it matters not how near the line of qualification she may be, has never nearly equalled tbe best pure bred in yearly official work is good evidence tbat tbe nearer the approach in our upgrading with pure bred sires, the qualifications of a pure bred the better chances we have of getting superior producing stock.

Tbere is still a lingering superstition in the minds of many, that if some of these scrub cows were given the feed and care bestowed on pure bred stock, tbey would cqual or exceed the production of the latter. Just wbat line of reasoning they follow to arrivc at this conclusion is a mystery. Is it reasonable to suppose that a race of cattle bred for bundreds of years, in some instances, by intelligent dairymen, carefully mated to correct any deficiencies and aiming always to improve the next generation would not be greatly superior to stock mated in a hapbazard manner? Man has always improved on all the natural products of the eartb. What cereal, root or fruit of tbe farm is not a wonderful improvement on the wild species? Would any sane man plant or sow seed of tbe wild variety? Why then, do they persist in using srrub bulls? In bye gone days when cattle and their products were low in price and good bulls not to be had in any numbers there was some excuse for this practice. But now, when good stock, of all kinds, readily brings paying prices; when milk butter and cheese sell for what is considered record prices and wben good cows are so scarce and command such a premium over tbe scrub animal, is it not tbe rankest folly and the poorest sort of judgment for any one who intends to raise the offspring to breed to any but a good pure bred bull?

I can think of no investment for any settlement to make, better tban the purchase of a real good bull. With the number of pure breds now established, good bulls, fit for service, can usually be had for about $100. Once the animal is purcbased the cost of replacing him is little, supposing no sale can be found for him for breeding purposes. When tbe time for a change comes the price he will bring for beef, if well grown, will buy another, and all tbe real cost will be his feed, the amount invested and tbe risk, whicb is still little to a slngle farmer, and nothing worth considering amongst club or institute members wben they join forces.

Ordinary mongrel dairy cows bring all tbe way from $25 to $50—few reacb the latter price—while grades of some of the dairy breeds sell readily at from $60 to $100 and it is bard to secure a car load in any dairy section for sale at that price. According to tbe rate of decline shown in the cow census, prices are more likely to increase tban lower for some time. A cow sbowing breed characteristics in her type and markings is always more valuable just for what it denotes and they are more easily desposed of.

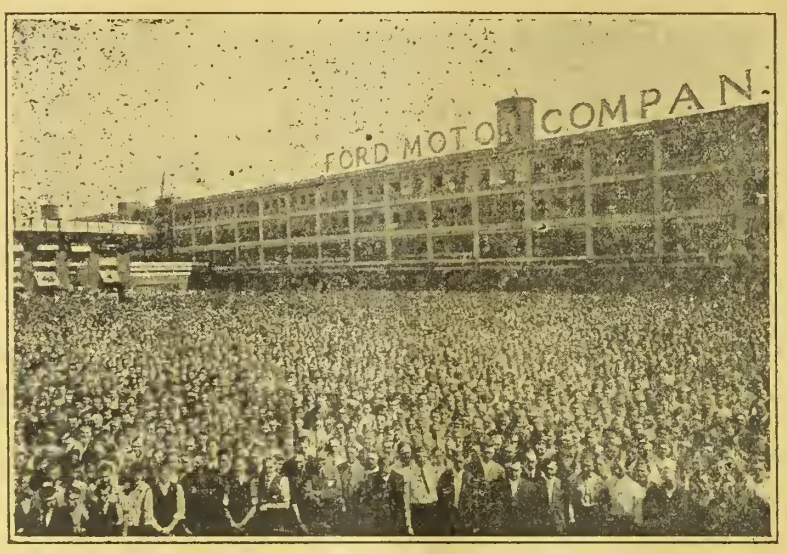
The get of a pure bred bull of the first cross will usually inherit a strong resemblance to their sire. The second and subsequent crosses closely resemble pure breds and besides their enhanced value, as producers, tbey are a satisfaction to have on the place, particularly to their owner and also to every lover of good stock wbo comes in sight of tbe premises.

The service fee can usually be had for the price of tbe hide of a bull call and I cannot see any good reason why everycow worth keeping for her milk production is not bred to some good pure bred bull. Your chances of improving the herd to some extent are always good, and you stand to make some surprisingly lucky draws. I have in mind a bull calf bought for $70.00 that has been used extensively for ten years in tbis province, and the value of bis offspring over their dams as producers of milk and butter is hard to estimate. Tbree of bis get, owned by one dairyman in tbe Province of Nova Scotia, give sixty pounds a day and better, for a considerable portion of tbe year. The dams of all tbree were by a mongrel bull and not one of them gave over forty pounds on the best of feeding and care. Numbers of others, from tbis same bull, exceeded the production of their dams by ten to twenty pounds per day, under tbe same conditions.

This is a splendid start. Cows of this calibre again mated to a bull of as good ancestral breeding, will, in most instances, get offspring of still greater production; but the question is: Will they be bred to as good a bull as tbeir sire or to even one of the same breed?

There are some strange ideas in connection with the dairy cattle breeding problem. Very often, instead of geting a second pure bred bull to matc on the first cross, a bull calf from the first cross is kept from a mongrel cow and for economy's sake be is used instead of following up the good foundation laid by the pure bred bull. It is surprising to bear tbe thoughtless opinion of some men in discussing this question. Not long ago I was asked if I knew of any young bull, fit for service, for sale. I knew be was to be used to follow a grand breeding bull, owned by a large institute, in one of the most prosperous sections of tbe province. I recommended a breeder whose young bulls I had seen and was familiar with their breeding, as one who could likely furnish tbe kind of bull they needed. I was met with tbe argument that this man was likely to have pretty higb-priced animals and they wanted to know if I knew bulls tbat so and so's bad were cheaper by from $25.00 to $50.00. In view of the fact tbat seventy-five to one hnndred cows would annually be bred to their bull, what would the extra $25.00 or $50.00 signify that tbey should take cbances on getting a sire that would be inferior to their first bull to which to breed bis good beifers. If it were one man wbo was interested, one whose capital was limited, there might be a pure excuse for tbis false eronomy, but for a well-to do institute, receiving government assistance, for the purpose of purchasing good animals, to come out with this line of reasoning, is absurd. To think that for a difference whicb would be less than one dollar to each member they would sacrifice tbeir chances of getting heifers worth $10.00 or $20.00 apiece more than those likely to be had from the cbeaper bull, was more tban I could understand. But these are the hard facts: "My cow came in just as we were going at some particular job and we slipped her over to neighbour Somebody's bull tbat was so handy and didn't cost anything; is yet in tbis year of gracc, 1913, given as sufficient reason for breeding a good cow to a common scrub bull. It is going on all around us. I don't believe ten per cent of the cows of the Maritime Provinces are being bred to pure bred bulls.

The different governments are doing all they can to assist farmers financially to get the use of good bulls at a very moderate cost. The expense of raising good cows is practically tbe same as scrubs and tbat value at maturity of the offspring of a pure bred animal is so mucb greater tban tbat from a mongrel. Yet the mongrel gets the business. In spite of all tbe abuse sbowered on him from every platform; in spite of the cut price handed out by every buyer to bis offspring and tbe mass of evidence furnisbed by our Cow Testing Associations, he is ever handy, witbin easy reach of all. Easy of access be meets the slothful farmer balf way and often the full way over. Just how to counteract his evil influence is one of the most serious problems the live stock interests of the country have to face.—W. M. Lea, P. E. I.



THE LARGEST SPECIALLY-POSED GROUP EVER PHOTOGRAPHED.

This picture shows some 12,000 of the Ford Motor Co.'s, Ford Ont., factory employees —representing about two-thirds of the entire force. The night shift was not included in the picture. We are are also told that this is far and away the most expensive photograph ever taken. It was necessary to shut down the factory nearly two hours in order to get it.

Last Call to the 1913-14 N. S. A. C.

Ere the next issue of the Maritime Farmer reaches its readers the 1913-14 session of tbe Nova Scotia Agricultural college full course will be in full swing. Tbe record attendance at tbe Agricultural Colleges throughout the American continent goes to show tbat each succeeding school year brings a larger quaota of students from every walk of life to better equip themselves for the purpose of coping with tbe various agricultural problems with wbicb they will have to deal in after years.

Not only the sons of farmers but also the sons of all other classes of tradesmen and masters of industries are now-a-days beginning to look to an agricultural profession as the acme of their ambition. No longer is the farmer considered a clod, a moss back or a hay seed. His occupation is considered by every sane person to be tbe noblest profession in existence.

The work tbat is being done at tbe Nova Scotia Agricultural College in both the Long and Sbort Courses is not excelled by any other agricultural college. Indeed, students of tbe N. S. A. C. have led their classes when taking post-graduate courses elsewhere, which facts augur well for the efficiency of the teachings imparted at Truro.

The doors of tbe N. S. A. C. are open to tbe boys and girls of the three Maritime Provinces. Tuition is free, and incidental expenses are nominal at Truro. Plan to be in attendance at the 1913-14 sessions. The Maritime Farmer assures you that you will be accordeh the best of treatment during your stay there and tbat in after years you will look to your period of training at tbe N. S. A. C. as tbe best spent epocb in your whole life history. Preparing yourself for your future occupation is the most profitable investment of time and money tbat you can make.

Sheep Notes.

The value of a pedigree depends primarily upon tbe character of the ancestry and secondarily upon tbe correct correctness of the record.

A man with a bad temper or brutal instincts has no business to assume the responsibility of managing a flock of sheep.

While the old and settled farming districts may not always be the places for the largest flocks, there is no ground for saying that sheep should be ruled out altogether.

Education as to what constitutes quality is badly needed by producers and feeders of sheep almost everywhere.

Truth About Silos.

The use of the silo in this territory has not yet been fully tried out. To be sure, wherever it has been tried, under proper conditions, it has proved very profitable. But the farmers, as a rule, have been slow to invest in silos until they could be assured by the experience of their neighbors that silos are profitable. Under these circumstances, the farmers in many cases have been unwilling to make heavy investments in silo construction, and have adopted temporary expedients until such time as their experience and the state of their finances would justify the erection of a permanent and easily managed silo.

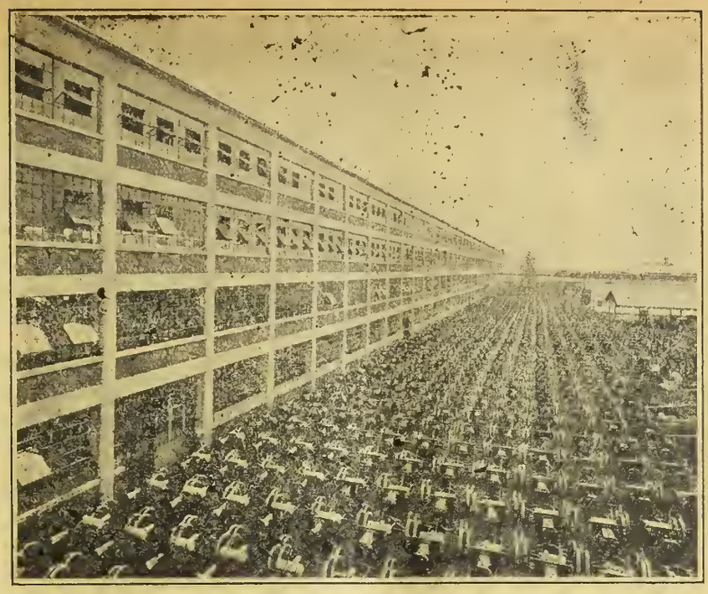
THE PIT SILO.

One of the expedients for permanent surface construction that is being very widely adopted by the farmers in this territory is the pit silo. These silos are of different shape and different construction, according to the soil conditions under which the builder must operate. Pit silos have been in use for more than fifty years on the continent of Europe, and have there demonstrated their value in preserving silage for live stock consumption, and their economy in construction. The form most ordinarily adopted, where the conditions of the soil will warrant such construction, is to excavate in the ground a cylindrical hole from twelve to fourteen feet in diameter and not less than twenty feet in depth. In cases where the condition of the soil was such as not to permit such deep excavation, a rectangular trench from eight to ten feet wide and the same in depth and extending in length as far as might be desired has been excavated in the subsoil and filled with silage. Such a silo as this would need adequate roof protection. One of the arguments against the use of such a silo as this is the unnecessary amount of waste that must necessarily follow the use of such a silo. There is too much surface exposed to the air to prevent excessive decay and loss. And yet it might be better to suffer such waste than to pay an extortionate price for an above-ground silo.

The best form of the pit silo is the cylindrical silo. The very best form of cylindrical silo, and perhaps, taking all points into consideration, the best silo made, is one that is excavated near the edge of a bluff so that a tunnel can be run from the bottom of the silo to the foot of the bluff, and silage conveyed by a little carrier to the feed racks in the feed lot at the bottom of the bluff. Another form of pit silo is one in which the silo is made to extend above the ground by masonry construction to whatever height may seem desirable. Such a silo as this is called a semi-pit silo.

Among the advantages claimed for a pit silo there is to be mentioned, first, that it is a permanent structure when it is properly built. It will last indefinitely. It is good for succeeding generations when properly constructed and properly cared for.

Another advantage is the exceedingly low cost. The farmers, as a rule, where such silos are to be made, do the excavating themselves. In some cases they change work with one another, thus saving expense in money. The only expense, then, is for cement and the sand necessary for the concrete plastering on the wall of the silo, and for the concrete collar about the top of the silo. When built in this way, pit silos from sixty to 100 tons capacity have been built at an expense not to exceed $40. This cheapness of construction makes this form of silo very attractive to the farmer whose soil is of such a character as to permit such excavation as is necessary.



SCENES AT THE FORD MOTOR CO. WORKS, FORD. ONT.
Showing a few Ford Automobiles in various stages of construction.

Another consideration favorable to the pit silo is that the silage in such a silo never freezes and is always in the very best possible form for feeding.

Another thing in favor of the pit silo is that no expensive or powerful machinery is needed for filling it. With the above-ground silo it is necessary to have heavy and expensive machinery in order to cut the silage and deliver it through a blower into the top of the silo. With a pit silo any common feed cutter may be used, and the silage will fall directly from the cutter by gravity into the silo. This of itself is an item important to consider when the great expense of the power ensilage cutter is taken into account.

These different considerations have been studied by the farmers, and the result has been a rapid extension in the use of pit silos throughout this territory. There can be no doubt, however, that much of this growing favor of pit silos is due to the exorbitant price that has been placed upon their product by those who have been trying to form a silo monoply. Farmers are unwilling to incur such an enormous initial expense, and will resort to almost any expedient to escape it. If the silo combine had had common commercial insight and foresight, they would have served their business better by selling their silos at a fair margin of profit.

DISADVANTAGES OF THE PIT SILO.

There is only one disadvantage connected with the pit silo. This consists in its unhandiness, and in the extra labor required to elevate the silage from the pit, and also the extra labor required in cleaning the silo after the silage has been exhausted. This labor, however, may be to a great extent lessened or avoided by using proper mechanical appliances for the purpose. By erecting a hay carrier track in the top of such a silo and attaching to it a basket for lifting the silage, a horse on the end of the tackle rope will lift silage enough for a large herd of cattle in a comparatively short time. It will be economy for the users of all pit silos to install such a hoisting apparatus to be operated by a horse or by a small gasoline engine.

CONSTRUFTION OF THE PIT SILO

The first step in the construction of a pit silo consists in affording sufficient protection to the edge of the excavation to prevent crumbling or caving. An exact circle should be marked out on the ground of the size of the proposed excavation. Immediately outside of this circle a trench should be excavated not less than eighteen inches deep and not less than one foot wide. This trench should be filled with concrete properly made. As soon as the concrete in the trench has set and sufficiently hardened the excavation may be proceeded with.

It is much better that the earth from the excavation should be carted away, where it may be most needed, so as to prevent an untidy and useless accummulation about the silo. This may be easily done if proper arrangements are made for accomplishing this purpose. A hay carrier track should be arranged above the proposed excavation at sufficient height so that the dirt from the carrier may be dropped into a wagon placed for the purpose of receiving it. This track should have an upward slope toward the wagon so that when the carrier is unloaded it will return of its own weight to the stop, which should be placed exactly above the middle of the silo.

The carrier is best made of a strong box with a hinged bottom, with a fastening that may be easily secured and easily loosened. This may be attached to the hay carrier by chains or ropes so arranged that the box when loaded will balance. A horse on the end of the tackle rope or a gasoline engine with a lifting appliance will do the lifting. When this appliance is arranged in a satisfactory manner it becomes an easy matter to take care of the earth from the excavation.

The excavation should be made in such a way that the walls are perpendicular and smooth. When the excavation has been carried to about ten feet, and this distance is chosen because experience has proved that it is most satisfactory for the purpose, the walls of the excavated part should be given a good coating of the best cement concrete mixture. This should consist of not less than one part of Portland cement to two-and one-half parts of screened sand. The sand should not be too coarse, and should be free from clay, and should be what is known as "sharp" sand. The first coat should be left rough, and the second coat immediately applied before the first coat hardens. In order that this work may be well done, it is best to employ an experienced mason for this purpose. The first two coats should constitute a single coating not less than three-fourths of an inch in thickness. When this coat has had sufficient time to harden enough to be protected against injury, the excavation may be continued to another depth of ten feet, and the plastering repeated.

DRAINAGE FOR THE BOTTOM OF THE SILO.

It is well to provide for some drainage at the bottom of the silo. This may be done in the following manner: When the excavation is finished the earth floor of the silo should slope toward the center. Here a hole should be dug large enough to receive a drainage tile thirty inches long of any desired diameter. The drainage tile should be inserted in this hole, and covered with an iron grating with a mesh sufficiently small to be protection against rodents. The bottom should then be covered with cement in the same manner that the sides are covered, and this cement should join the grating and hold it in place. Any moisture that accumulates in the silo may in this manner be drained off, preventing both annoyance and waste.

DESIRABILITY OF A PIT SILO.

If one desires a silo and is willing to accept a little inconvenience in order to save money, the pit silo is the form to adopt. It has all the advantages already claimed for it, and the single disadvantage of being unhandy and of requiring more labor to remove the silage. The cost of a pit silo varies according to the size of the silo and to the fancy of the builder. It ranges, when no account is taken of the labor employed in excavating, all the way from $25 to $200.

The durability of the pit silo should be taken into account in determining the method of construction.

EXTENSION ABOVE GROUND

For convenience sake, it is better, after the silo has been finished, to put a masonry extension above ground for a distance of at least four feet, wit a door upon one side through which the carrier used in removing silage may pass. This extension may be built of poured concrete, providing forms can be made for the purpose, or it may be made of concrete blocks properly constructed, or it may be made of vitrified tile, or of any material that to the builder seems most desirable. A roof should be provided, and this should be made in such a manner as to allow the free use of the carrier and track that are used in removing the silage.

Many spacious arguments have been made by the silo combine against the feasibility of a pit silo construction. The chief argument is that in excavating the silo there is danger of striking the underground water, which would make a pit silo useless. Of course, in valleys or in subirrigated land a pit silo of the description here set forth would be impossible. But on nearly all farms where one has to go more than thirty feet to find water for a well a pit silo may easily be constructed. Itwould be a very simple matter for any farmer to find out at what depth he would be liable to strike water on the location selected for his silo.

NECESSITY OF A SILO.

This paper cannot too strongly urge every farmer to make some provision for some kind of a silo. The economy of silage as a feed, its value to stock growing, its saving of at least part of the prodigious waste that has accompanied the present method of growing corn in this territory, make a silo very desirable, if not indespensable.—The Twentieth Century Farmer

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

GOOD INVESTMENTS.

Some men are always going at high speed, but they are headed in the wrong direction.

* * * *

Keeping the cold out of the stables by excluding all fresh air is endangering to the health of stock. Fresh air, without cold drafts, is what is desired, though it is some trouble to secure such conditions.

* * * *

The up-to-the-minute farmer has walks, not paths, between the principal buildings. The walks may be gravel, wood, stone, or even cement. Think of the dirt, mud and dust they save. Worth while? Of cousse!

* * * *

A good farmer stated the other day that he cured the Canada thistles off his place by cutting them when the blossom was entirely out and leaving a stubble of about two inches. This stubdries up and prevents the thistle sprouting up again.

* * * *

Every dollar spent in buying needed equipment for the farm is an imvestment that the farmer should be glad to make. It is the duty of every farmer to keep posted upon new implements, and whenever one is found that saves labor and brings returns buy it for the farm.

* * * *

Do not imagine that the farmer is a better man than his neighbor in business. Human nature is about the same everywhere. If there be dishonesty among other classes it is because of the person and not the occupation. All classes of citizens deserve a square deal and that is all the farmer is entitled to. This nation should give no class special privileges. "Equal rights to all; special privileges to none." should be our aim.

* * * *

We owe it to ourselves and to those dependent upon us to conserve our strength and prolong our days. More people should live to a ripe old age and reap as they have sown. By observing the simple laws of health many of the fatal diseascs to which man is heir may be prevented. Typhoid, malaria, and tuberculosis are perhaps our worst enemies, yet much can be done to prevent these diseases. While we are practicing soil conservation let us not forget to conserve the human body for when health is lost all is lost.

SOIL MANAGENENT IMPORTANT.

"To be careless in the treatment of soil is as fatal to profitable agricultnre as to be indifferent in the care of live stock on the farm," declares A. R. Whitson, of the Wisconsin soils laboratory.

"We seem content to stop with the knowledge that there is something decidedly wrong with our fields. We know that at one time they yielded much better crops but we willingly rest with the conclusion that they are 'wearing out.' Large areas of soils, even in this state, are acid and, as a consequence, will not yield as plentifully as they should. We have to determine by means of a very simple test whether or not our fields are acid and if so, apply a known and dependable remedy.

When a farmer finds that he cannot get a good stand of thrifty clover on his land, when he sees that certain weeds, such as corn spurry and sheep sorrel, grow readily in his fields, he could, by obtaining a small quantity of blue litmus paper at his drug store, easily test his own soil to find if it is acid. Soil acidity is responsible, in many instances, for the failure of seeding of alfalfa and clover. Growing in soils well supplied with lime, these plants are able to obtain the nitrogen essential for their growth through the work of certain kinds of bacteria or germs which penetrate the smaller roots, froming lumps or swellings, calfed nodules. Each of these nodules is a tiny chemical jaboratory, in which nitrogen gas is built up into compounds for use by the plant."

DON'T SLAUGHTER YOUNG EWES.

A recent issue of the Casket, Antigonish, says:—

"Large shipments of sheep are being made almost daily from Antigonish. So far this month we learn that 1500 have been shipped from here to Boston and Toronto markets. Prices are good. We hope our farmers will not seriously reduce their flocks to the injury of the sheep industry in the country. It is generally understood that the sheep industry will continue profitable, and our farmers should therefore maintain good flocks."

At the time of writing, October 21st., there are upwards of 3000 sheep in the hands of Sussex butchers, awaiting slaughter and subsequent shipment to Western markets. In the various flocks we notice some splendid young grade ewes which it is a pity to kill. The demand for mutton and lamb is, however, greater than the supply and some farmers will persist in selling off some valuable females despite the fact that if these females were kept for another year the proceeds from wool and lamb crops would increase their present value by one hdndred per cent.

A recent issue of the Live Stock World says:—

"Just for the moment mutton looks plentiful, but heavy receipts of sheep and lambs during the past few months portend a mutton shortage fully as acute as that of beef. Packers are slaughtering ewe lambs by the million, just as they beefed cows, heifers and calves during the period of the range cattle business was in the throes of liquidation. Nobody worried about beef shortage then, and impending mutton scarcity does not cause concern now. Free wool has merely accelerated the liquidation process, as with cost of production constantly increasing and revenues being cut down, growers have no alternative but get out of the business. Some of these days the Western supply of live muttons will have its tail clipped off close behind the ears. Growers are reducing their holdings 50 per cent and substituting cattle, as the expense is less, and all over Montana and Wyoming the sheep are being forced out. Heretofore the sheep grower has furnished the settler with a good markct for his hay, but that outlct will be closed and such bulky crops as hay and grain produced in the mountain region will have little value, as freight rates to Eastern markets are prohibitive."

THAT FIELD NEXT THE ROAD.

As we travel through farming districts we cannot help noticing the vast difference in the general air of tidyness that seems to prevail on the respective farms. On the one hand, we noticc farms where everything about the place spells thrift and tidyness. There are no old eyesores to mar the landscape, the buildings are in good repair, are neatly painted. The fences are in good repair and the gates are not sagging on their hinges. The fields and the livestock thereon are a pleasure to look at and the complete picture is one that the traveller will not soon forget. On the other hand, we find neglected buildings, fences, gates, and fields in which the owners do not seem to place any particular pride, and the live stock is of very nondescript breeding and unkempt. Stone heaps, old stumps, decayed trees or some other unsightly objects allowed to remain in the fields and around them the farmer has to make many eytra turns and loose a lot of time year after year when a few minutes' work with team would lor all time rid the field of the unsightly object.

It is a good idea for farmers to put their fields that lie next the road in as good tilth as possible and have them cleared of all unsightly obstructions. Fields of this kind leave a very favorable impression in the minds of the travelling public, and good impressions are valuable assets.

The following from the columns of the Breeders' Gazette anet this subject is well worthy of the careful consideration of our readers:

"A little missionary work can be done on that field that lies next the road. There the farmer can do things as they ought to be done, can have the drainage right, can apply limestone and phosphorus, manure and any other soil ameliorants needed. He can cover that field with great corn or overspread it with clover or make alfalfa grow there, as alfalfa ought to grow—thick, tall, rank, subduing all competitors. When passersby see that field will they not regain courage and new faith and take home some of the lessons. Is it not a man's duty to make the field as nearly perfect as he can make it, just for its effect upon his part of the world.

"If good animals are put in that field next the road, satisfying to all who see them, has not the owner rendered real service to his neighborhood? A few fine marcs with their foals, a few cows of good lineage, a little flock of ewes, perhaps, all these inspire and create emulation in those who passby."

IS LIME A FERTILIZER?

There is in the minds of a great many people a hazy idea that anything which is purchased for the purpose of applying to the soil should be classified as a fertilizer. Webster says: "fertilize" means "to enrich." But a distinction must be madc between apparent and real enrichment. The word, fertilizer, is used to include only those materials which contain one or more of the following kinds of plant food, viz.: nitrogen, phosphorus and potassium, or as they are more commonly called, ammonia, phosphoric acid and potash. The use of a fertilicer is justified when there is a deficiency in the soil of any of the above named plant foods. Lime, on the other hand, does not contain any of these elements or compounds, and, therefore, does not come in the fertilizer class. The use of lime will not of itself increase the amount of plant food which the soil contains. It must be used for other reasons.

When a soil contains arelatively large amount of iron and aluminum and a relatively small amount of lime it usually happens that the phosphoric acid of the soil is locked up or held in combination with the first named elements, which is an undesirable condition. Liming the soil tends to cause the iron and aluminum to give up the phosphoric acid, which is then taken over by the lime. Combined with lime the phosphoric acid is in a better form for the nourishment of the plant. Thus it may be secn that although lime contains no phosphoric acid, its application may give very much the same results as would be secured by a light application of a fertilizer which does contain it.

The potash of the soil is made more available in a similar manner. Nature has been wise in locking up the potash in rather unavailable forms; otherwise, many men would not hesitate to use it rapidly and thus actually deplete the fertility of their farms. These forms of potash are so unavailable that in some cases where it is known that the soil contains a large amount, the appearance of the growing crop indicates the need of this plant food. When lime is placed in the soil and comes in contact with the compounds of potash, a change takes place which in chemistry is called a substitution. In other words the lime takes the place of the potash in compound, thus leaving it in unavailable form for the plant roots to assimilate. From this it may also be seen that as this action takes place some of the results obtained by applying a fertilizer containing potash will be secured by the practice of liming.

(Continued on page 68.)

HORTICULTURE.

Small Fruits a Neglected Line on Most of our Farms.

In these northern, shorter climates, where small fruits need more attention, too, few of us raise fresh berries enough for table use or preserves for winter, and many an apple orchard goes to wreck for lack of care. With foresight and some time and toil, this condition might be improved and the overplus cashed at a comfortable profit. Old fruit trees, pruned, sprayed and grafted, will yield unsuspected returns, especially if cultivated close to the roots every few years. Grape vines, once established, aspire to heights beyond the reach of rabbits, and if planted around the buildings will not be disturbed very much by squirrels and birds. In the plum orchard, treelets spring up every year to replace the failing parent stock. A rhubarb patch located by the sinkspout or barnyard, where the soil is uncommonly rich, will spread to immense dimensions, and be all the more productive if divided and transplanted every fifth year where roots will not become grass-bound. Gooseberries and currants need spraying, but if looked after a little at first, bear flattering crops, and the marketing of these products is as much a trade as their culture. It were folly for the orchardist to work up apples and such like outputs for shelf goods, but the rarer articles, like peaches, plums, pears, currants, may be canned at home and put on sale anywhere. Whoever has partaken of the concoctions ordinarily offered as canned merchandise under the title of "tinned sauce," will readily imagine the reception tendered real conserve in glass.

Prepare the ground in the fall, a wood-encircled plot to safeguard against blossom-blighting frosts, a level field not so low as to hold water and ice the winter through, but, free of witch grass. If near a brook, to facilitate watering in dry times, all the better. Loam is the land for strawberries, and they will respond to generous dressing of barnyard compost, applied in the spring, at time of setting out the plants. For the first bed, speak ahead for your neighboring strawberry grower to let you know when he thins out his plants, and you will come for those he throws away. After this initial planting, you will have extra plants of your own to make a new bed every succeeding spring. They should be set out before the blossom buds have begun to form, but if your planting should be delayed until they have started, cut them off with shears, to preserve the vitality for root formation. Sever all runners, for the same reason. For every plant, dig a hole, insert the roots fill with water, then press earth, first with hands, then with foot, firmly around stem, making the foundation compact. If possible, set out in the face of the rain. If not, do the work after sundown, and water again the next night. During drouths, water with dipper and pail, but never in the sunshine, which will bake the earth. Do it after sundown. Dig a hole near the roots, pour in water then scrape dry earth up around roots, entirely covering wet spot, which it will keep moist for some time thereafter.

When possible, pick strawberries on cloudy days, or when rain is imminent. Failing this, undertake it when sun is low. If picking is done in hot sunshine, the plants wilt and half-grown strawberries dry up. In fall, cover strawberry rows with brush, removing in spring after danger of hard freezes is over. Every spring set out a new strawberry patch, to replace the failing one. Plant in rows to admit horsehoe and cultivator, and keep as clean as the potato rows.

After the second season, it hardly pays to keep the patch clean. Rather pick what berries it yields and set out a fresh patch. The old one will grow up to grass, producing good hay.

Raspberries last longer, with less care, but are not as paying a crop, the berries being more perishable, calling for gathering on the dot, and marketing on the minute. The second fall and every fall thereafter cut out the old woody canes down and lay the new, this-year's canes down and mulching them under brush to guard against winter-killing.

Cranberries will bear a deal of neglect. After the first outlay of time and labor, little is demanded by them. Clear up the swamp, take off the sod, and set out the vines, stamping them well into the clay and muck. Sprinkle with beach sand or gravel, to keep down the weed and grass. Next year apply more sand, and every ensuing year, as it is impossible to hand-weed the plot. Frost is about the only enemy given the cranberry nature. Late frosts striking after the vines blossom, ruin the crop. A fringe of bushes or tall trees does much to intercept the fall of frosts, and a dam, whereby the swamp may be flooded with water, on the approach of abnormally cold nights, is a preventive. With a rake cranberry picking is a delight; even by hand it is accomplished with phenomenal swiftness.

A wild blueberry patch means money, burn over the old bushes, and any little plot will furnish your own table.

Assistance for Horticulturists in Eastern New Brunswick.

Previous to this past summer, the farmers in the vicinity of Moncton have had assistance in connection with fruit growing, only very casually.

Since spring, Mr. D. B. Flewelling, who was at that time appointed to the horticultural staff, has been working among the farmers around Moncton, with headquarters in Moncton.

In the early spring, Mr. Flewelling superintended the pruning and spraying of a demonstration orchard at St. Joseph College. The results in this orchard will be published later.

During the month of May, Mr. Flewelling looked after the planting of several orchards. One of 450 trees at Humphrey's Mills; another of 350 trees on the McLaughlin Road; two of about 200 trees each near Salisbury; another small one at the same place, and a small one of 70 trees at Port Elgin.

After the planting season was over, Mr. Flewelling endeavored to visit the farmers who had apple trees and who were anxious to raise good apples. On such visits the various problems connected with fruit growing were discussed and all the assistance possible was given to the farmers.

At times calls for assistance were received and numerous trips were made to various parts, but the work was all along the same line, viz., the giving of information regarding apple culture.

When fair time came around, Mr. Flewelling was called to Fredericton to assist in getting ready an exhibit of fruit for the Fredericton exhibition. This same exhibit was staged at Chatham by him. He also judged the fruit at Chatham. After this he assisted in packing some apples for export trade from along the St. John river.

His services were again called into requisition to judge the fruit at the Hillsboro and Albert fairs.

Mr. Flewelling is now back in Moncton and is always ready to welcome any correspondence in connection with fruit growing. He tells us that he will also be glad to visit any farmer who needs assistance with his trees if they will address him at P. O. Box 172, Moncton, N. B.

Breeding Garden Peas for Yield.

During the past few years our knowledge on the subject of plant breeding has greatly increased. This new knowledge is slowly finding application in practice in the material improvement of our farm and garden crops. Only a beginning has been made and the next few years should see much greater progress than has heretofore been made. To the average farmer or gardener the mention of plant breeding suggests at once a mixture of fraud and deceit, something to be avoided. It must be confessed that both these elements have entered into many of the productions of recent years, thus discrediting more or less the idea of breeding plants for improved races.

But the real genuine plant breeder is any man who each year selects his corn or cucumber seed for the next year's planting. He may be a good breeder or a poor one, according to the knowledge and intelligence he displays in making his selections, but he is a plant breeder just the same.

To the amateur who seeks pleasure and success in breeding, the garden pea offers an excellent opportunity, and the market gardener may, through the application of intelligently directed methods of selection, materially increase the yield and profits from peas. If one wishes to breed an improved race of peas the first thing to be decided is the sort of pea desired. Earliness is commonly an important point and high quality should not be neglected. Then the grower or the market, as the case may be, commonly has preferences as to the type of pod. Most varieties are fairly well fixed in these qualities and they may be considered as largely settled in the choice of the variety, or varieties, with which to make a start. In case one is not familiar with pea varieties a number may be grown and their merits and demerits compared. Once the variety is chosen the principal task of the breeder is to select for greater productiveness, not forgetting to maintain earliness and other desirable characters of the parent variety.

Everyone knows that individual plants vary greatly in productiveness one vine may bear only one or two pods and another a dozen or more, and yet both plants may be apparently alike in quality, season and character of pod and vine. We have found that there is a close relation between all parts of the vine. Within reasonable limits it is true that as the vine becomes longer the number of pods increases and contain a greater number of larger and better peas. The individual plant is a unit and its parts prosper or suffer together.

Let us consider for a moment the differences in productiveness of individual vines. We should remember that a large part of these differences are due to variation in soil, exposure or to other conditions of growth. The seed pea happened to fall where moisture and food conditions were just right, or it may have fallen where these requirements were unfavorable or lacking. Thus by chance is the yield of the plant very largely determined. Such differences do not appear to be inherited in any noticeable degree. They are the result of surrounding conditions and not of any quality of the plant itself.

HEREDITY AND ENVIRONMENT FACTORS.

But along with these environmental variations are many that are inherited though in an ordinary field of plants it is impossible to tell whether an especially prolific plant is so because of a fortunate situation or because of a hereditary tendency to produce heavily. Twenty pods on a vine that has been well nourished may, very likely, look just like 20 pods on a vine of a high-yielding strain. This is why they have not already been distinguished and the high-yielding strains separated from those of only mediocre yielding power. Much of the recent progress in breeding before alluded to is in devising methods of distinguishing plants that are high yielding, because of hereditary quaities, from those that are high yielding because of environmental conditions.

The method of distinguishing the nature of these differences is by testing the average yielding power of each plant itself. To do this the seeds from each plant must be saved separately and planted by itself. When this is done it will be found that many of the apparently superior plants are not able to transmit their character of high yield and are only medicore after all, but some should show superiority and such are to be continued under observation, while all distinctly inferior ones are rejected. This is the method that has given such excellent results with small grains in the northwestern states and in Europe, also with tobacco in the Connecticut valley. It should be successful with all crops that are naturally self-fertilized, such as peas, beans, tobacco and most of the field grains.

PLAN OF OPERATION.

In the actual carrying out of this idea one would make a liberal planting of the variety or varieties that best answer the general requirements of the grower. The field should be examined from time to time and any plants that seem especially vigorous and productive and at the same time are of the type desired, should be

BANK OF NOVA SCOTIA ESTABLISHED 1832

Safeguard Your Savings

Many a man has lost the hard-earned savings of a life-time through bad investments. You should safeguard yours. Since 1832 we have been serving the public as a depositary for their savings. Capital and Surplus $17,000,000. Total resources over $78,000,000. Our Annual Statements have been independently audited since 1906. 13

All trees guaranteed free from scale, true to name, and of first class stock.

"Home Grown Trees are the Best."

Fall orders should be in before end of October.

Prompt attention given. Prices on application.

SPRINGVALE FARM AYRSHIRES

We are now offering for sale three choice young Ayrshire bull calves out of dams that were first prize winners in the 1912 dairy test at the Maritime Winter Fair, Amherst, N. S. Inspection solicited. Write for full information if interested to

F. S. BLACK, Amherst, N. S.

marked in some way. When ripe the seed of each plant is saved by itself.

The next season this seed is carefully planted, giving each plant liberal space and still keeping each lot of seed distinct. The plants are closely watched during the growing season and those lots, not individual plants this time, which show superiority are chosen for the next year's sowing. One may ask here why it is not necessary to select individual plants as before. The answer is that, according to present indications, it would do no good. We have records of hundreds of cases where the progeny of such superior plants have gone back to the average of the race in the first generation. We must seek to separate high-yielding strains; there is little reason to believe that continued selection of individual plants with in the race will be accompanied by continued improvement.

It may require three or four years to conclusively demonstrate which of the several races under observation is the best in the long run. The leader of one year may be only fair under the different conditions that prevoil during the succeeding season, but when we get the average results of a period of years we have something that can be depended upon.— Prof. J. K. Shaw, Mass. Agricultural College.

Saved old Strawberry Bed.

After picking $150 worth of strawberries from my one-fourth acre in 1912, it was so overgrown with grass and weeds I decided to abandon it, but later concluded to try a new way and save it if possible. On August 7 I mowed it with machine, and with horserake took off all the vines, weeds and mulching, going over it reapeatedly until the rake would catch no more. Then with plow, the coulter first being ground to a sharp edge, I cut away the edges of strawberry rows, turning the furrows into the space between the rows.

Then with the spring-tooth harrow I harrowed the bed lengthwise and across it and repeated. The cross harrowing dragged earth onto the plants. When through harrowing but very few plants could be seen and most of the weeds were torn out or buried—likewise a great many strawberry plants; in fact, the treatment was too drastic for many plants were removed. A smoothing harrow would have done better work, as would be expected. Doing the work so late no new plants were set. The few runners sent out did not set plants of any value. If I had cleaned the bed as soon as I finished picking berries, July 20, many new plants would have formed.

I left three rows I did not clean out so the piece I renewed was about three-sixteenths acre. The total cost including weeding, cultivating and mulching, crates and berry boxes was $20. To our credit we had $72 for berries sold in 1913. This left $ 52 for the use of three-sixseenths acre of land one year.—In N. E. Homestead.

DAIRYING.

The Cream Gathering Creamery in Nova Scotia.

In response to the request of several interested readers we reproduce the following arsicle from the columns of The Maritime Merchant. We have on several occasions given the history of some of the creameries mentioned in the article in question. A good story, particularly a story of progressiveness in any line appertaining to the farming industry will bear repeating many times:—

The adaptability of Maritime Province farms to dairying is unquestioned. The success of those who have intelligently pursued the business in these provinces is equally established. Yet, the total production of milk and butter and cheese, while comparing favorably with that of the dairy production of Queber and Ontario.

Those who have carefully studied the agricultural situation of the East, state that no single line of agricultural husbandry will do so much to build up fertile farms and to establish the financial side of farming as dairying, and claim that the lack of development of this industry in these provinces is, more than anything else, responsible for the present backward condition of farming.

In view of these considerations, we look with much pleasure to a dairy movement that is taking hold of the Maritime Provinces, and which in this article we deal with as it has developed in the southernmost province of the three—Nova Scotia.

We have not to go back many years to trace the history of the 'cream gathering' creamery movement in Nova Scotia. It centers around Scotsburn, Pictou Co., the largest and most successful creamery in Nova Scotia. This creamery was established some 12 years ago by the Dominion Government on what is known as the 'whole milk' basis, i. e., a power separator was installed in the factory and the farmers all brought their fresh milk to the factory, where it was separated and the skim milk returned. Under this system, the Scotsburn management had to meet a considerable deficit annually, and at no time, manufactured more than 32,000 lbs. of butter in any one year. The matter of closing the creamery was seriously considered, but, fortunately, it was determined some five years ago to change from the 'whole milk' system to the cream' system.

Under the 'cream gathering' system each has his own separator and separates his cream at home. He keeps it cool in clean vessels and delivers it to the creamery three times per week in summer and twice per week in winter. Not only does he haul a less bulky product but he saves three or more trips per week. He does not have to deliver this cream at an early hour in the morning, and, if he co-operates with his neighbor, he can still further economize labor by drawing all the cream from a community one trip, his neighbor doing the same the next trip and so on until he himself does not have to make more than twelve or twenty trips to the creamery all year. Moreover, under this system, the farmer can feed his fresh warm milk to the calves and pigs and get much better returns from it than from the same amount of skim milk which has been hauled to the creamery and brought back to the farm again.

But the outstanding advantage of this system consists in the fact that it makes it possible for a creamery to operate over a large territory and so secure sufficient cream to do a large business and consequently a more profitable business. It may come as a surprise to those to whom the name is very familiar to learn that on this basis T. Eaton & Co. conduct a creamery in their Toronto store, cream for which is brought as far as 300 miles from Toronto. Scotsburn, in the same way manufactures cream secured from an area of country extending as far west as Wallace, and as far East as Pictou, and will this year manufacture nearly 200,000 lbs. of butter in comparison with 16,000lbs. manufactured eight or nine years ago.

Away west in Yarmouth Co. two young fellows, Fred Porter and Don Chipman, both of whom spent two or three years at the Agricultural College, made up their minds that what could be accomplished in Pictou could also be accomplished in Yarmouth. Despite the fact that some twelve years previously, a creamery established in that county had failed, causing many farmers to be skeptical about the project, these boys had faith enough to organize a company and construct a creamery. The very first year, 1912, they manufactured nearly 75,000 lbs. of butter, and this year's output bids fair to nearly double that amount. Yarmouth is already a success.

In River Herbert, Cumberland Co., Roland Rutherford, Geo. Christie, Bert Landels, all graduates of the N. S. Agricultural College, and others, equally energetic, established a cream gathering creamery about 18 months ago. Their operations have been somewhat hampered by the large local demand for whole milk at Amherst, the Joggins, etc., and by the system of hay selling which prevails to a large extent in this part of the country. Nevertheless, they are gradually establishing a sound business proposition and will this year manufacture 50,000 or more pounds of butter.

The Municipality of Clare in Digby Co., peopled mostly by French Acadians, who have com) to recognize that they must to an increasing extent, look to the farm rather than to the precarious sea or the exhausted forests for a sure living have also fallen in line. Down at Meteghan a 'cream gathering' creamery has this year got away to a good start and in Meteghan River a 'whole milk' creamery promises to give a good account of itself in that thickly settled country.

All the creameries thus far referred to, are within easy access of the railroad and receive cream delivered by the railroads. In June however, the farmers of South River, Lochaber and adjoining communities in Antigonish and Guysboro Counties opened on Lake Katrine, the finest creamery yet built in Nova Scotia. Two clergymen, Rev. Dr. McPherson of the Roman Catholic Church, and Rev. A. McLeod of the Presbyterian Church were prime movers. Several other prominent names should be mentioned in connection with this creamery but we refer to these in order to show the interest which the [illegible] is taking in the material welfare of the farmer. The creamery is some twenty miles back from the railroad but it is to be served by an extensive area in which are some of the finest farming lands in Nova Scotia. The 'cream gathering' system enables it to operate over a large territory and it is bound to prove a success and accomplish a great deal of good for the farmers in that part of the country.

Nor has the movement ceased for down in Lunenburg Co. plans are being made for a large creamery that will tap the whole country served by the H. & S. W. Ry. In Stellarton, Pictou Co. a company with provisional directors has been organized to carry on the same business throughout the country as far as Antigonish on the I. C. R., and as far west, if need be, as Truro. In Baddeck, C. B., preliminary steps have been taken to establish a creamery to serve nearly the whole country bordering on Little Bras d'Or including not only the mainland sections but also the Island of Boulardarie. Inverness is also getting ready to fall in line and the matter is also being considered in several other important parts of the province. The establishment of these creameries means that the country merchant, who has heretofore

One Sharples Milker Does the Work of Three Men

SHARPLES MILKER

Represents all that is best and permanent in mechanical milking

Think of the importance—the great advantage—the economic value—and what it would mean to you in the saving of time, trouble, labor and money if you installed a Sharples Milker in your dairy—today.

It would mean that with the Milker one man could do the work of three. It would eliminate the tedious, disagreeable, slow hand milking—known as dairying drudgery. It would mean a better and more contented class of employees. It would mean that you would be able to accomplish the conditions that would *save time, trouble, labor and money.*

Still more—you would be assured a purer and more marketable product, low in bacterial count, as all stable air is entirely excluded and all milking parts are easily and quickly cleaned.

Cows take to the Sharples Milker and stand quietly and more contentedly than when milked by hand, for it always milks a cow in exactly the same way every time. It is regular and gentle. It fosters milk production by keeping the cows in better condition. The Sharples has the "teat cup with the upward squeeze."

The fact that more than fifty thousand cows are being successfully milked today by the Sharples Milker, should alone convince you that it would be to your interest to investigate.

done business in buying and shipping butter will lose a large part of his trade, and the first blush, it might seem that he suffer. We have discussed the question with many of these men and have learned from them that the butter trade is one of the most unsatisfactory parts of their business. If they could handle only the good butter that is made in a community, the business would be alright, but, unfortunately for them, they have to handle all kinds of butter, the good and bad a like, and if they would hold their custom, they dare not discriminate to any great extent between the two grades and they are losers. In the end they will be better off if the farmers, through well managed creameries were getting more cash with which they would undoubtedly buy more commodities than heretofore.

Another organization that is greatly interested in this creamery development is the rural church. Those who persue church periodicals cannot but be struck with the apprehension with which the clergy are viewing the falling away of many of the rural churches. A recent conference upon this point held by the Pictou Presbytery of the Presbyterian Church revealed the fact the one outstanding rural community in which the church has made progress as evidenced by increased membership and increase giving to the various schemes of the church was Scotsburn. And it had to be admitted that, of all those agencies which were moving for the prosperity of the church, the farmers creamery was not the least important. The facts are that the church, the business community and everyone interested in the welfare of the province of Nova Scotia must recognize that this creamery movement is one of several other movements that are gradually adding to the prosperity of the farmer and the whole province of Nova Scotia.

In a movement of this kind it is usually safe to assume that there is some one person who is in a large measure responsible for the results achieved. The present is no exception. The leading spirit in this case is W. A. McKay, Dairy Superintendant for the province of Nova Scotia. Mr. McKay is an Ontario man but coming to Nova Scotia some five years ago took hold of the Scotsburn Creamery and developed it from a corporation that had to meet a deficit every year to one that soon paid a splendid profit.

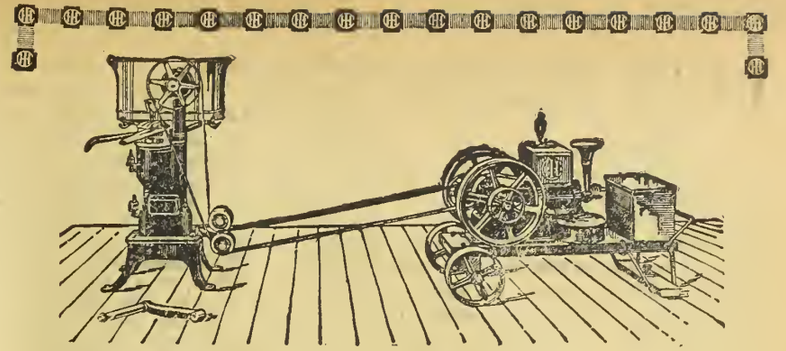
Hard and Soft Butter.

Just as softness in butter is a summer trouble, so is hardness a trouble in the winter, but both can be obviated by careful management in the feeding and the process of manufacture. The dry food supplied to cattle is known to exert a marked influence upon the texture of butter when it includes linseed or cotton cake. Although the quantity of oil in linseed cake is no larger than in cotton cake of the best quality, it produces a different result. A liberal allowance of linseed cake to a cow will be followed by an improvement in the appearance of her coat, giving it a glossiness which is new to it, and it will soften the butter. On the other hand, the employment of cotton cake will increase the firmness of the butter, and for this reason it is frequently employed for the cows during the summer season, when, owing to the temperature of the air, butter is liable to become too soft for manipulation.

It is not desirable, however, to employ linseed cake in winter for the purpose of obtaining the opposite result, for it is not a good food for butter production. If the butter is too firm where cotton cake is supplied, it may be removed from the ration, and a little maize meal supplied instead, the ratio of albuminoids to carbohydrates being maintained in some other way, although as a matter of experience the provision of any specified quantity of albuminoids is less necessary than is usually supposed. The change, however, is chiefly effected in the dairy. When the temperature is low, the cream is apt to get too cool. The churn is of necessity cold, and the water used is colder, all being employed in the very cold atmosphere of the dairy. Obviously, the tempature must be raised; and here let it be remarked that one of the great secrets of successful dairying is control of tempature. Without it the production of cheese is impossible. Milk is spoiled with great rapidity when exposed to high tempature, while where it is exposed to low temperature the cream fails to rise normally.

Successful buttermaking demands a certain amount of control over the tempature. Thus, the cream should be raised on a very cold winter day to from 61 to 63 deg. F., in accordance with the degree of tempature. The churn should be warmed with hot water to the same degree, and in order to prevent the tempature of both cream and churn from falling the dairy should be warmed in the same way. If this is done the tempature of the water employed in washing will not be of such great moment. It may be used at from 45 degrees to 50 degrees. If warm cream is poured into a cold churn the temperature will fall, the butter will be long in coming, and it will be possibly be too firm for the purpose intended, and this is all the more liable to occur when the dairy is cold.

Conditions being normal, therefore, the cream is churned, the butter brought in grains about the size of fine rice and washed with water of a temperature of about 50 deg., until it leaves the churn perfectly clear. It is then brined at the same tempature, and removed in the grain from the churn on to a wooden trough for draining. Here it should become fairly crisp, and when dry enough, in the judgment of the maker, it may be removed on to the butter worker, carefully prepared first with hot water and then with cooled water, and made up. The temperature of the dairy will prevent the hardening which is so desirable in the summer season, when it is then usually obtained by careful makers by the aid of a hardening box.—James Long.



This Outfit Was Made for You

THERE was a time when all farmers hitched up every other morning—part of the year every morning—and took their milk to the creamery. Today many of them use cream separators, because they find more advantages fewer difficulties, and much profit in the modern way.

Do you still plod the uncertain creamery route, or have you the efficient little team shown above at work for you? This outfit, an

I H C Cream Separator
Dairymaid, Bluebell, or Lily

and a one-horse power back-geared I H C engine, will save you, in cream, from five to fifteen dollars per year on every cow milked, separate your milk and cream cleanly and thoroughly, and give you clean, fresh, warm skim milk to feed that will build up fat, healthy pigs and calves. I H C separators are the best separator bargains you can buy, because they will do better work and last longer than others.

Then the engine half of the team is always ready to pump water for you, run the grindstone, washing machine, sausage grinder, churn, and other machines. It is economical, sturdy, steady and reliable.

The I H C local agent will show you the outfits. Write for catalogues and full information to the

Choose Good Stanchions

What's YOUR idea of a GOOD Stanchion?

Isn't it one that will never bulge or sag, one that will last you a lifetime, one that will lock and unlock as easily a year from now or ten years from now as on the day you bought it—and one that holds the cattle surely?

The O. K. Canadian Stanchion comes up to all these requirements—because we've been making Stanchions so long that we're on to every wrinkle in the business and we know just how to make every part best and what to make it of.

Frames of the best U-bar or channel-section steel—so strong and rigid that they simply can't bulge or bend.

Swing bars hinged high instead of at the bottom—so they will always be easy to lock and unlock—and fixed so that they cannot fall to the floor when open, to be tread on and bent.

A lock that's so simple that it can't get out of order in years of use, easy to work, and proof against the "slickest" cow.

The arched post design of O. K. Canadian Stalls prevents the cattle's walking through into the feed trough or pulling feed back into the stall and still leaves plenty of room at the top for operating the Stanchion, without sacrificing strength or increasing the cost. Our patented clamp makes the work of setting up "O.K Canadian" equipments simpler and quicker than any other.

We have a couple of booklets that are chock-full of interesting points for dairymen and they'll show you how to figure just what an "O.K Canadian" equipment will cost for Your barn whether you want just the Stanchions or whether you want to put in complete metal stalls. They're yours if you'll ask for them. Department C

Hoven in Cattle.

Distension of the rumen or paunch with the accumulation of gases is one of the most common diseases that the digestive organs of the ox tribe are subject to. It is known in various parts of the country by different names, the most common being hoven or blown, fog, or dew-sickness. Tympanitis is very appropriate, on account of the drum-like sound produced when the side of the animal is struck with the fingers. In sheep the disease ocassionally manifests itself with as much severity as in cattle but the former are comparatively extemp, for the reason that pasturage at all times constitutes a large pro portion of their diet, and is partaken of more slowly, while they themselves are kept under more natural conditions, not subjected to such sudden changes of feeding as cattle. There are two forms of tympanitis: acute hoven, as generally seen in cattle turned out to grass, in which the evolution of gas is from green food impacted in the paunch in a state of active fermentation; and the chronic form, which appears intermittenly in stall-fed cows and fattening oxen, and is associated with a want of tone, functional derangement, or the presence of foreign bodies in the organ particularly involved. Suckling animals, both calves abd lambs, are very liable to attacks of hoven, as, owing to the comparatively small size of the rumen, anything interfering with the proper assimilation of the food causes a temporary suspenpension of its functions, and fermentation at once setting in brings about subsequent distension of that organ with gaseous material.

CAUSES.

Cattle that have been lying in a yard and feeding mainly on dry food during the winter are, upon being turned out to grass in the spring, very prone to attacks of tympanitis—particularly so if the pastures be fresh and luxuriant. At that time of the year the disease is more general than at any other. In the autumn, putting them on green fields while the dew is still heavy or the mornings are foggy, is another frequent cause. Excessively watery pasturage will likewise produce it. During the summer many cases originate from cattle eating the aftermath of clover or young eddishes directly after a shower, or when it is damp; and these cases are generally the most acute and severe. Turnips, potato or mangel tops, cabbage leaves, and various other green foods, which oxen will devour greedily, are liable to produce this ailment. Dairy cows feeding on malt-culms, or steeped barley, will frequently have an attack, or if they eat cut green food that is either too fresh or not sufficiently mixed with drier constituents. Some amount of tympanitis is nearly always associated with some other diseases of the rumen, impaction of the third stomach, choking, constipation of the bowels, "milk fever", or any disorder of the system in which the bodily functions are apt to be suspended.

SYMPTOMS.

While the animal is feeding, or soon after it has left off, lain down and begun to chew its cud, a swelling appears on the left side near the flank. This increases in size, and with the enlarging there is panting, dullness, and a labored breathing. Rumination is stopped, but in the earlier stages the animal evacuates a little gas. The swelling becomes visibly larger, and with the increase the breathing becomes more difficult. The head is stretched out, the nostrils are expanded, saliva dribbles from the mouth, a low moan is frequently heard, and the animal stands with a stiffly arched back. On tapping the enlargement with the fingers a drum-like sound is emitted, the skin over the part seeming stretched to its fullest extent. Much uneasiness is now manifested, either by a shifting of the legs, first one and then the other, or a kicking at the belly. These symptoms become more aggravated, the eyes get bloodshot and prominent the distension is excessive the breathing badly oppressed, and unless something be speedily done to relieve its sufferings the animal staggers about a little, then falls to the ground, struggles violently, and either dies from suffocation or from the absorption of the gases into the circulation. In acute cases the duration of the malady is very short, and frequently in less than an hour from the time it is first attacked, the animal lies dead upon the ground, with a green frothy matter exuding from its nostrils, and its body distended to an enormous degree.

TREATMENT.

In all cases the first aim is to bring about a condensation and get rid of the gases causing the trouble. Directly the distension is noticed, give the animal two ounces of aromatic spirits of ammonia, in a pint of cold water. Should the distension go on increasing, and the patient appear unrelieved, the same should be repeated in the course of half-an-hour. Following this, a bold purgative is necessary to clear the fermenting mass from the stomach; a pound to a pound and a half of Epsom salts with a little ground ginger given in the usual way is best. But, notwithstanding that this tends to accelerate relief, it should never be given until after the stimulants have been employed once or twice, as the patient might die before its effects were noticeable. From the slowness of their action, neither linseed oil nor turpentine is admissible here. Walking the patient gently about will assist the action of the medicines, restore the suspended function to the rumen, and thus help to get rid of the gaseous material.

PUNCTURING.

In those cases where the distension becomes excessive, the breathing much interfered with, and suffocation threatens, mechanical means for relief must be had recourse to. The paunch at its most distended part should be punctured—with a penknife when no other agency is forthcoming—and an improvised tube made of elder wood inserted; but the more scientific trocar and cannula should be in the possession of every cattle owner. This has often been described. It consists of a puncturing instrument enclosed in a sheath; the latter is left in the side when the stilletto is withdrawn, and the gas easily escapes through it. Either of these agencies will give immediate relief, the gases at once rushing out, whilst a sour, foetid odor comes from the rumen. The tube may be left in for some little time, until the swelling has become reduced and the parts assumed their natural size. In the case of one of elderwood, however, provision must be taken against its slipping through into the stomach. When the tube is withdrawn the wound will heal up with a little ordinary attention. In some places passing the probang is the custom in cases of this kind, but puncturing is more beneficial for giving instantaneous relief.

In many country districts farmers will pour a quantity of cold water over the loins of the animal directly it is observed to be suffering from having blown itself. This is really an excellent plan, causing a reaction of the stomach, a stimulating of its functions of rumination, with evacuation of gases both through the gullet and bowels. It must not, however, be depended on in the severer cases. Food should be withheld from any patient until the attack is over and the bowels and stomach are at work again. For the next few days a low diet will be required, and an avoidance of the cause is at all times absolutely necessary. As regards the use of hyposulphite of soda in this disease, though recommended by some authorities, its benefits will be more noticeable in the less severe cases — those of a chronuc, intermittent character specially associated with indigestion. In the acute form— leaving alone mechanical agencies as a final resource—no better medicines can be employed than the ammoniacal preparations as recommended, which may be used pretty frequently.

CHRONIC TYMPANITIS.

This is a form of hoven usually seen in dairy cows and stall-fed cattle. It occurs at intervals and the distension of the rumen, though never so excessive as to be absolutely dangerous, is apt to produce a great deal of discomfort. The main cause is often indigestion, but a very small quantity of green food or fresh pulped mangels will produce it; other causes are a want of tone in the walls of the rumen, which cannot contract properly on its contents; and the presence of foreign bodies or extraneous matter in its interior. When these cases recur at intervals a careful system of dieting is necessary, and the food should always be easily digestible. For the distension, a good dose of Epsom salts, with a little carbonate of ammonia, will generally be sufficient to remove the cause and bring about relief; whilst a course of such medicine as an ounce of hyosulphite of soda, given with half the quantity of powdered ginger and gentian once a day in beer or gruel to a full-sized ox, to keep up the tone ofthe stomachs, will be attended with much benefit.—F. and H. A Woman Who Keeps Sheep.

There recently came to the attention of the editor of the Maine Farmer an instance of successful sheep-raising on a Maine farm as a side line for the farmer's wife, and it seemed to me a mighty good thing for a good many people to know. I learned of this little enterprise when Mrs. Addie M. Stone, of West Paris, wrote to W. B. Kendall, the owner of Long Branch farm in Bowdoinham, making inquiry in regard to the purchase of a pure-bred ram for the purpose of breeding up her flock of grade sheep and discovering that Mrs. Stone was apparently very much interested in the sheep business and very enthusiastic withal, I started out to learn some more about this flock and its owner.

Mrs. Stone was kind enough to tell her story frankly, and so I learned that ten or eleven years ago she received a gift of a lamb, which she raised by hand. It was a fine ewe of unknown breeding, and she asked her husband if she might start a flock of sheep. She says that he smilingly replied in the affirmative, and from the beginning she has kept the ewes until now she has a handsome flock of twenty-one sheep and eighteen fine lambs.

The farm on which the sheep are kept is a good upland farm of 240 acres, with a good pasture for sheep. Mrs. Stone has grades from different breeds, but has not made up her mind to start out for a pure-bred flock with either Leicester or Hampshire blood, as thoses predominate in her herd; to do this she plans to begin in the logical way by buying a pure-bred ram and then two or three ewes of the same breed.

In beginning her flock of sheep, Mrs. Stone's ewe gave birth to twins the second year after she came to the farm. She sold the buck at twelve weeks for $6. Since that time the male and female lambs have been about equal.

Mrs. Stone has had a good home market, for Paris Hill is a high-class summer resort. Her lambs go to the local dealers and are sold at a price per head, to be taken during the season, before Sept. 1.

The sheep have a good pasture in the summer, and in the winter they are fed with the same hay that the other stock on the farm receive, some oats cut for fodder, and a few apples and potatoes cut once a day. They are salted every week, have good clean water, and are kept in a roomy pen and turned out in good weather.

This year, Mrs. Stone sold the wool for 20 cents a pound, and the clip averaged 7½ pounds. The eighteen lambs brought $4.75 a head. Last year, Mrs. Stone won second prize at the Oxford County Fair with a flock of twelve grades.

Mrs. Stone believes that a woman should have something of her own on the farm if she so desires, that will bring in some money and give her a special interest in the farm. She says that sheep are easier to care for than hens, and not half as dirty. Having won second prize with a flock of grades, she is now

anxious for a flock of pure-bred sheep which can win first prize, and she is apparently the kind that is likely to win out.—Maine Farmer.

Profitable Sheep Raising.

The building up and maintenance of better flocks upon Maritime Province farms means more profit, richer and more productive soil, cleaner tillage of the land; in fact, greater profit in general from the farm. The Maritime farmer of the future must be a better flock master; he must possess a fuller and deeper conception of the art of profitable sheep keeping; he must give more careful thought to the development of every detail of sheep husbandry; in full, he must develop in himself a disposition to maintain flocks of higher productive quality. Our flock standard today is far from what it should be; in other words, materially below what the Maritime Province farm is capable of maintaining. The great stride on the part of the Maritime farmer to accumulate acres for grazing purposes has lead to the development of but one side of profitable sheep husbandry, and do we not in particular see vivid evidence of this condition in the general average of our flocks. Our country possesses the richest soil producing pasture areas in the world. Our opportunities for the maintenance of profitable flocks are unparallel. Our one and practically only great need is the right kind of management to take up and operate more intensive sheep husbandry.

The most effectual and permanent improvements in the flock must have its foundation in the blood. Nature has so incorporated her laws of improvement both in the animal and vegetable kingdom that the building up process must have its source in the introduction of new blood from unrelated ancestors. Cross-breeding is not the most effectual method of establishing improvements in the flock, but rather a temporary means of side-tracking the desired end to be attained. In endeavoring to improve the flock some well-defined purpose to be accomplished must first be developed before the introduction of new blood can be made effectual. The larger number of flock masters in attempting to improve their flocks possess no definite purpose in their breeding operation, consequently fail to accomplish immediate results from their effort. There is little or no use attempting to improve a flock through either selection or introduction of new blood until some well formulated and defined purpose has been worked out, so that the foundation of the whole work may be properly laid and effectually built upon. Any desirable and permanent improvement is founded upon well developed laws, and the nearer we can strive to bring into working harmony their influences the more readily will be the returns.

There are eventually two means open to the flockmaster through which he can immediately and permanently effect improvement. First, through the selection of desirable ewes to lay the foundation, and second, through the introduction of new blood in males. In the start the first step is the most important, and too much attention cannot be spared in giving this part careful study. A great many flockmasters make a big error in looking too strongly to the male factor of the flock to effect the greatest improvements. The male contributes half and no more. If any quality is to be permanently fixed so that it will be transmitted to the progeny, that quality must be possessed in both male and female to the same marked extent. In making selection of ewes, then, too much attention cannot be paid to selecting such animals that possess to a marked degree the qualities desired to be perpetuated. For instance, if the flock is to be maintained born for the production of wool and mutton, these qualities must be as evident in the females as in the male. The progeny from crossing strong males onto females of weaker quality can only influence temporary improvements, and in many instances not be marked extent. So in the gradual building up of the flock give no less attention to selecting females of strong characteristics than in the males, as one is as influential in the fixation of desirable qualities as the other.

The foundation of permanent improvements in the flock should be laid in the selection of good breeding stock. The flockmaster who has at his command a good flock of breeding ewes is in the best position to lay the right kind of a foundation. In making his selections he should keep vividly in mind the purpose already developed. Select ewes for breeding that approach nearest your ideal and discard those possessing weaker characteristics. The ewes should possess to a marked degree feminine qualities that are desirable to be permanently fixed in the flock, but no attempt should be made to infuse masculine qualities only through the male, as best results cannot be effected through such a method of improvement. Many flockmasters overlook this fact in making selections, consequently debar rapid improvement.

The care the flock receives during the breeding season has a marked and lasting influence upon improvement. The ewes should be gotten into condition early, so that they may safely copulate at the first service of the male. As soon as the ewes have recuperated after weaning the lambs they should be put on good pasture and "flushed" forward as rapidly as possible. A light grain ration is an excellent stimulant to strengthen the system and build up strong, healthy bodies. Do not attempt improvement without first giving the flock the best of care during the period of copulation, as success depends largely upon the male at this time. In the management of the flock during the fall too the condition of both male and female much stress cannot be placed upon close attention to details, as they are most instrumental in governing results.

REPEATING RIFLES Pump Action

Solid Breech Hammerless-Safe

THOUSANDS of sportsmen have first chosen a Remington for its looks—its balance—its speed suggestion—and have been delighted to find that they had an arm that was a little faster—a little more accurate than any rifle they ever owned.

.22 Repeating Rifles—easy take-down—straight line feed. .25, .30, .32 Remington high power rifles.

An interesting booklet simply explaining many of the more technical points of modern rifle construction is yours for the asking. Your name and address on a postcard brings it by return mail. 4

Eddy's Matches

The Choice of Generations.

Sixty-two years ago your Grandmother kindled the fire with the "Eight-day" sulphur—the first EDDY product. To day most of the nine million Canadians favor the new silent "Ses-qui" non-poisonous matches, or one of the many other brands made by EDDY. Ask your dealer.

Sheep Notes.

Sheep will live and do better with the same care than any other animal on the farm.

Sheep to be the most profitable must be well cared for all the time. variety of plants than the horse or ox.

Sheep cannot be multiplied nearly so fast as hogs, but they represent a more varied market.

The most sought for breeds of sheep are those combining mutton and wool productions in the highest degree.

All young stock will thrive well and develop faster without being compelled to carry a load of fat.

Early maturity is just as advantageous to the producer of sheep as to any other stock in the world.

THE HORSE.

Blistering.

How often, when asking a friend to look at a lame horse or seeking advice through a paper, the reply is "blister," and there it ends, giving the owner no instructions of what preparations are necessary before doing it, what blister to use, now to use it, and how long rest is required, leaving the owner to find out all the various details connected with the operation, which, though apparently simple, requires, if the best results are to be obtained, a certain amount of technical knowledge not always possessed by the beginner, and through improper blisters and want of knowledge many horses are badly disfigured and blemished for life.

WHEN USED.

In all cases of sprained tendons or ligaments, after the heat and tenderness have been reduced by the application of cooling lotions containing acetate of lead, also in bony enlargements such as splints, ringbones and spavins. A blister is occasionally used on the abcess to hasten its development, and in strangles the throat is sometimes blistered. Capped knees and hocks may be blistered to reduce the swelling. Before blistering, have the horse in the stable for afew days, giving either a condition powder or a dose of Epsom salts in a bran mash daily, half feeds or corn, and a fair quantity of long hay. See that there is a stall where the horse can be conveniently kept on the pillar reins for awhile, being careful to choose a stall out of a draught, as during the time the animal is very susceptibble to cold owing to nervous depression and want of exercise. Never blister more than two legs at once, either two fore, two hind, or cross blister legs near fore and off hind, or vice versa, as it is cruel to blister all four legs at once. Have the hair clipped off the legs, leaving it behind the knee and in the heels, so as to protect the parts from the blister.

THE BLISTER TO USE.

These are either made of cantharides (Spanish fly), or the red biniode of mercury. The Spanish fly or, more properly speaking, beetle is about one inch in length, of shining metallic colour, and is caught and sent into the market from Hungary in a dried condition. A good fly blister is made of 1 oz. of Spanish olive oil. Infuse the flies in the oil, in a covereh vessel, for twelve hours, then place the vessel in boiling water for fifteen minutes, strain through muslin with strong pressure, add the product to the wax previously melted, and stir constantly while the mixture cools. This can be obtained from the chemist under the name of cantharides ointment, of the British Pharmacopoeia of 1885, and is always the same strength and quality, no matter where bought. The red iodide of mercury in fine powder into 1 oz. of benzoated lard or unsalted lard. Then there is a liquid blister, which may be used for sweating a joint or for applying to the throat in cases of influenza or strangles. Take 5 oz. of Spanish fly and mix with three fluid ounces of acetic ether, pack in a percolator, and at the expiration of twenty-four hours pour acetic ether over the contents of the percolator and allow the solution to pass slowly through until 20 oz. are obtained. This is known to the chemist as blistering fluid, and should be kept in a stoppered bottle.

Often both the red and the fly blister are used on the same leg if there are bony excrescenes as well as strained tendons. The general rule is to app,8 fly blister for tendinous troubles and red for bony trouble, such as ringbones, splints, etc. The front legs require about 2 oz. per leg, the hind 3 to 4 oz. per leg.

Never blister the legs of an ill horse, as it throws so much strain on the kidneys, etc., that you are liable to lose the animal. Should the weather be very frosty and cold, blistered legs do not do so well, and most people wait for abreak in the weather. Chestnut and thin-skinned horses do not require so much blister or rubbing in as a thick-skinned one, and the skin is more liable to crack if very severely blistered.

APPLYING THE BLISTER.

After having decided which legs are to be blistered and the blister to be used. have the legs well washed the night before. The best time to blister is in the morning, so as to be able to keep an eye on the animal during the day, as the blister takes effect in about from four to six hours' time after application. Have the horse well secured with rat chains, and, if the fore legs are being blistered, tail towards the manger, as if towards the manger is very liable to cap or kick while stamping from effects of the blister.

Apply in heel, to prevent blister running into it and making a sore place, either a thick coating of lard, zinc ointment, or resin ointment, taking care before rubbing blister in to fill your nails full of the ointment to protect yourself. Well rub in the blister over the parts required for about five minutes, and apply a little over the part when finished rubbing. The horse should be kept tied up on the pillar rein to prevent lying down or gnawing legs, which would blister the belly and lips. It is safer secured with a chain and rope halter, as if one breaks the other holds. Well pack under with straw to prevent injury from kicking. Keep horse well rugged up, and give plenty of hay and half feeds of corn, with an occasional bran mash. The horse must be kept on the pillar reins for quite a week, when it may be turned loose with a cradle on to prevent biting. On the third or fourth day after the blisters have appeared the legs should be dusted with Fuller's earth and half an hour's walking exercise given daily to take off the stiffness, but must be put back on the pillar reins. Short straw should be used for bedding, or ferns, etc.; in fact, anything that is not likely to prick the legs.

Don't use as blisters preparations of turpentine, ammonia, Chinese fly, euphorbium, sulphuric acid, or acetic acid, as they are very liable to blemish and leave bald, unsightly places, which always tell the tale when trying to sell the animal. Paraffin, if well rubbed in will do the same thing, and I have seen horses renhered bald for months by a good dressing of it. Sometimes during blistering the horse is very irritable and nervous, develops a cough, but a few doses of fever medicine or cough electuary soon stop it.

RENEWING T E BLIBTER.

How soon to blister gaain? The animal should be either turned out or let loose in a roomy loose box for a fortnight after being taken off the pillar reins before working or blistering the other legs. Should the horse still be lame, and it is decided to reblister, it is better to wait till all traces of the first application are gone, which is generally in about three weeks to a month's time from doing the legs. It is better to leave the hard scabs on the legs than to try to remove with oil, etc., as they act as a bandage to the parts, and continue to do good until they drop off. If oil is applied it often sets up blistering again by dissolving the cantharides and rendering it active.

Having tried many various kinds of blister during my lifetime, I find that the best and the most lasting results are obtained from the above formulae.—Vet.

Moon Blindness.

T. F. M. has a mare that is troubled quite frequenely with sore eyes. They discharge water and eventually become coated with a bluish film which gradually disappears. This is moon blindness or periodic opthalmia, a disease that usually results in permanent blindness, and little can be done to cure it. During the attacks bathe several times a day with a clean, warm water and drop into the eye a few drops of a solution of boric acid (a teaspoonful to a pint of clean, boiled water). Severe attacks may be relieved by applying a blister of red iodide of mercury about the eye.

Horsemen Attention!

Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Thier use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Glanders, Spavins, Pinkeye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Troubl, Fevers, Cuts, Sores and will remove bunches of all kinds

BEFORE USING

Why have a sick or lame horse, when you can get a reliable and warranted remedy? The leading horsemen of the Dominion endorse Dr. J. Woodbury's Horse Liniment.

Gates' Certain Check

MESSRS. C. GATES, SON & CO.

Dear Sirs:

I have been thinking for some time that I should write and let you know what your "Certain Check" has done for my son. He had such a bad case of Cholera that he was reduced to a a skeleton. We tried doctors, drugs and many other remedies but without avail. Finally we tried your Certain Check and we believe it saved our boy's life, as it cured after everything else had failed.

Your Life of Man Bitters and Invigorating Syrup also cured me of lung trouble, I consider your medicines superior.

W. I. CURTIS, Newcastle, N. B.

CertainCheck never fails and it is sold everywhere at only 25c. per bottle.

Stumbling Horses.

Some horses are naturally addicted to stumbling, others acquire the fault, and still others have the stumbling habit thrust upon them. In the first instance, it is almost incurable, but the second and third causes can be remedied by the driver. If the ground is rough or uneven, horses with a low action are prone to stumble. Other horses, which are naturally slipshod, generally stumble because they do not lift their feet high enough from the ground. Laziness is another cause for stumbling, and horses that are heavy in front, or whose fore legs are weak and unsound, have the same fault. Very often carelessness on the part of the driver causes a horse to stumble. This makes it necessary to always bear in mind the value of keeping horses well in hand and sufficiently reined. If the habit is due to laziness, it can often be cured by riding or driving the horse over rough ground until he has broken off the fault, but in all cases the cure rests with the rider or driver.

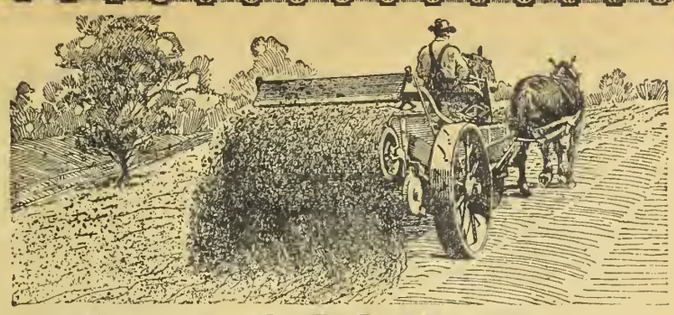
The most sure-footed of horses is bound to stumble at times, but this can be reduced to a minimum by keeping a tight rein. A slack rein is fatigue is the cause, extra care must be taken to keep the horse well up often the sole cause of stumbling. If to the bit. No good horseman will ever take chances on his horse stumbling by allowing a slack rein. Stumbling is not only an annoying habit, but it often results in serious injury and many times in the total disability of the animal. While an habitual tendency to stumble often does not admit a cure, the avesage case can be prevented by the methods that have been suggested above.

To Throw a Horse.

For this purpose a good strong soft hemp rope about 25 yards long is required. Double it in the middle and make a loop at the place large enough to go around the horse's neck close against the shoulder. This loop is placed over the horse's bead and the two free ends are passed between the fore legs, one to the right and the other to the left. These ends are then passed around each hind pastern from the outside to the inside and are carried underneath the line running from between the fore legs then up to and across the side af the shoulder through the loop round the neck. The assistant on the right side stands in front of the horse and the one on the left stands behind. The side lines are then hauled taut, which has the effect of pulling the hind feet up towards the chest and thus the animal is thrown. During this operation the head must be kept well back. The hind legs are then made fast by pulling the feet forward close up to each side of the chest and making a hitch round the pastens. The fore legs are then secured by passing the rope round each pastern at their respective sides and tying them to their hind pasterns.

Inactive Kidneys.

W. H. M. has a mare that passes small quantities of highly colored urine and strains a great deal; there is also a pimply eruption on the skin that is very irritable. It is possible that the condition of the kidneys may be the cause of the skin trouble. I would suggest giving her a heaping teaspoonful twice a day in feed, of a mixture of equal parts of saltpeter and powdered rosin for a week or ten days at a time. For the eruption a tablespoonful of Fowler's solution of arsenic in feed twice a day for ten days, alternating with the powder above.



Seven Solid Reasons

SEVEN solid reasons why each farm needs a manure spreader are these, in the words of a farmer who has devoted much time to correct soil feeding. 1. It saves disagreeable and hard work. 2. It pulverizes and mixes the manure mass. 3. It distributes manure evenly over the field, insuring a good even stand of grain. 4. It prevents loss of nitrogen through fermentation or leaching in the pile when manure is hauled directly from the stable. 5. With it manure can be put on plowed ground in winter to be disked as soon as the ground is fit in spring. 6. It will put manure on meadows as a moisture-preserving mulch and to furnish the grass roots with the liberated plant food. 7. Indirectly, the ease with which it can be handled encourages the owner to care for the manure and place it where it will do most good instead of dumping it anywhere for lack of time or inclination.

I H C Manure Spreaders

Deering and McCormick

will do all these things for their owners. They will do them well and satisfactorily. Choose the right machine for your work and conditions from the complete I H C line. You will find them all styles and sizes, high and low, endless apron or reverse.

I H C manure spreaders are exceedingly durable, strong, correctly built to stand all conditions and all strains they may meet. Each feature has its purpose. Uphill or down, or cutting corners, they spread all kinds of manure evenly, in a light or heavy coat at the choice of the driver. The beater drive is strong and simple, beater teeth are square and chisel pointed to pulverize the manure, and the large diameter of the beater prevents winding. The wide-rimmed rear wheels, carrying a large percentage of the load, insure ample tractive power.

But see all these things yourself at your local agent's. He will explain each one, and many more we have not space to mention here. The agent has catalogues for you, or, write the

SUSSEX, N. B.

POULTRY.

Telling the Laying Hen

To make a success, it is imperative that we know our hens. We must test their abilities. We cannot afford to keep drones.

Therefore, we must adopt methods by which we can determine the good from the bad. Noticing a hen repeatedly upon the nest is not a guarantee that she is about to lay. In using trap nests I have almost daily captured hens on the nest, but no eggs, and their annual records were very low.

Every time a hen cackles when coming off the nest is no criterion that she has laid. I believe it was Collingwood who once said "a cackling hen is either a layer or a liar,"—and in using trap nests—I have found quite a number of these cacklers to be "liars."

So, prior to the adoption of trap nests, the selection of layers has been more or less guess work. It was said by some writers that "spare and leggy birds are the best layers." This opinion, no doubt, was based upon the fact that the Mediterranean class is built after that fashion.

This view was coroborated by the late Francis A. Mortimer, when he said that he found that hens with short legs, chunky bodies, short necks and small heads are, as a rule, indifferent layers. This would seem so from the standpoint that such hens are more of the meat order, but trap nests have told us that during the past few years our chunkiest Wyandottes were in the front row of layers.

Felch said the pullets that commence laying earliest in life are the ones to lay the largest number of eggs through life. There is some logic in that, but we cannot always tell our earliest layers if we have no system of trapping them.

Some years ago there was quite a discussion of the so-called "egg type." But nearly all these opinions were based on the style of the Leghorn, but some writers differed. For example, one writer said that good layers have a "long, slim body, are broad across the shoulders, are triangular, deep in froot, not compact, and have legs of good length." Another differed by saying: "Carefully avoid the leggy, high built, reared up hen of the game-cock style. It is the short-legged, heavy set, motherly-looking hen that shells out the eggs." Many references could be given on this type question, but nearly all differ in some particular, but the opposites, quoted above, are fair samples of representations made in early days.

There is but one sure way of finding out which are our workers; we must catch the hens in the act. Each hen is to be known by the number on her band or ring that is placed on her leg. Catching the hen in the trap nest, her number is ascertained, and this marked on the egg. Each evening after the eggs are gathered these numbers are properly credited on a record blank provided for that purpose. At the end of the year we know for a certainty how many eggs the hen has laid. Not only that, but we also know the size of her egg—whether normal or not—and the color whether white, brown or tinted.

I do not, however, employ trap nests, solely for the purpose of finding out which are my best year-round layers. What I care most to know is which are my best cold-weather layers. I want to know which are the profitable workers during the late fall, winter and early spring—times when eggs bring the best prices. It is not a question with me how many eggs a hen lays in a year, but how much money her product brings. If it is possible to concentrate the bulk of her crop in six months of the year, when prices are high, and induce her to "take it easy" during the warm months, devoting the most of that time to broodiness and molting, I will have stronger and hardier stock and, consequently, more profit.

In conclusion, let me state, that there is but one guaranteed way of determining our profitable layers, and that is by the aid of trap nests, and no poultryman can afford to do with out them. It will mean a profit in the crop, and a saving of feed, room and labor.

While it is best at all times to have good, sharp grit constantly before the fowls, it is especially important that grit be supplied when feeding whole oats so that the hulls of oats, which are very tough and unyielding, will be properly ground. With plenty of sharp grit there is no danger attending oat feeding, although the safest rule is to first soak the oats for an hour in water so that they become more softened.

Green bones are bones fresh from the butcher, with the adhering gristle, meat, etc.

The sooner farmers recognize the fact that poultry culture should be followed on the same line that dairying is—giving food and care to secure results—the sooner will they begin to reap their share of profits and become competitors with practical poultry raisers.

Green bones contain the natural juices as well as the adhering substances, making it superior to the bones that have lain on the ground for a while and lost all the natural juices or animal matter. Green bones are also more soluble and capable of having the mineral matter digested.

In parts of England, turkeys are fattened chiefly on Indian corn, scalded Indian meal and boiled potatoes, with home grown corn for a change.

It is claimed that the most delicious, juicy broiler that an epicure can fancy is a turkey poult about six pounds weight, or when about two-thirds grown, and of medium size. Many a young male two-thirds grown would be too large to broil; if rather large, however, the breast may be gashed, and thus more easily cooked through, but it must not be dried.

The following facts on marketing feathers are well worth remembering: The quills from the third joint or tip end of the wings are called pointers, and should be kept separate. In packing, keep tail and wing feathers separate. Tie each kind in bundles by itself, and press the bundles in the boxes tightly. All feathers must be clean, sound and dry picked. The wing quills which have full plumage on both sides of the quill, which come from the first and second joints of the wing next the body, are more valuable than, and should be kept separate from the pointers. The tail feathers should be kept by themselves and are the most valuable. The short tail and wing quills, if saved, should be kept separate from the long ones, as they depreciate their value if mixed with them. The directions for shipping are to mark the correct weight tare on the boxes, also the name of the shippers, and ship as "turkey quills."

"Utility" does not mean 'mongrelism" any more than "thoroughbred" means "Standard-bred."

The old way of carrying fowls by their legs, or by the wings, is not practised by the present day poultrymen. It is a cruel practise. Holding the fowl firmly by the legs and allowing the body to rest on the arm is a better method.

Fowls are obliged to throw off much of the waste of the body through the lungs. They do not sweat in the sense that do other animals, but instead breathe several times faster than sweating animals when heated. To keep in good health a hen requires nearly seven times the amount of fresh air in proportion to its size as does a horse.

There is as much difference between different families or strains of each breed, as between the different breeds. Therefore, receive with some allowance the praise or condemnation of any breed.

In Paris markets the eggs are dated, and one pays according to the freshness, so that is is possible to be certain of newly-laid eggs, or if it is necessary to be economical, yesterdays eggs, or the day's before, are offered at a reduction.

There are still some people who imagine they can tell the sex of eggs before they are hatched, or as soon as they are laid. Some tell us that long eggs always hatch females, while others say that such eggs invariably hatch males. When it is considered, that each hen shapes her eggs according to the condition of her ovaries, and uniformly lays eggs of similar shape, the absurdity of the shape theory becomes apparent.

A fat young Guinea is a gamey and savory table fowl, though the flesh is dark.

It takes about two weeks to fatten a duck for market.

When the Indian Runner duck has reached a marketable age, she has nearly completed her growth, and has little left to do but complete her plumage and begin to lay.

A little granulated charcoal mixed in the soft food will generally check bowel trouble in chicks.

The much use of cayenne pepper has caused considerable trouble among poultry keepers, and so has overfeeding. The former brings on liver troubles, and the latter leads first to indigestion, then fever, and gangerene of the intestines; or inflammation of the mucous membrane, which is cattarrh or roup; or anthrax, which is black comb; and other fatal disorganizations of the muscular tissues of the liver.

The writer almost daily receives letters asking for cures for ailments in fowls. The bulk of these, at certain times of the year, principally winter, call for cholera cure. When

NA-DRU-CO Tasteless Preparation of **Cod Liver Oil**

Prevents Sickness

Are you one of those thousands who, though apparently well, catch cold easily and often? It's a dangerous condition to tolerate, and one which you can easily prevent by taking two or three bottles of Na-Dru-Co Tasteless Preparation of Cod Liver Oil at once—this Fall.

This pleasant-tasting food-tonic gives tone and vigor to the whole system, and so strengthens lungs and bronchial tubes that they readily throw off the colds which would otherwise take hold of you.

Restores Health

By virtue of its remarkable combination of curative and nutritive properties, Na-Dru-Co Tasteless Cod Liver Oil is one of the very best remedies known for chronic coughs and colds, bronchitis, asthma and catarrh. It is also an excellent reconstructive tonic after fevers, and in diseases such as scrofula and rickets, which are due to constitutional weakness.

Prove its worth by getting a 50c. or $1.00 bottle from your Druggist. 311

the method of feeding is inquired into, it is found that corn is the principal if not the exclusive grain given and the only grit available is some gravel, mostly pebbles. This feeding of corn, with a lack of sharp grit, is the cause of nearly all reported troubles among western poultry—and two-thirds of the complaints come from the western states. —Michael K. Bover.

Layers vs. Show Birds.

To build up a strain of great layers calls for as much scientific knowledge and care as it does to produce superior show birds. But in the work of building up champions of either class a far different treatment exists.

To have strictly first class egg producers, it is necessary that they be bred exclusively for that purpose and after the strain has been established it must be followed by judicious and scientific mating.

It is not so much a matter of breed as it is the way the hens are handled that makes them prolific layers. It was said at one time that Leghorns and the rest of the Mediterranean class were the champion layers, and that the Asiatics were the poorest. Yet we have proof that in very many cases Brahmas outlayed Leghorns. The secret is to breed only from the best layers of the flock, and to have all hatches early. Early layers will as a rule produce early layers. Good layers bequeath their powers to their offspring.

Another point is to stick closely to purebred stock. Of all the phenomenal records we have heard of, not one has been credited to a common scrub hen.

Trap nests must be used in order to become accurate in the work. There is no other positive way of telling how good a hen is. The ability of each hen should be annually noted, and from the cream should come the next generation.

It is important, too, that the stock be strong and rugged. No matter how good utility blood is in the veins of the selected bird, if she is not from a hardy race she will not be able to show her physical powers.

It is a rule among marketmen that a pullet that will not lay before January, and a hen that delays operations until February are poor investments from a laying standpoint. They cost more than they are worth.

It is not always the early layer that gives us the best record. I have had pullets that began laying in October and quit in December, and did not start before February. On the other hand I had pullets begin in December and keep right along.

In creating our laying strains we should aim to have good winter laying rather than a good year-round record. A dozen eggs in winter are worth two dozen in summer. It is not the number of eggs we get but rather the amount of money that we receive for them that counts.

So much for producing our layers; what about our show birds?

The fancier mates according to the "standard" requirements. He does not for a moment stop to inquire how good laying powers the hen has. He does not concern himself about an early egg yield; in fact he does everything to prevent it. A fancier breeding for shows in January takes pains that his pullets do not lay before the exhibitions take place. It is therefore not possible to secure an early and consequently prolific egg strain from stock hatched for January, or even February shows.

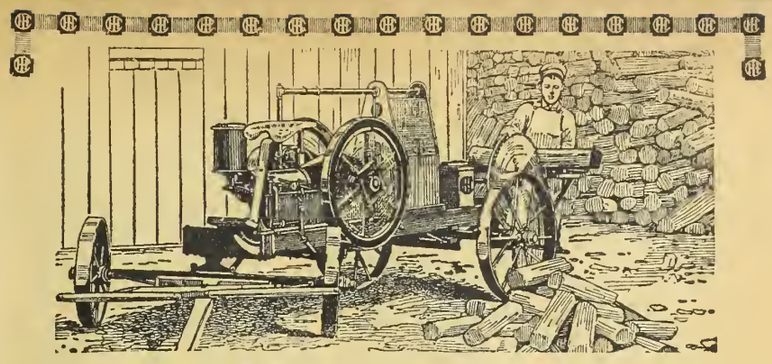
So in breeding, it has been proved that the two strains must be breed separately. Egg-strain fowls are not show birds, and neither are show birds egg strains. One authority tells us that chickens hatched for early shows, November and December, may be much better than those hatched for January and February shows but they will be poorer show birds and, and, in fact, if pullets for the fall shows they would hardly be able to win in mid-winter shows, the laying having developed them into hen shape

The Moulting Period.

Many inquiries are received from time to time as to the proper treatment of fowls during the moulting period, at which time of every year —preferably during the summer months—the fowls should shed their old coat of feathers, which in the course of time are replaced by a new one. It is best to have the moulting period in the summer months. The summer moult usually lasts from eight to ten weeks. Mr. James Shackleton, a well known authority, contends that by feeding specially prepared rations this period may be shortened. The following treatment has been successful in our department for several years. During the early part of July—after the breeding season is over—the fowls were placed on half the usual quantity of rations for 15 or 20 days. The effect of this treatment was the stoppage of egg production and the loosening of the old feathers. At the end of 15 or 20 days the full rations were resumed. A little linseed meal may be added to the mash with benefit on the resumption of full rations. Before the beginning of operations to bring on the moult the cock birds were removed from the breeding pens and placed in compartments by themselves. The hens were then allowed to run in small fields where they could find insect life, clover, grass, etc. In the breeding of fowls during moult care should be observed that they do not become too fat. The fowls are more apt to become over-fat from too generous feeding during the moult than after they got over it and commenced laying. It may be interesting to note that in relation to the annual moult that experience of many years has shown:

1. That yearling hens usually moult earlier and easier than older ones.
2. That moulting is more gradual in some cases than others.
3. That the progeny from parent stock which have moulted during the summer, in the majority of cases, have usually moulted at the same period.
4. That moulting hens are much benefited by a run in a field where clover, grass and insect life may be found.
5. That where moulting fowls are confined to limited quarters that meat in some form and green food should be regularly supplied.

The foregoing information, if followed, will be found of great service to the farmers of the country, and this, I am sure, is what your committee desires. It has direct bearing on the production of eggs and market poultry.—Experimenter.



Buy a Mechanical Drudge

MANY a winter day of back-breaking labor has the average farmer spent stooping over the old buck saw, zr-r-p, zr-r-ping its way through tough wood for the kitchen stove supply. But the wise ones don't do it now. They have a handy engine to run the saw, while they rest.

That engine is about the busiest and most convenient machine the wise man has on his farm. It pumps water for him, runs the separator, washing machine, feed grinder, and grindstone. Often it runs a hay press, small thresher, or a repair shop. The year round it drudges for him. And the wisest man has an

I H C Oil and Gas Engine

because it does most for him at least cost. Its simplicity renders it almost trouble-proof. Its construction makes it easy to start and to operate, and it is most economical in fuel consumption. The best material obtainable goes into its making.

I H C engines are made in all styles—vertical and horizontal, portable, stationary and skidded, air and water cooled. Pumping, sawing and spraying outfits. Sizes from 1 to 50-horse power, to operate on gas, gasoline, naphtha, distillate, kerosene, and alcohol. Oil tractors, 6-12 to 30-60-horse power, for plowing, threshing, etc.

The I H C local agent will show you the engines and tell you all about them. Get catalogues from him, or write the

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

I promised to obey, and went upstairs with my message; thinking, as I went, that if Mr. Dick had been working at his Memorial long, at the same rate as I had seen him working at it, through the open door, when I came down, he was probably getting one very well indeed. I found him still driving at it with a long pen, and his head almost laid upon the paper. He was so intent upon it, that I had ample leisure to observe the large paper kite in a corner, the confusion of bundles of manuscript, the number of pens, and, above all, the quantity of ink (which he seemed ta have in, in half-gallon jars by the dozen), before he observed my being present.

"Ha! Phoebus!" said Mr. Dick, laying down his pen. "How does the world go? I'll tell you what," he added, in a lower tone, "I shouldn't wish it to be mentioned, but it's a —" here he beckoned to me, and put his lips close to my ear—"it's a mad world. Mad as Bedlam, boy!" said Mr. Dick, taking snuff from a round box on the table, and laughing heartily.

Without presuming to give my opinion on this question, I delivered my message.

"Well," said Mr. Dick, in answer, "my compliments to her, and I—I believe I have made a start. I think I have made a start," said Mr. Dick, passing his hand among his grey hair, and casting anything but a confident look at his manuscript. "You have been to school!"

"Yes, sir," I answered; "for a short time."

"Do you recollect the date," said Mr. Dick, looking earnestly at me, and taking up his pen to note it down, "when King Charles the First had his head cut off?"

I said I believed it happened in the year sixteen hundred and forty-nine.

"Well," retarned Mr. Dick, scratching his ear with his pen, and looking dubiously at me. "So the books say; but I don't see how that can be. Because, if it was so long ago,how could the people about him have made that mistake of putting some of the trouble out of his head, after it was taken off, into mine?"

I was very much surprised by the inquiry; but could give no information on this point.

"It's very strange," said Mr. Dick, with a despondent look upon his papers, and with his hand among his hair again, "that I never can get that quite right. I never can make that perfectly clear. But no matter, no matter!" he said cheerfully, and rousing himself, "there's time enough! My compliments to Miss Trotwood, I am getting on very well indeed."

I was going away when he directed my attention to the kite.

"What do you think of that for a kite?" he said.

I answered that it was a beautiful one. I should think it must have been as much as seven feet high.

"I made it. We'll go and fly it, you and I," said Mr. Dick. "Do you see this?"

He showed me that it was covered with manuscript, very closely and laboriously written; but so plainly, that as I looked along the lines, I though I saw some allusion to King Charles the First's head again, in one or two places.

"There's plenty of string," said Mr. Dick, "and when it flies high, it takes the facts a long way. That's my manner of diffusing 'em. I don't know where they may come down. It's according to circumstances, and the wind, and so forth; but I take my chance of that."

His face was so very mild and pleasant, and had something so very reverend in it, though it was hale and hearty, that I was not sure but that he was having a good humored jest with me. So I laughed, and he laughed, and we parted the best friends possible.

"Well, child," said my aunt, when I went down stairs. "And what of Mr. Dick, this morning?"

I informed her that he sent his compliments, and was getting on very well indeed.

"What do you think of him?" said my aunt.

I had some shadowy idea of endeavoring to evade the question by replying that I thought him a very nice gentleman; but my aunt was not to be put off, for she laid her work down in her lap, and said, folding her hands upon it:

"Come! Your sister Betsey Trotwood would have told me what she thought of any one, directly. Be as like your sister as you can, and speak out!"

"Is he—is Mr. Dick—I ask because I don't know, aunt—is he at all out of his mind, then?" I stammered; for I felt I was on dangerous ground.

"Not a morsel," said my aunt.

"Oh, indeed!" I observed faintly.

"If there is anything in the world," said my aunt, with great decision and force of manner, "that Mr. Dick is not, it's that,"

I had nothing better to offer, than another timid "Oh, indeed!"

"He has been called mad," said my aunt. "I have a selfish pleasure in saying that he aas been called mad, or I should not have had the benefit of his society and advice for these last ten years and upwards—in fact, ever since your sister, Betsy Trotwood disappointed me."

"So long as that?" I said.

"And nice people they were who had the audacity to call him mad," pursued my aunt. "Mr. Dick is a sort of distant connection of mine; it doesn't matter how; I needn't enter into that. If it hadn't been for me, his own brother would have him shut up for life. That's all.

I am afraid it was hypocritical in me, but seeing that my aunt felt strongly on the subject, I tried to look as if I felt strongly too.

"A proud fool!" said my aunt. "Because his brother was a little eccentris—though he is not half so eccentric as a good many people—he didn't like to have him visible about his house, and sent him away to some private asylum-place; though he had been left to his particular care by their deceased father, who thought him almost a natural. And a wise man he must have been to think so! Mad himself, no doubt."

Again, as my aunt looked quite convinced, I endeavoured to look quite convinced also.

"So I stepped in," said my aunt, "and made him an offer. I said, your brother's sane—a great deal more sane than you are, or ever will be, it is to be hoped. Let him have his little income, and come and live with me. I am not afraid of him, I am not proud, I am ready to take care of him, and shall not ill-treat him as some people (besides the asylum folks have done. After a good deal of squabbling," said my aunt, "I got him; and he has been here ever since. He is the most friendly and amenable creature in existence; and as for advice!—But nobody knows what that man's mind is, except myself.

My aunt smoothed her dress and shook her head, as if she smoothed defiance of the whole world out of the one, and shook it out of the other.

"He had a favorite sister," said my aunt, "a good creature, and very kind to him. But she did what they all do—took a husband. And he did what they all do—made her wretched. It had such an effect upon the mind of Mr. Dick (that's not madness, I hope!) that, combined with his fear of his brother, and his sense of his unkindness, it threw him into a fever. That was before he came to me, but the recollection of it is oppressive to him even now. Did he say anything to you about King Charles the First, child?"

"Yes, aunt."

"Ah!" said my aunt, rubbing her nose as if she were a little vexed. "That's his allegorical way of expressing it. He connects his illness with great disturbance and agitation, naturally, and that's the figure, or the simile, or whatever it's called, which he chooses to use. And why shouldn't he, if he thinks proper?"

I said: "Certainly, aunt, aunt."

"It's not a business-like way of speaking," said my aunt, "nor a worldly way. I am aware of that; and that's the reason why I insist upon it, that there shan't be a word about it in his Memorial."

"Is it a memorial about his own history that he is writing, aunt?"

"Yes, child," said my aunt, rubbing her nose again. He is memorialising the Lord Chancellor, or the Lord Somebody or other—one of these people, at all events, who are paid to be memorialised—about his affairs. I suppose it will go in, one of these days. He hasn't been able to draw it up yet, without introducing that mode of expressing; but it don't signify; it keeps him employed."

In fact, I found out afterwards that Mr. Dick had ben for upwards of ten years endeavouring to keep King Charles the First out of the Memorial; but he had been constantly getting into it, and was there now.

"I say again," said my aunt, "nobody knows what that man's mind is except myself; and he's the most amenable and friendly creature in existence. If he likes to fly a kite sometimes, what of that! Franklin used to fly a kite. He was a Quaker, or something of that sort, if I am not mistaken. And a Quaker flying a kite is a much more ridiculous object than anybody else."

If I could have supposed that my aunt had recounted these particulars for my especial behoof, and as a piece of confidence in me, I should have felt very much distinguished, and should have augured favorably from such a mark of her good opinion. But I could hardly help observing that she had launched into them chiefly because the question was raised in her own mind, and with very little reference to me, though she had addressed herself to me in the absence of anybody else.

At the same time, I must say that the generosity of her companionship for poor harmless Mr. Dick, not only inspired my young breast with some selfish hope for myelf, but warmed it unselfishly towards her. I believe that I began to know that there was something about my aunt, notwithstanding her many eccentricities and odd humours, to be honoured and trusted in. Though she was just as sharp that day, as on the day before, and was in and out about the donkeys just as often, and was thrown into a tremendous state of indignation, when a young man, going by, ogled Janet at the window (which was one of the greatest misdemeanors that could be committed against my aunt's dignity), she seemed to me to command more of my respect, if not less of fear.

The anxiety I underwent, in the interval which necessarily elapsed before a reply rould be received to her letter to Mr. Murdstone, was extreme; but I made an endeavour to suppress it, and to be as agreeable as I could in a quiet way, both to my aunt and Mr. Dick. The latter and I would have gone out to fly the great kite; but that I still had no other clothes than the anything but ornamental garments with which I had been decorated on the first day, and which confined me to the house, except for an hour after dark, when my aunt, for my health's sake, paraded me up and down on the cliff outside before going to bed. At length the reply from Mr. Murdstone came, and my aunt informed me, to my infinite terror, that he was coming to speak to

BIG, HEARTY BABY BOY

Mrs. Beck's Fondest Hopes Realized—Health, Happiness and Baby.

Upper Lahave, N. S., Can.,—"I wish to thank you for the benefit I received by taking Lydia E. Pinkham's Vegetable Compound for female troubles from which I was a great sufferer, so that I was completely run down in health. Other medicine did not help me, but Lydia E. Pinkham's Vegetable Compound made me well and strong. I now have a big, hearty baby boy, and praise your medicine for the wonderful lot of good it has done me." — Mrs. ISRAEL BECK, JR., Upper Lahave, Lunenburg Co., N. S., Canada.

The darkest days of husband and wife are when they come to look forward to a childless and lonely old age.

Many a wife has found herself incapable of motherhood owing to some derangement of the feminine system, often curable by the proper remedies.

In many homes once childless there are now children because of the fact that Lydia E. Pinkham's Vegetable Compound makes women normal.

If you have the slightest doubt that Lydia E. Pinkham's Vegetable Compound will help you, write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass., for advice. Your letter will be opened, read and answered by a woman, and held in strict confidence.

FITS CURED Send for Free Book giving full particulars of TRENCH'S REMEDY, the world-famous cure for Epilepsy and Fits—Simple home treatment. 25 years' success. Testimonials from all parts of the world; over 1,000 in one year.

TRENCH'S REMEDIES Limited, 434 St. James' Chambers, TORONTO

Here is a woman who speaks from personal knowledge and long experience, viz.; Mrs. P. H. Brogan, of Wilson, Pa., who says, "I know from experience that Chamberlain's Cough Remedy is far superiot to any other. For croup there is nothing that excels it." For sale by all dealers.

her himself on the next day. On the next day, still bundled up in my curious habiliments, I sat counting the time, flushed and heated by the conflict of sinking hopes and rising fears within me; and waiting to be startled by the sight of the gloomy face, whose non-arrival startled me every minute.

My aunt was a little more imperious and stern than usual, but I observed no other token of her preparing herself to receive the visitor so much dreaded by me. She sat at work in the window, and I sat by, with my thoughts running astray on all possible and impossible results of Mr. Murdstone's visit, until pretty late in the afternoon. Our dinner had been indefinitely postponed; but it was growing so late, that my aunt had ordered it to be got ready, when she gave a sudden alarm of donkeys, and to my consternation and amazement, I beheld Miss Murdstone, on a side-saddle, ride deliberately over the sacred piece of green, and stop in front of the house, looking about her.

"Go along with you!" cried my aunt, shaving her head and fist at the window. "You have no business there. How dare you trespass? Go along! Oh! you bold-faced thing!"

My aunt was so exasperated by the coolness with which Miss Murdstone looked about her, that I really believe she was motionless, and unable for the moment to dart out according to custom. I seized the opportunity to inform her who it was; and that the gentleman now coming near the offender (for the way up was very steep, and he had dropped behind), was Mr. Murdstone himself.

"I don't care who it is!" cried my aunt, still shaking her head, and gestulating anything but welcome from the bow-window. "I won't be trespassed upon. I won't allow it. Go away! Janet, turn him round. Lead him off!" and I saw, from behind my aunt, a sort of hurried battle-piece, in whicn the donkey stood resisting everybody, with all his four legs planted different ways, while Janet tried to pull him round by the bridle Mr. Murdstone tried to lead him on, Miss Murdstone struck at Janet with a parasol, and several boys, who had come to see the engagement, shouted vigorously. But my aunt, suddenly descrying among them the young malefactor who was the donkey's guardian, and who was one of the most inveterate offenders against her, though hardly in his teens, rushed out to the scene of action, pounced upon him, captured him, dragged him, with his jacket over his head and his heels grading the ground, into the garden, and, calling upon Janet to fetch the constables and justices, that he might be taken, tried and executed on the spot, held him at bay there. This part of the business, however, did not last long; for the young rascal, being expert at a variety of feints and dodges, of which my aunt had no conception, soon went whooping away, leaving some deep impressions of his nailed boots in the flower beds, and taking his donkey in triumph with him.

Miss Murdstone, during the latter portion of the contest had dismounted, and was now waiting with her brother at the bottom of the steps until my aunt should be at leisure to rereive them. My aunt, a little ruffled by the combat, marched past them into the house, with great dignity, and took no notice of their presence, until they were announced by Janet.

Continued in next issue.

Uses for Sawdust.

Not so very long ago about the only real use anycne had for sawdyst was for packing ice. That was when small local saw mills were more common, and the amount of this form of waste wood was, or at any rate appaared, comparatively small. Now, when the tendency is to consolidate these into large mills with a capacity of several hundred thousand feet of lumber per day, the daily waste in sawdust is seen to be enormous and much experimenting is being done to discover new methods of utilizing it.

Perhaps the most promising venture in sawdust utilization in this country is the manufacture of ethyl (or grain) alcohol. The sawdust is treated with sulphuric acid under suitable conditions, resultibg in the formation of sugar, which is then fermented to produce alcohol. Several plants have been erected to produce alcohol from wood in this manner, and, though there are some difficulties still to be overcome, the ultimate success of the process on a commercial scale is assured.

Sawdust has been successfully manufactured into briquets for fuel for a considerable time in Europe by a very simple process. The shavings and sawdust are first steam-dried, the water contained in the wood being thus evaporated and the resin almost liquified. The sawdust is then compressed under heat into briquets of the desired size. they contain resin acting as a binder. A firm in Vancouver is engaged in a similar line of manufacture, the sawdust being com-

HAD A TERRIBLE ATTACK OF DIARRHŒA.

Became Very Weak.

Diarrhœa, especially if allowed to run any length of time, causes great weakness, and the only thing to do is to check it on its first appearance. You will find that a few doses of DR. FOWLER'S EXTRACT OF WILD STRAWBERRY will do this quickly and effectively.

MRS. JACOB SMITH, Manor, Sask., writes:—"I am pleased to express my gratitude for your remedy. In my case, I had a terrible attack of diarrhœa. Just about every three minutes, I would have a passage, and it would keep this up for a week at a time, causing the passing of bloody water. I was so pained and weak, I could not do anything.

'Seing your DR. FOWLER'S EXTRACT OF WILD STRAWBERRY recommended, I tried it and it thoroughly cured me. It is the only medicine for this complaint I will now have.'"

"DR. FOWLER'S" has been on the market for over sixty-five years, and is, without a doubt, the best remedy known for the cure of Diarrhœa, Dysentery, Colic, Cramps, Pain in the Stomach, Cholera Morbus, Cholera Infantum, and all Bowel Complaints.

When you ask for "DR. FOWLER'S" see that you are not handed one of the many substitutes for this old reliable remedy.

One Cent a Word Ads.

Two letters last week from one cent a word advertisers, express to the Maritime Farmer their appreciation of the gratifying results following their investments. In each case tne amount invested was trivial. But it brought profits in the way of increased prices for articles offered for sale that surprised the advertisers. While one cent a word ads. are cheap, they are wonderful little messengers. They work while you work, or while you sleep for that matter, telling your story to thousands of Maritime Farmer readers. They never remain idle for a second; so when you want to sell something or buy something or do a hundred and one other things you want the public to know about, mail your one cent a word ad. to the Maritime Farmer, Sussex. As has been observed before the results will surprise you and the profits amaze you. In like manner if you want to get something, read the little ads. They may discover for you just what you have been looking for. Cash must accompany all ads. No ad. less than 25 cents.

Farmer Ads. will Bring Results.

It costs only a one cent Postal card to answer any advertisement in Maritime Farmer and you will get many dollars worth of information.

Canning Methods, Old and New.

For the past few years many housekeepers have somewhat given up the old-fashioned idea of canning fruit and vegetables and depended instead to a great extent upon store goods. Now the pendilum seems to be swinging again toward old-fashioned cooking, and home canned things are once more coming into their own. Certainly the factory canned goods are not as economical nor do they compare with home-made goods in richness or flavor. Some housekeepers claim that they have no luck in putting up fruit, but investigation shows that their luck may be accounted for in their disregard of a few general rules that make for success.

In the first place, the fruit or vegetables selected for canning must be perfectly sound, free from spot and just ripe. Underripe or overripe fruit will not be a success. They must be canned as soon after picking as possible, for both vegetables and fruit lose their flavor by standing around for any length of time.

Use an aluminum or enamel lined kettle for cooking and a wooden spoon for stirring, as metals are affected by the acid in the fruit. A gas stove is very convenient to use in canning or preserving, as the heat is more regular than that from the range and, too, the heat can be quickly regulated when necessary. Sterilize every jar and top used and buy new rubbers each season. The wide-mouthed jar is the best to use, as the fruit can be put in whole and the glass top is to be preferred, as the metal tops are apt to be damaged in opening the can.

The process of cooking most of the fruits and vegetables in the can is one that appeals to the housekeeper, both for its economy of time and for the results obtained. By this process none of the flavot is lost.

To can vegetables, pack the jars tightly with the uncooked material, pour over it cold water to cover, screw on the tops, not using the rubbers, and place the jars in a boiler. Do not allow them to rest directly on the bottom of the boiler. A piece of board cut to fit the boiler and having a double row of auger holes in it is the best thing for the jar to rest upon. However, straw may be used, or even folded newspaper will do. After putting the jars in the boiler so that they do not touch each other, pour in cold water around them until it nearly reaches the top of the jars. Cover the boiler tightly to keep in the steam and cook until the vegetables are tender. The time varies with different vegetables. They may be tested with a fork and when found to be tender, fill the jars to overflowing with boiling salted water, put on the rubbers and screw down the tops. Turn the jars upside down to see if any liquid escapes and then put them out of a draft to cool. Screw the tops again before putting them away, as they loosen while cooling, and store them away in a cool, dark place.

Fruit is canned by this same process, with the exception of using a rich boiling syrup of sugar and water or fruit juice to fill the jars in place of the salted water used with the vegetables. About two cups of sugar to one of water is the correct proportion to use in making the syrup. The cooking of fruit by this process takes from twenty minutes to a half hour.

Be sure to not put on the rubbers until after cooking, as the heat destroys the elasticity of the rubber and the contents of the jars will spoil. One housekeeper who had no luck in canning disregarded this important point and lost 20 jars. In-

Make Your Coal Oil Lamp Burn Gas.

The New "Great White Light" Burner Turns Ordinary Kerosine Illumination Into

GASLIGHT

"ASK THE USER"

"Great White Light" Burners speak for themselves, prove their worth, make friends—
IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Light" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosine oil.

THE PROBLEM OF PERFECT COMBUSTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of Oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the Interior of the dome of the "Great White Light" Burner are the marvellous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosine oil. The discovery of the scientific action obtained by the use of the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it toward the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oxygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely diffenent, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyone, whether new or renewal subscription. When sending in money state which size you want. Send today.

We guarantee these burners to do as represented or money refunded.

The Maritime Farmer

SUSSEX, N. B.

We do not sell these burners but each subscriber may get two besides one we furnish free by sending 35 cents for each additional one wanted.

A Municipal Opportunity

"Indications are that municipal debentures are strongly coming back into favor with Maritime investors. The trouble now appears to be not to buyers—but to find debentures to satisfy the many enquiries. This active demand is confined almost altogether to the issues of the larger and better known towns, whose securities belong to the 'gilt edge' class, and of which the supply is pretty well exhausted.

The above paragraph is from last week's Mackintosh's Investment News," Since it was written we have been fortunate in securing some municipal debentures of this "gilt-edge" class, namely:—Town of New Glasgow Fives, due 1955, and which we quote at 100 per cent. and interest to yield a full 5 per cent. income. As we expect our holdings to be quickly taken up we advise immediate action.

stead of cooking fruit in the boiler, it may be cooked in the oven by putting the jars in a draining pan with about two inches of water around them. When tender, fill the jars with the syrup or from the contents o one of the jars of fruit.

Peaches and pears may have a bit of candied lemon peel placed in the top of the jar with a brandied paper over all before sealing. All candied goods must be kept in a cool, dark place, as light and heat injure their keeping qualities.

JELLY POINTERS.

There are a few points to be remembered in making jellies. Cooks af the old school claim that jelly must be made on a clear day to be a success. The fruit must be sound, not overripe,and should be cooked in an enamel pan at an even temperature. As little water as possible must be added. Make a few cups at one boiling.

Strain all fruit for jelly without pressure, as the forcing of the jelly through the straining cloth causes a cloudy jelly. The draining bag made in a three-cornered shape will facilitate matters. Most jelly is made cup for cup, that is, a cup of sugar to a cup of juice. When a little cooled on a saucer appears firm, it is done. Pour it into glasses and cover with melted paraffin. The paraffin can be kept hot in a small pitcher and poured out as needed. A small sweet geranium leaf added to jelly gives a good flavor.

Rhubarb Jelly: Cover the rhubarb, cut in small pieces, skin and all, with cold water, and cook until tender. Allow it to drip through a cheese cloth bag and to one cup of juice add a cup of sugar and boil a half hour. Dissolve gelatine in cold water, one teaspoonful to a quart of juice, and after adding it to the rhubarb and sugar put it into the glasses.

Crab Apple Jelly: Cut up the apples and cover them with water, boil until tender. Put them in a cheese-cloth bag and drain overnight. In the morning, add one cup of sugar to two of juice and boil until it jellies.

Perspiration and Health.

Men die of kidney disease because the kidneys are worn out and poisoned. The kidneys are compelled to do the work to carry on the processes of elimination which really ought to be attended to by the pores in the skin. There are spread over the surface of your body, if you are a man of average size, about seven million pores. Each is a quarter inch deep. These pores day and night eliminate from the body its poisons and impurities. If you don't take exercise if you don't perspire and keep the pores open, the work which those pores should do is thrown upon the kidneys. The kidneys cannot do the work. Your blood is poisoned, and kidney disease comes along to claim you. A keen student of health remarked the other day that in winter there are many more deaths from kidney disease than in summer. This is due, of course, to the fact that in winter the pores of the man who does not take exercise are even more clogged up than usual. Heat alone opens the pores in summer to some extent, although not enough.

Tired Feet.

When the feet are weary and tender owing to long standing or walking during the day, nothing will give more relief than a warm footbath in which has been dissolved a handful or two of sea salt. Bathe the feet and legs with this for about ten minutes, and then rub them well with a good rough towel. The effect is delightfully refreshing.

MME. MELBA

The world renowned singer who holds undisputed sway as Queen of the Lyric Stage, has made her choice of the—

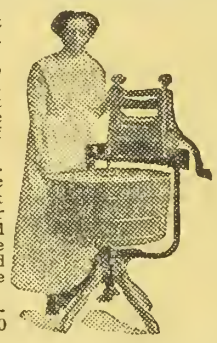
THIS WASHER MUST PAY FOR ITSELF.

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse, but, I didn't know anything about horses much. And I didn't know the man very well either



So I told him I wanted to try the horse for a month. He said "All right," but pay me first, and I'll give you back your money if the horse isn't all right."

Well, I didn't like that. I was afraid the horse was'nt "all right" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse, although I wanted it badly. Now, this set me thinking.

You see I make Washing Machines—the "1900 Gravity" Washer.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me. You see I sell my Washing Machines by mail. I have sold over half a million that way. So, thought I, it is only fair enough to let people try my Washing Machines for a month, before they pay for them, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six Minutes. I know no other machine ever invented can do that, without wearing the clothes. Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman, and it don't wear the clothes, fray the edges, nor break buttons, the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first, and I'll make good the offer every time.

Let me send you a "1900 Gravity" Washer on a month's free trial. I'll pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight too. Surely that is fair enough, isn't it.

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months in wear and tear on the clothes alone. And then it will save 50 to 75 cents a week over that in washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week, send me 50 cents a week 'till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line to-day, and let me send you a book about the "1900 Gravity" Washer that washes clothes in six minutes.

86 Pages of Personal Advice

Free To Any Man

MANLY, VIGOROUS MEN RULE THE WORLD

MY DEAR READER:

In the handsomely printed little book or private pocket compendium for men (containing 8,000 words and 40 half-tone photo-reproductions), which I publish and gladly forward by mail, free, sealed to any man anywhere in the world who sends me the free coupon below, I have included certain parts that contain some very important advice or suggestions of a strictly personal nature, which, I believe, cannot be found in any of the Private Hygiene books for men that are now sold at high prices all over the country. It will thus be seen I have endeavored, through the medium of my free book, to give my readers absolutely free of cost really MORE, in some respects, than others offer and make a large charge for. All you have to do to get this free book of mine is to use the coupon below, or if in my neighborhood, I extend an invitation to you to call at my office. Please remember that this free offer involves absolutely no obligation on your part, and there is nothing whatsoever for you to pay, and nothing whatsoever for you to buy in any way, unless you should decide at some time in the future that you would like to try one of my mechanical VITALIZERS (described below), but that rests entirely with yourself. Over a million of these little free books have now been sent to men who wrote for them, as I want you to do, and who live in all quarters of the globe. I publish this free book in English, Swedish, Danish, Finnish, German. French and Polish, but I always send the English edition of course, unless otherwise instructed. Kindly use the little coupon.

SANDEN, AUTHOR.

In reference to manly strength, I believe it is now more generally acknowledged than ever before that the manly man stands back of all that makes for progress, development and achievement in the world, a truth which any of us can easily verify if we but look about us with impartial eyes.

As a matter of fact, the man who is debilitated, unstrung and enervated cannot, for perfectly obvious reasons, expect to approach those real and masterful attainments which seem but a natural and easy accomplishment for him whose nerve force, brain power and manly strength are perfectly normal. Hence, we acknowledge the debilitated, weakened man to be handicapped in every walk of life where real manhood counts, yet it would indeed be cruel of me to here so state the fact in public print were I not of the honest opinion that there is every hope for the unmanly man to restore himself to a state of health and vigor, if he but clear his mind of abnormal fear, and then make a fair, square effort to redeem himself.

There are two specimens of humanity for which I have no earthly use. One is the man who, though now strong and vital, yet plunges into dissipation and excess with the certain knowledge of his unmanly fate. The other is the man who, though knowingly debilitated and enervated, makes no effort to get away from his life of dissipation and wrong practices. As a matter of fact, there is no hope for either of these unfortunates But for him who acknowledges his errors, who may come to me and say. "I have paid the penalty of my past follies, but I am THROUGH with my life of dissipation, and I am going to make a manly effort to restore myself," to such a man, I care not what his physical condition may be, I can say in all truthfulness, "You, my friend, are on the right road to new strength and new manhood", for he really is, and there is no doubt about it.

I make a little appliance that I call a VITALIZER, which I designed to aid just such men who seek manly strength. I am not offering this VITALIZER here for sale, but merely suggest that you, reader, take the opportunity to learn all about what this little appliance is doing today everywhere throughout the world; then, if in the future you want to use one yourself and will so write me, I will gladly make some liberal proposition whereby you may have one to try. The VITALIZER is fully described in one section of the free book which the coupon below entitles you to.

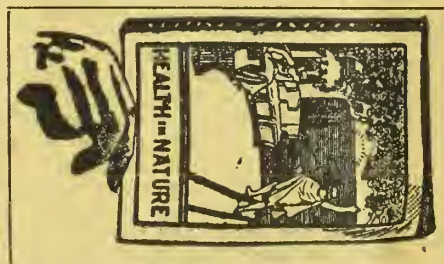
The VITALIZER is made up in a very light form weighing only several ounces, and you wear it on your body all night. It generates a great, soft, pleasant FORCE which I call VIGOR, and which flows in a continuous stream into your nerves, organs, blood and muscles while you sleep. I am satisfied in my own mind that I have access to a great POWER in this little VITALIZER which in the future will be more and more relied upon all over the world in the treatment of debilities and nerve weaknesses.

With special attachments which carry the FORCE of the VITALIZER to any part of the body, it may be used by women as well as men for the treatment of rheumatism, kidney, liver, stomach, bladder, disorders, nervousness, lack of energy, etc. Therefore, please send for the book today, or if you happen to live in or near this city, I should be very glad to see you in person. Office hours, 9 to 6.

WHAT THE FREE BOOK TEACHES YOU

The little free illustrated book of special private information, referred to above, is meant really to be a self guide for all men through the years before and after marriage and onward to a ripe old age. It is written in perfectly plain language, entirely free from technical terms, so that any one may easily grasp the full power of its good advice from two or three careful readings. It attempts to point out a safe road to new manhood or new manly strength, and as such is dedicated to mankind generally. One part of this book fully describes my little VITALIZER referred to above.

Remember, as soon as the coupon below is received I agree to forward to you one copy of this illustrated booklet, absolutely free of charge and in a plain, sealed envelope, so that it will come to you privately, just as you receive any sealed mail.



DR. M, F. SANDEN CO.,
140 Yonge St., Toronto. Ont.

Dear Sirs—Please forward me your book, as advertised, free, sealed.

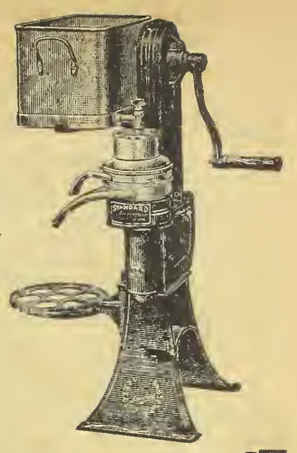
Shropshire, Pure Bred—Ram, 2 shears and over, 1, B. B. Killam; 2, John C. Corning; 3, Mrs. Geo. Sherman.—Ewe, 2 shears and over, 1 and 2, John C. Corning; 3, J. R. Golden.—Ewe, shearling, 1 and 2, John C. Corning.—Ewe lamb, 1 and 2, John C. Corning.

Oxford Downs, Pure Bred—Ram, 2

(Continued on page 64.)

Right Up To The Last Minute



There is no complicated "nest of gears"—no hard-to-clean "contraptions" in the bowl—no oil cups or glass lubricators—on the

Standard

cream separator. There's nothing "obsolete" in the whole machine. It's right up to the last minute. Built of the best materials by the most costly machines, and rigidly tested.

The few, simple working parts can be held in one hand. Every gear and bearing runs in a bath of oil, and machine needs to be oiled but once in four months. Wide-open bowl and perfectly smooth discs easily cleaned. Supply can about a foot lower than most machines. Crank four inches higher, eliminating back-breaking stooping. All working parts enclosed, keeping out dust and making it impossible for children to get hands or clothes injured.

These are some of the features that go to prove the Standard's up-to-dateness. Others are told about in our new catalog, which also shows the new records for close skimming established by the Standard at Government Dairy Schools. Write for a copy of this new catalog.

Keeping Food in Summer.

The United States Department of Agriculture recently issued the following practical suggestions in regard to keeping food and drink in hot weather, with a view to helping the public avoid sickness from eating spoiled articles of diet:

While people should be careful about the condition of the food they eat at all seasons of the year, they should be particularly watchful during the summer months. In hot weather, bacteria multiply far more rapidly than in cold weather and produce chemical changes in some foods which greatly lessen their nutritive value and often make them unfit for human consumption. Unfortunately, there is no quick, absolute, simple, practical way of determining the presence of hurtful bacilli in foods, or of obtaining positive evidence of the existence of ptomaines. The average family does not have the delicate apparatus needed for these tests, nor the skill to detect these micro-organisms.

The housewife will find eyes and nose the safest practical detectives of bad food in hot weather. If any article has any suspicion of an unusual odor or looks abnormal, it should be avoided. People eating in doubtful restaurants should be particularly careful about meats or fish cooked with a highly spiced or aromatic sauce which might disguise a bad taste or warning odor. Only sweet smelling, clean food should be eaten. Spotted, green, slimy, or frothy raw meat, or meat which is soft in spots also should be regarded with suspicion. Taste of course is a supplementary test, but one to be used after eyes, nose and fingers. A mother before she allowed her child to eat anything should examine it carefully in a good light, smell it, and finally taste it.

Milk particularly deteriorates rapidly under summer heat, especially if it already contains bacteria. Housewives, therefore, should see to it that their milk after being left by the milkman does not stand for any length of time on a hot back porch or stoop before it is put in the ice box. Milk bottles should be kept closed, both in the ice box and out of it. If there is any doubt at all as to the excellence of the local milk supply, pasteurize all milk.

All foods should be kept covered or wrapped, and always out of the reach of flies, which are deadly carriers of typhoid. All vessels, pitchers, etc., in which food is to be stored should first be scalded. Food should be handled as little as possible. The ice box, especially its drain pipe, should be cleaned thoroughly and frequently with boiling water and washing soda, and given an occasional airing. A persistent battle should be waged against flies in all parts of the home.

Uncooked foods as a general proposition should be avoided. Children should not be allowed to eat the skins of fruits, especially fruits which have been exposed to flies or street dirt on unscreened stands or push-carts.

Those who go away for vacation should not get the idea that everything in a summer resort or strange city is necessarily pure and wholesome. The danger of typhoid fever in country resorts is very great. Many of the cases of typhoid fever recorded in the fall in cities where the water is pure had their origin in water or contaminated substances drunk or eaten at some summer resort. Insist on boiled water. If you absolutely cannot get boiled water, make very sure about the reputation of springs, wells, or tap water. Refuse absolutely to take any water that comes from a source near an outhouse or stable, or in a neighborhood where fever is at all prevalent.

Boiled water can be made just as palatable as unboiled water. The flat taste which boiled water has soon after it has been boiled is due to the fact that boiling drives out of it the air which it held in solution. If the water after boiling is put in scalded shallow open pans and allowed to stand for 44 hours where flies or dirt cannot get at it, it will regain its air and have its usual taste restored by the second day.

Finally, it is particularly important in summer that people should not be misled into believing that the label, "Guaranteed under Food and Drugs Act," on cans and packages means that the government has tested these foods and pronounced them pure and desirable. The government does not make the guarantees. The guarantee is made wholly by the manufacturer, and means no more than when your own corner grocer guarantees that the sugar he weighs out for you is all right. Examine goods labeled "guaranteed," just as carefully as any other kind.

The Business of Living.

Do you ever stop to ask yourself why you are slaving away from morning until night? Is it for the doubtful satisfaction of laying up money in the bank, or buying more land, of being able to retire to town in your old age. Are any of these objects worth struggling towards through good health and ill? Today, with its small measures of twenty-four hours is all we have to use. Shall we live today or shall we give it with its drudgery and weariness to buy some glorious tomorrow which we may not be spared to enjoy?

I am afraid that in too many of our homes we are trying to run a bank account with life in which we hope to deposit many years of toil and backaches and meagre living and lonliness and draw out a few years of comfort and sociability at the end.

I have seen it happen so often that just as a man or a woman had decided that they could give up and take it a little easier the over-worked machinery, which is the body, slipped a cog and they passed into the great beyond without ever having drawn their interest.

It always gives me a queer little gripping feeling at the throat to see this, for I feel that these people have passed through life without having learned how to live.

That is why I am writing today to ask farm men and women who are hording up money while they live in the same old incommodious houses to bide-a-wee and think whether it is not better worth while to spend four or five hundred dollars now on installing a furnace, a water system, a lighting plant, a power washer and a gasoline engine to run it and the churn and the cream separator than to drag out an over-worked existence for another ten years.

Life is not measurable in dollars and cents but in the happiness and sweetness it has contained and it does not pay to put off taking its good things for too many years. It is better to gather the flowers of summer as we go and then if our summons comes early we will not have to leave behind us a barren stretch of years unfruitful in everything but wealth.

Cramp in the Leg.

a good strong cord (a long garter will do if nothing else is handy), and when the cramp comes on take the cord, wind it round the leg over the place that is cramped, take an end in each hand, and give it a sharp pull —one that will hurt a little. Instantly the cramp will depart, and the sufferer can go to bed assured it will not come on again that night.

Fancied Complaints.

A well-known doctor once gravely aserted that a third of the cases of illness of patients which came under his notice were neither more or less than imaginary, and yet it was impossible for him to tell his patients so without giving mortal offence, as their ill-health gave them a distinction which was gratifying to their self-love. If these people are told the honest truth, the result is sometimes real illness, for, having taken from them the fancied necessity for coddling themselves, life's interest and occupation would be gone, and the consequent nervous depression would seriously affect their health.

The Hydraulic Ram.

To most people an hydraulic ram is a mystery. As a matter of fact, it is the most simple and efficient mechanical device for raising water by water power. This is probably what makes it seem so mysterious to those who have never seen a ram at work.

Hydraulic rams are not only adaptable for pumping water for household purposes, but they can be used for delivering large quantities of water for irrigation, town water works, railroad tanks, etc. Where the least possible expense must be incurred for pumping water for any of these purposes, there is naturally a great demand for rams. This applies particularly to irrigation as it enables the farmer to raise crops at a minimum cost per acre.

Hydraulic rams can derive the power for operating them from a spring, brook, flowing artesian well or river. If the ram can be located at such a point that a constant stream of water can be supplied to it through a pipe having an incline or fall of three or more feet in a given distance, the conditions being such that the power water which escapes at the ram can be drained away, it is possible for the ram to deliver a steady stream of water to a point at an elevation 30 times the difference between the levels of the ram and the water supply. This stream of water once started flowing, will continue without interruption, day and night, winter and summer, requiring no attention nor expense except for the renewal of rubber valves. This is a trifling expense, as the valves cost but little.

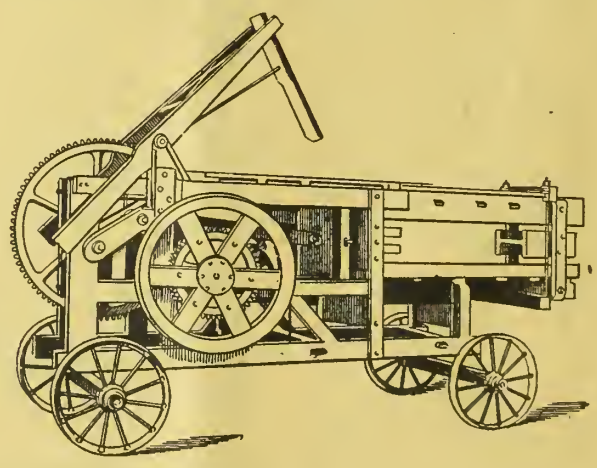
The efficiency of a ram can be very great, reaching, under favorable conditions, 80 per cent or more. This means that the ram will pump more water to the same height than any other kind of egine which pumps water by means of water power.

The amount of water that may be pumped per day by such a ram is remarkable. It will pump as much as 250,000 gallons a day. If a delivery of 2,000,000 gallons a day is required, a "battery" of rams can be installed. That is, two or more rams are placed side by side.

Where pneumatic pressure tanks are used instead of gravity tanks, rams will not only supply the water, but also maintain the air pressure up to 100 pounds, as may be desired — Scientific American.

Hay Presses & Woodcutters

Our Hay Press is operated by either Steam, Gasoline Engine or Tread Power. The whole machine is so powerfully constructed that no jar is felt in any part when in operation. The Bale Box is steel lined. The Side Springs, which are thoroughlv tested, are made of the best quality of Spring Steel, The Folder is located to do perfect work, and requires but a slight spring pressure to operate.



We manufacture our Woodcutters in four different sizes and styles: two styles Long Swing, Short Swing and Flat Roller Table.
All our machines are guaranteed for a year against any defects in workmanship and material.

Write for Catalogue and prices.

What We Gain by Rotation.

In the first place we get a greater return from the soil by rotating our crops, taking one year with another This has been demonstrated time after time, though the cause is not always apparent.

By rotating, soil will produce more even if no manure is applied. But it must be recognized that in that case the plant food in the soil is being depleted more rapidly than it would be if only one crop were grown. After all it is the taking of plant food out of the soil and turning it into merchantable products that makes money for the farmer, so we can afford to rotate to a limited extent.

I do not wish to be understood as saying that our sole aim should be to take plant food out and turn it into cash but let the cash crop come in the rotation after the soil has had a good feed.

Freedom from insects is helped by rotation. Certain insects are peculiar to certain crops. It generally takes a few years for a certain kind of crop to become infested with such insects. If the crop is taken off the field, and another put on as soon as the insects get bad, it will prove a check to the insects. This is notably so with the bill bugs that sometimes infest corn fields and with the wire worms that infest old meadows.

Grass lands are probably more improved by rotating than any other crop of the farm, for the reason that many of our old meadows are infested with insects and have been mown so long that they have become thin. It is noticeable that a thin meadow plowed up and put into a cultivated crop will, when again put into grass, produce remarkably well.

While the rotation of the meadows [illegible] is not always desirable, in the main it enormously increases the production of that land. I remember on large fields that had been devoted to grass growing for so many years that the sod had become thin and the grass on it was hardly worth cutting. It was plowed up and put into potatoes and cultivated crops for three years after which it was returned to grass land.

For several years after the grass grew so high and the hay made from it was thick, that it was always a question as to how it could be properly cured.

Destruction of weeds is one of the things we gain to a considerable extent by rotating our crops. When such things as the wild morning-glory and the wild onion appear in the grain fields, rotation becomes a necessity. The crop that requires the most cultivation and that will pay best by such cultivation is the best weed killer.—Ex.

Bang System Vindicated.

Readers of farm papers, who have followed the cattle tuberculosis question at all carefully are familiar with the Bang system, which is the segregation of the healthy animals in a diseased herd, or more particularly the offspring of the tuberculous parents, by removing them after birth and keeping them from chance of infection. A very interesting experiment in this connection has been made under way at the Woburn Experiment Station in England, and the results so far corroborate emphatically the conclusions of Dr. Bang, the Danish Scientist. A farm of fifty acres was taken over for this purpose three years ago. The Royal Agricultural Society under whose direction the experiment is being conducted, obtained cows that were known to be tuberculous, that had reacted to the test and were very miserable specimens. When they calved the offspring were brought straight away without getting a drop of their mother's milk, to this farm, where they were fed on sterilized milk and cooked foods, and kept apart from other stock. The man in charge did not go to the main farm at all, and did nothing but look after the animals. Fifteen calves, nine bullocks and six heifers were raised. These were fed until just over two years of age, and on May 24th last the steers were killed. They had previously been tested for tuberculosis, and in no case was there any sign of the disease, and when killed at Islington market were found entirely free from it. The heifers were served by bulls previously tested, and all were put in calf. Three calves have already been produced. The calves will be kept for a month and slaughtered with their parents. If they turn out to be free from the disease it will be conclusive proof of the efficacy of this plan of eliminating tuberculosis from herds of cattle.

Clipping the Horse.

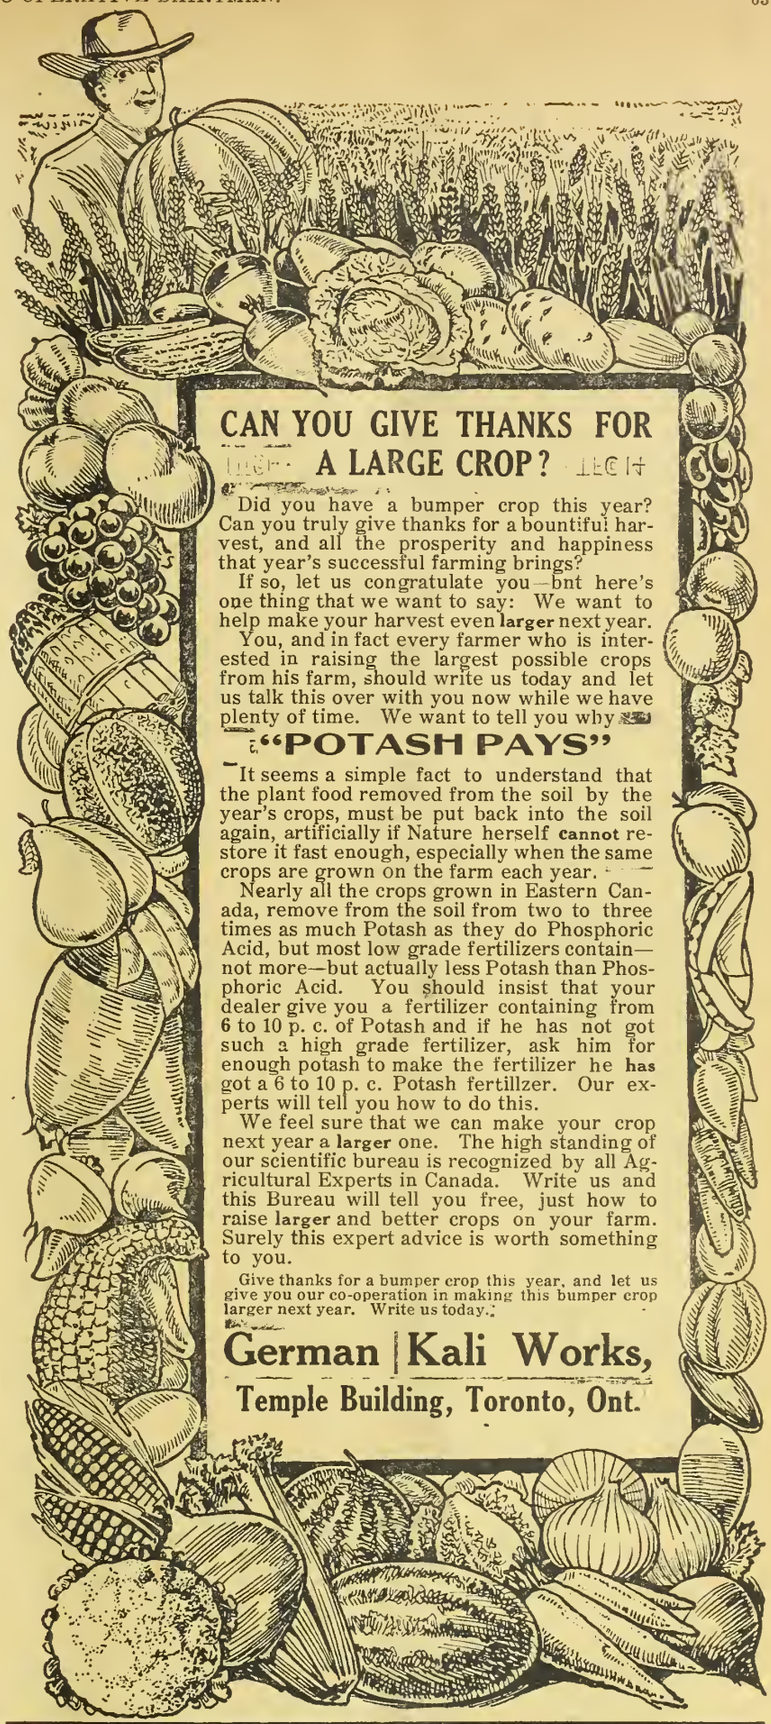
The subject of clipping the horse is a matter of considerable discussion at this time of the year. The following suggestions may be of benefit to those who are contemplating clipping their horses. In the first place, never clip a horse that has a fine coat of hair, as it will then be necessary to clip it every fall and spring thereafter, writes C. H. Barnes of the Colorado College. The only horses that should be clipped are those with heavy coats, that can be cared for during the winter, such as blanketing warmly in the stable and covering with a canvas sheet during severe storms while at work. The advantage in clipping a horse is that the long-haired horse, after sweating profusely, will not dry off during the night. This condition will cause the horse to take cold, the inflammation being located in the nose, throat, or lungs. It would not be a good policy to clip a horse and then turn it out to a straw pile for the winter. Clipped horses should never be allowed to stand uncovered, as they chill quickly. A clipped horse dries off readily, mud is easily removed from the legs, and there is no disagreeable hair flying during the period of shedding. In the fall clip as soon as the flies do not bite the animal, while in the spring, clip before the horse begins to shed.

Clydesdales for Canada.

Under the above caption a recent issue of the Scottish Farmer says:—

"The Letitia, which sailed a week ago, had on board a superior selection of big, useful Clydesdales stallions of approved merit and reputation as stock-getters. They were purchased from Messrs. A. & W. Montgomery, Kirkcudbright. Mr. R. A. Snowball, Chatham, N. B., had a remarkably well-bred two-year-old colt, bred at Harviestoun, and got by the champion sire Baron's Pride (9122), out of Minnehaha (1 756), a granddaughter of the celebrated champion mare Sunray, which in the later eighties and the earlier nineties was one of the greatest show mares of her time. The sire of Minnehaha was the world-famed champion Hiawatha (10067), and her dam was Merry Sunshine (13953), by the Prince of Wales horse Queen's Own (7176). This colt is bred for weight, size, and quality. His breeding is the most fashionable combination of recent years, and he is likely to prove a valuable sire."

The incessant drain on a sow that is sickening to a litter of pigs sharpens her appetite amazingly and she will need liberal feeding.



CAN YOU GIVE THANKS FOR A LARGE CROP?

Did you have a bumper crop this year? Can you truly give thanks for a bountiful harvest, and all the prosperity and happiness that year's successful farming brings?

If so, let us congratulate you—but here's one thing that we want to say: We want to help make your harvest even **larger** next year.

You, and in fact every farmer who is interested in raising the largest possible crops from his farm, should write us today and let us talk this over with you now while we have plenty of time. We want to tell you why

"POTASH PAYS"

It seems a simple fact to understand that the plant food removed from the soil by the year's crops, must be put back into the soil again, artificially if Nature herself **cannot** restore it fast enough, especially when the same crops are grown on the farm each year.

Nearly all the crops grown in Eastern Canada, remove from the soil from two to three times as much Potash as they do Phosphoric Acid, but most low grade fertilizers contain—not more—but actually less Potash than Phosphoric Acid. You should insist that your dealer give you a fertilizer containing from 6 to 10 p. c. of Potash and if he has not got such a high grade fertilizer, ask him for enough potash to make the fertilizer he **has** got a 6 to 10 p. c. Potash fertillzer. Our experts will tell you how to do this.

We feel sure that we can make your crop next year a **larger** one. The high standing of our scientific bureau is recognized by all Agricultural Experts in Canada. Write us and this Bureau will tell you free, just how to raise **larger** and better crops on your farm. Surely this expert advice is worth something to you.

Give thanks for a bumper crop this year, and let us give you our co-operation in making this bumper crop larger next year. Write us today.

"ORANGE LILY SAVED MY LIFE"

These words or expressions having the same meaning are contained in hundreds of the letters I have received during the past year. Many were from women who had suffered agonies from falling of womb; others from women who had escaped dangerous surgical operations, as the tumors and ulcers had been removed by the action of Orange Lily; and others who had suffered from suppressed menstruation, leucorrhoea, painful periods, etc. For all these and the other troubles known in general as Women's Disorders, Orange Lily furnishes a positive scientific, never-failing cure. It is applied direct to the suffering organs, and its operation is certain and beneficial. As a trial actually proves its merit, I hereby offer to send, absolutely free, a box worth 35c., sufficient for ten days' treatment, to every suffering woman who will write for it. Enclose 3 stamps, MRS. FRANCES E. CURRAH, Windsor, Ont.

For Sale By Leading Druggists Everywhere

Was Subject to Hot Flushes,

PALPITATION OF THE HEART, SHORTNESS OF BREATH.

Mrs. J. Carrol, Mount View, Ont., writes:—"I am an elderly woman now, and about two years ago I became faint, was subject to hot flushes, palpitation of the heart and shortness of breath. I went to a doctor but seemed to remain the same, until one of my neighbors recommended Milburn's Heart and Nerve Pills. I gladly followed the advice, and am to-day a strong, robust woman, and I thank Milburn's Heart and Nerve Pills for my present state of health, and have recommended them to all who I have learned of suffering from heart trouble."

Price 50 cents per box or 3 boxes for $1.25 at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

The 1913 Maritime Winter Fair.

The price lists of the Maritime Winter Fair are now in the hands of the stock breeders.

The dates on which the Fair will be held are December 8th to 11th inclusive. Col. H. Montgomery Campbell, the President, and F. L. Fuller, the Secretary—Manager are still at the helm and associated with them on the managing committees are the foremost agriculturists of the Maritime Provinces. Entries for the Fair close on November 20th. The Winter Fair is the most educational event in the series of fall fairs and exhibitions. Plan to make an exhibit in one or more of its departments and be present with your progressive fellow citizens on December 8th to 11th.

HIGHEST PRICES PAID FOR LIVESTOCK FED ON

MOLASSINE MEAL

Made in England

ROYAL WARRANT

After supplying the Royal Stables for several years, His Majesty King George V has granted a Royal Warrant to the makers of MOLASSINE MEAL

FINE TRIBUTE FROM MESSRS. PENNISTON:

Molassine Co. Ltd.
402 Beard of Trade Bldg.
Montreal, Que.

Dear Sirs—We have been feeding your "MOLASSINE MEAL" since last September to our Milch Cows and we must say that after feeding your Meal about three weeks the flow of milk was increased and also the quality, and all during the Winter and Spring months the yield was uniform.

At our recent sale, held a short time ago, we received the very highest price for our stock and contribute it to our regular feeding of your Meal.

Yours truly. (Signed) PENNISTON BROS.

No one can doubt that it pays to feed "MOLASSINE MEAL" after reading the above testimonial. Therefore, why not have the same results? Begin to feed your live-stock to-day and enjoy the same high prices.

Look for this Trade Mark

on every bag.

"MOLASSINE MEAL" is put up in bags containing 100 lbs. Ask your Dealer for it or write directly.

High Quality Builds Big Telephone Business

THIS business was organized to manufacture telephone equipment for independent local and municipal systems. Right from the start our equipment made records for efficiency. It did not take long for our goods to acquire a reputation for quality and reliability. As a result our business has grown by leaps and bounds.

It is a well known fact that we have been securing over 80 per cent. of the new telephone business in Ontario. The business, too, has been secured with less effort than business secured by competitors. The satisfaction our telephones and equipment have given under all conditions has paved the way for easy business getting.

To judge how fast our business is growing, yov'll remember we stated in a previous announcement that our business last year doubled that of the year before. Well, this year the first two months' sales total more than twice the 1912 sales for the same period. More and more is it being recognized by those in the local telephone business, that we are the legitimate people to deal with. There are those in the local telephone business who are interestsd in depreciating the success of the independent telephone movements and the development of municipal systems. On the other hand, our business lies wholly and directly with the independent systems and it is to our own best interests to look after these systems well, as on their success depends the growth of our business.

If you would like a list of the large independent telephone systems built in Ontario during the last twelve months, just drop us a line. We would be glad to send you a list of the systems, with the make of telephones they are using. In fact, if you'll name over the large independent systems built during the last year in Western, Northern and Eastern Ontario you'll find that nine out of every ten, are using our telephones and equipment.

You are absolutely safe in equipping your system with our telephones. We guarantee them as regards material and workmanship. In fact we guarantee all our equipment and materials. And in addition, we offer to send our telephones for **Free Trial**, so you can test and compare them with others right on your own lines before risking a dollar.

Ask for our No. 3 Bulletin—containing the latest information about building telephone lines—also No. 4, describing our magneto telephones is free on request.

"Also manufacturing agents for the Magnaphane Co., under Mr. George R. Webb's Canadian Patents No. 123363, No. 124537, No. 131145."

Uses for Sawdust.

(Continued from page 57.)

pressed into a cylindrical tube where it is cut into short lengths by a revolving knife, emerging in the form of small round briquets. These briquets are clean to handle, easy to kindle, and leave very little ash.

In England sugar is manufactured on a commercial scale by treating sawdust in closed retorts with weak sulphurous acid under high pressure. In Austin, Texas, also a plant is being built to manufacture stock food from sawdust, by a somewhat similar process. The tar, pitch and turpentine are removed from the sawdust leaving only sugar and fibre to which is added forty per cent of cottonseed meal. The mixture is sold for fattening cattle.

Two and one-half parts of clean sawdust mixed with two parts sand and one part cement make a warm long-wearing and sound-proof floor, to which carpets can be tacked with less injury than to a board floor, and which has the advantage over a cement floor in being more elastic. These qualities should win an extensive use for this form of flooring, which has the additional advantage that it can be stained to harmonize with interior finishings by the addition of color to the mixture while in a semi-liquid state.

The sawdust of certain kinds of wood is used in considerable quantities by manufacturers for metal polish, for packing, for meat curing, for making safety explosives, and composition novelties, and for fibre and pulp manufacture. Patent cleaning powders for use on carpets and rugs consist principally of sawdust, lightly moistened by some cheap mineral oil.

New Method Moth Control.

How to rid the country of the tent caterpillar and brown-tail moths is a problem. I have a method that has been tried for two years and works to perfection. It should be put in operation and it will surprise all who try it. Here is the way:

Take a large washtub and get it three-fourths full of water. Set tub outdoors away from all lights. Take a lantern and hang over tub so the bottom of lantern will come within 1 inchof the water. Have lantern near center of tub. Light it and let burn with a small blaze. Start the light as soon as dusk. Add to the water one-fourth cup of coal oil.

In the morning you will have in trap from 100 to 500 millers, which are the source of the next year's crop of tent caterpillars and brown-tail moths. I started my trap July 2. First catch was 150 with an increase each night. On the morning of July 7 I had over 700 and the catch will increase as the cocoons hatch. Try it and you will be convinced. No one is too poor to put out a trap. If all will do this the country and world will be rid of these pests in a few years.

Mr. Joslyn is on the right track. This summer Auburn and Lewiston, Me., were the centers of similar experiments, conducted by several leading entomologists of New England. Their traps were suspended below the strong arc lights of the cities. The device used was large, round, shallow pans of sheet iron with edges turned in at top. These were nearly filled with water. The moths attracted by the light above the trap fell in and in attempting to crawl out were stopped by the turned over edge. They fell back again, wings became wet and they sank. Females sank more quickly than the males. No poisonous substance or compound was used about the trap. It is believed that had every arc lamp in Auburn alone been supplied with these traps the catch of moths would have been upward of 25 millions this season.

The night of July 21, 35 traps were in operation in Auburn. From those were taken about 100 quarts brown-tail moths. Of course, according to the estimate based upon the count made by Prof. Woods, of the experiment station, fully 40 per cent. were fmales.

But this was not all. Another night over 45 quarts, or as it is estimated, nearly 900,000 codling moths were caught in the traps. This was probably the third flight this year of the codling moth. These moths are very small, and judging from the count of the number of brown-tails per quart they will run from 15,000 to 20,000 to the quart. The United States department of agriculture estimates the annual damage by the codling moth at $12,000,000.

The Maine experiments rather discount the heretofore accepted statement of the New York station at Cornell that only 4 to 5 per cent of moths trapped by light would be females. Of course, the latter, carrying the millions of eggs, are what moth exterminators wish to get. Who will say that this simple, inexpensive method may not lead to the goal which millions of dollars in appropriations have failed to reach? If effective, it will be much satisfaction to Mr. Joslyn to realice he solved the problem many months in advance of trained entomologists. Incidentally, it indicates what keen observers there are among our farmer folks. N. E. Homestead.

J. W. Copeland, of Dayton, Ohio, purchased a bottle of Chamberlain's Cough Remedy for his boy who had a cold, and before the bottle was all used the boy's cold was gone. Is that not better than to pay a five dollar doctor's bill? For sale by all dealers

Regularity

of the bowels is an absolute necessity for good health. Unless the waste matter from the food which collects there is got rid of at least once a day, it decays and poisons the whole body, causing biliousness, indigestion and sick headaches. Salts and other harsh mineral purgatives irritate the delicate lining of the bowels. Dr. Morse's Indian Root Pills—entirely vegetable—regulate the bowels effectively without weakening, sickening or griping. Use

Scrub and Pure Bred.

Said the scrub-cow to the high-bred cow,
"Say, you are an easy mark, I vow.
You eat no more than a scrub like me
You're treated no better that I can see,
Yet you give the farmer three times as much
In payment for board and room and such;
Three times the milk, and it's better too:
I'd hate to be such a fool as you."

Said the high-bred cow to the scrub-bred cow,
"I'd like to shirk, but I don't know how;
I'm not intending to pay so well,
And why I do I cannot tell;
I reckon it isn't for me to say;
I guess I was simply born that way;
No matter how hard to stop I try.
I keep on boosting the milk supply."

Said the scrub-bred cow to the high-bred cow,
"You're up against it, I allow;
You're padding the farmer's increment,
While I'm not making the dub a cent.
I know this much—if I were he,
I'd banish all scrawny cows like me,
Who eat as much as their betters can
And bunco their board from the farmer man.
"But I'm not the farmer, and so I'm here,
Eating my head off year by year.
And I'll do it as long as I can, I vow,"
Said the scrub-bred cow to the high-bred cow.

FLORICULTURE.

Paeonies

One of the chief points in favor of the Paeonie is its hardness in the severest climate. The plants require no protection. They have a vigorous habit of healthy growth. After planting they require no further care and each succeeding year adds to their size and beauty. The foliage is rich and glossy and of a beautiful deep green color—thus making the plants highly ornamental even when they are not in flower. The Paeonia can be planted either singly on the lawn or it can be used to excellent advantage to plant as a border line between lots. A large bed makes a most magnificent appearance. The Paeonia is the flower of many colors and a selection of sorts will give continuous bloom from May to July and in every shade of color, from pure white to dark purplish crimson. We have a large and fine line to select from.

Paeonia Mountain (Tree Paeonia)—Flowers of enormous size; color, a rosy pink, very effective.

Fringe Leaf Paeonia (Paeonia Tenuifolia)—A remarkable and striking beautiful variety with delicate fern-like foliage and double scarlet crimson flowers, very brilliant and satiny, perfectly hardy.

One of the many Roses that have bloomed in abundance in my garden is the Paul Neyron—Flowers of immense size. This is one of the finest roses grown and one of the finest color, deep, shining rose; very fresh and pretty. It is a strong grower, and is a remarkably free bloomer. Mine bloomed the last of July, having eight or ten big blooms on young bushes, two feet high, with long stems from new sprouts, starting from the ground, as well as the side branches. Near the middle of September, they are loaded again with beautiful buds.

It will soon be time to plant all hardy shrubs, for spring blooming, and get your Tulips and bulbs ready to be planted the last of October and first of November.

Hyderangea Paniculata Grandiflora is a shrub I would recommend for fall blooming. It begins blooming the last of August and lasts all through September as it takes a heavy frost to kill it. Both my tree Hyderangeas and the low shrubby variety are a sight of bloom. They are hardy in our climate and one of the free bloomers. They can be transplanted as well in the fall as in the spring, and all the protection they need is a little manure placed on the top of the ground in the fall.

O. A., St. John, writes:—I want to get a lot of Hyacinths this fall as I did last year. Will you tell me what the matter was with two of those I had last year? They grew splendidly at first, the blooms came on all of them, but seemed to stop on these two at half grown. The foliage grew on as high as fourteen inches and most of the blooms have wilted and died about half grown. I am afraid the bulbs were old. How do you grow new bulbs?

If the bulbs were forced last season they would be apt to produce stunted and deformed bulbs and the foliage would grow as described. We never force Hyacinths more than one season, but get new bulbs from Holland every fall. You can get new fresh bulbs that will bloom well from your florist next October and you had better throw the old bulbs out. They do not pay to bother with. We have all the forcing bulbs—Tulips, Hyacinths, Crocus, Narcissus and Daffodils at the Sussex greenhouses arriving the last of September and October. Nothing is prettier than a few bulbs for home in winter or for a bed in early spring.

Tulips are so tough and hardy and will bloom long before anything else and last so long are only 35 or 40 cants a hozen.

Primrose, Hampton, writes:—Is the Lavender colored Primrose with the round leaf poison to touch or only to eat. If poison to touch what would it do and is there any remedy? I have a fine plant that is a most satisfactory bloomer and I hate to throw it away. I have had it for a year and was just told that it was poison and not safe to handle. What had I better do with it?

The Primula Obconica is poisonous to some people but it is rather a rare case to find any one that is seriously affected. However, there are some in St. John even, that are affected by a mere touch, but such is uncommon. I would certainly not put it near my mouth. I have handled thousands, and sold as many and have never seen a case of poisoning. If it has not bothered you in the past year I would think you were quite safe in keeping the plant, as it is certainly a beautiful house plant and there are such a lot of beautiful colors in that line and with a little care will bloom the year round. A little baking soda water will heal all the itching in a short time.

During the month of October and the first of November, all bulbs intended for winter and spring forcing should be potted or boxed. The earlier this is done the better for results obtained as the bulbs, if kept in the air later have a tendency to grow up and throw imperfect flower stocks. White Roman Hyacinths and Paper White Narcissus, if potted or boxed then, can be had in bloom at Christmas. For Hyacinths and Narcissus, use 4 or 5 inch pots, according to the size of bulb, even with the soil will do, but never use soil containing any fermenting material, for bulbs, if any fertilizer is used, it should be old, well-rotted manure, and more than one quarter to three-quarters soil have the pots thoroughly drained. Tulips need a four inch pot. Freesias can be grown in any size pot, Place the bulbs two inches apart in the soil. Harresii, (Easter Lilies) and other Lilies need six or seven inch pots, for each large bulb. Plant these so an inch of soil will be over top of the bulb.

If you use boxes let them be shallow; three inches of soil is enough. Bore holes in bottom of boxes and cover them with drainage material. After bulbs are potted or boxed, water thoroughly and place them away in a coold, dark position free from frosts to form roots. Let them remain until the soil in pots or boxes is matted with roots, then they can be brought to the light for forcing. Give sun and air and keep moderately moist. The great secret of successful forcing for spring blooming bulbs is having them thoroughly rooted before top growth is established this being their natural method of growing in the open ground.

The Chinese Sacred Lily can be forced into bloom in from six to seven weeks in ordinary house temperature if grown in water and sand or gravel and is fine for Christmas bloom. It usually takes from seven to eight weeks for Hyacinths and Narcissus to become well matted with roots. Freesias and other small bulbs can be grown without placing away to form roots, but are better by being kept cool and dark for a time before forcing. Crocus and Scillas can be easily forced, but need a cool temperature to do their best are fine for outdoor beds for bordering.

Nothing is finer for spring blooming than Tulips, Crocus, Scillas as they will last so long.

FOR SALE - Yorkshire boar one year old, in splendid breeding condition and gets good stock. Forty-five dollars at barn. BOYD A. WETMORE Bloomfield Station, N. B.

Big Ben

To wake up on the installment plan

Big Ben gets you up *on the installment plan*, a little at a time, by ringing every other half minute for ten minutes, so you'll wake up *gradually*. Or he'll do the whole job all at once, with one long, straight, five-minute ring.

You can set him to do it as you choose, and *shut him off short* in the middle of his call either way.

That makes him *two good clocks in one*, to suit everybody's taste in early rising.

He plays no pranks. He won't go off before it's time and rob you of your full measure of sleep. He won't go off behind time and rob you of your work time. It's Big Ben's business to run on time, to ring on time and stay on time.

Big Ben attends to his own business and helps you attend to yours by getting you and the farm hands out early.

Then he sticks around the house and keeps time all day for the women folks so they can have your meals on time.

There never was a clock that fitted in better with farm work.

He's triple-nickel plated and so handsome you'll want to keep him in the parlor instead of a bedroom.

Stands seven inches tall from the top of his head to the tip of his toes; has big, easy-winding keys, large hands, and big figures that you can read at a distance on dark mornings, and is built of good implement steel so he'll last for years. He's doing this kind of work in 3,000,000 American homes today.

Six thousand Canadian dealers sell him—his price is $3.00 anywhere. A community of clock-makers stand back of him. Their imprint, "Made in La Salle, Illinois, U. S. A., by Westclox," is the best alarm-clock insurance you can buy.

Gas Engine Troubles.

One mistake commonly made by the beginner is to use too much gasoline and lubricating oil, says F. Webster Brady, in The Country Gentleman. The tendency of the older operators is to use too little lubricant. The first indication of these excesses is a smoky and ill-smelling exhaust. Perfect combustion gives an almost odorless and colorless exhaust. Excess of lubricant or a poor quality will change a perfect combustion exhaust to a foul one, giving a blue, yellow or whitish smoke. With too much fuel the smoke is black and bitter.

INTERNAL TROUBLES.

But the smoke nuisance is a trifle as comapred with the internal troubles that follow the waste of fuel and lubricant. A clean cylinder, valves, and sparking points or contacts with a smooth and free working piston, are prime necessities in successful gas-engine operation. The overfeeding produces hard and gritty deposits of carbon, which increase the piston friction, score the surfaces, prevent the valves' seating tightly, and foul the spark-plugs or the make-and-break contacts. The carbon is incombustible, but on any high spots it will become highly heated by the compression, which will sometimes fire the charge before the piston gets to the end of the stroke. This "chucking" of the engine by premature explosions has resulted in bent connecting rods, split guide barrels, and other serious damages.

If a hot tube igniter is used the fouling of the tube prevents any fresh charge from entering the heated tube, and misfires will result. With the make-and-break igniter the wiping action of the contacts scrapes them clean to some extent and the spark is kept operative. This spark systen is a specially good one where there are any carbon troubles. The jump spark systems however, can be knocked out completely by carbon deposits, as they short-circuit the spark-plugs or cause leakage enough to weaken the spark below its strength to fire the charge.

The only remedy for carbon deposits—those already made—is to open the cylinder and scrape off the carbon. As this is neither a pleasant nor an easy task, therefore try to avoid the necessity of it. A kernel of prevention will save you a bushel of trouble.

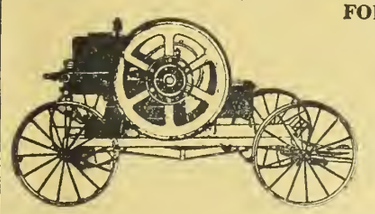
However, it is best to clean the spark-plugs frequently. Have two or three extras on hand and in good order to replace defective ones instantly. A spark-plug short-circuited from dampness can be restored by baking it in a hot oven or by heating over a clear gas flame. This refers particularly to plugs having mica insulation. One time I saw three men spend a whole day trying to get a gas engine started before they discovered that the trouble was due to the dampness in the spark-plug. And then they purchased a new plug because they did not know that the other could be restored to usefulness.

EVERY OIL HAS ITS PLACE.

In case too little lubricant is used the symptoms show in the groaning and halting action of the engine, caused by its overheating and loss of power. Sometimes the piston become stuck from lack of lubricant. A dry and scored cylinder allows the gas to blow through, and the escape of the smoke as seen about the connecting rod gives a warning of the internal condition. In one case I found that the engine would not run with a load.

For the bearings get a reliable oil or grease—not the lowest-priced, but standard goods for high-grade bearings. This is not the stuff, of course, that is so generally used on cultivators, mowers, and so forth. Some farmers don't seem to appreciate the need of shed protection and the use of grease, oil and paint for their farm machinery, and hence they are liable to slight their gas engines. An oil that runs off too fast and one that gums are both undesirable, because either overheated and melted bearings or stuck shafts will probably result. The lady who used hair oil on her sewing machine had good intentions, but the shaft stuck so fast that a powerful grip on the fly-wheel could not turn it, and it took me over two hours to wash the bearings with gasoline and put the machine in order. Examine the shaft bearings and the crank-pin of your engine frequently. Test their temperatures by touching them, and see that the oil flows freely and steadily. A grease-cup makes a very handy lubricating device. Keep the bearings sheltered from dust and grit If a bearing gets hot flood it with oil, and if possible take off the load for a while. As soon as practicable, remove the cap and clean the shaft and bearing thoroughly, taking special care to see that the oil holes and channels are open. Scrape off any burnt Babbitt metal and burnt lubricant that may be adhering to the shaft. Gasoline makes a good wash for cleaning bearings and shafts.

FOR YOUR FARM, YOUR HOME, YOUR FACTORY
FOR EVERY POWER PURPOSE, A



GILSON
"GOES-LIKE-SIXTY"
ENGINE
MORE VALUE, MORE POWER, MORE SERVICE, MORE SATISFACTION

Does satisfaction mean anything to you? Does money saved in fuel, in time, in repairs and expense bills appeal to you? Get Gilson Facts, and find out how the Gilson 60-SPEED engine does the greatest variety of work—how it gives the maximum satisfaction—saves money in equipment, and yields 100% service at lowest cost. Every engine covered by a cast-iron guarantee.

NEW FEATURES AND LATEST IMPROVEMENTS

The new Gilson 100% SERVICE ENGINES, 4 H P and upwards, are equipped with our new friction clutch pulley with five interchangeable rims, each of a different diameter. Change to the proper speed for every job in a few minutes. A NEW and EXCLUSIVE GILSON FEATURE. These engines are also equippen with a magneto, without batteries or coil, with spark retarder,—no cranking necessary. A child can start them.

We also make 60-SPEED engines in 1½ and 3 H P sizes. These are mounted on truck, with line shaft and five interchangeable pulleys, and pump-jack. Drop us a card to-day, and we will send you full descriptive literature. We are making special prices to the first purchaser of one of these engines in every locality. Write NOW.

Few Great Pianos

Most Piano makers will tell you that their instruments are the **best** made. Some of them **think** so: Others **merely say** so. But as a cold, business proposition there are only a **few really great** pianos manufactured —**and their hidden parts are identical**—and the

Sherlock - Manning 20th Century Piano

is recognized as one of them. Herc is another remarkable fact: A competitor **originated** our slogan. After **studying** our instruments he declared: The Sherlock-Manning is

"Canada's Biggest Piano Value"

You cannot buy a **better** piano than the **Sherlock-Manning** pay what price you will, and when you **do** buy a **Sherlock-Manning** you can **rest assured** that your instrument is

--one of the **few great pianos** made
—that it is **unrivalled in brilliancy of tone**

—that it is **built to endure**, and YOU **save $100**, by our **different** and **better** way of doing business.

Don't you think that it would **pay** you well to **consider** our proofs of these claims? Write today for our handsome **Art Catalogue.** And the proofs!

Volume 19. SUSSEX, NEW BRUNSWICK, NOVEMBER 11, 1913. Number 3.

Autumn and Winter Feeding of Dairy Cows.

By J. H. Grisdale, B. Agr., Director Dominion Experimental Farms.

COWS are fed in the stable during one half of the year or more, and feeding during this period may through ignorance or on account of using unsuitable forage, voluntarily, or involuntarily, be made very expensive. The profits from the herd will of course depend to a large extent on the economy of the methods of winter feeding followed. Economical feeding does not mean scant supplies, but the using of the kinds of feeds and feed combinations that will be likely to produce the best results at the lowest cost.

As the milk produced depends upon the quantity and quality of the food consumed, every effort should be made to supply the cow with all she will eat of a ration combining palatability, easy digestibility, and suitability in composition for the milk flow.

Observation and experimental work here during the past twelve or thirteen years lead the writer to consider succulence, variety, and regularity in hours of feeding as the most important factors making for palatability and high digestibility of a ration.

SUCCULENCE INCREASED PALATIBILITY.

By succulence is meant juiciness or a high percentage of water in the feed. Giving an abundant supply of water for use along with a dry feed will not have the same effect as causing the cow to take the water as a part of her food. To illustrate:—100 lbs. of fresh pasture grass may include as much as 85 lbs. or more of water and only 15 lbs. or less of dry matter. This 100 lbs. of pasture grass fed green is, however, as proven by experiment, worth considerably more than the same 15 lbs. dry matter fed in the shape of 15 lbs. dry grass and the cow allowed to drink all she will of water along with the dry grass. Further, the cow will take considerably more of almost any kind of dry matter, and digest it more readily and more completely when fed as a succulent than when fed as a dry food.

Succulence in the winter ration may be secured in several ways. The most common, and the most advantageous from the standpoints of low cost of ration and convenience of handling, is the use of ensilage. Roots of various kinds are however largely used and are very valuable for the purpose. Where both the above are lacking, succulence may be secured by cutting the straw or hay and sprinkling freely with water a few hours or even a couple of days before feeding. Adding about 20 per cent. of feed molasses to the water used for sprinkling improves the palatibility and effectiveness of such a ration very greatly. Where ensilage is available, it is well to mix from 8 to 12 lbs. chaff with each 100 lbs. ensilage. This should be done some little time before feeding to insure the chaff being moistened.

VARIETY INCREASES PALATABILITY.

Variety in the ration fed the dairy cow adds greatly to its effectiveness by rendering it more palatible. Variety in this connection, however, must not be taken to mean feeding one kind of feed to-day, a different feed or combination of feeds to-morrow and still another ration the next day. Variety in feeding the dairy cow must be secured by combining in the ration, which should be the same or practically the same from day to day, as many different kinds of roughage and meals or concentrates as it is found convenient or possible to include. Feeding a meal mixture made up of oats, barley, bran, oil-cake meal and corn is likely to give better results than a meal mixture of similar feeding value from a chemical standpoint including, say, only bran and barley and much better results than feeding bran alone. The mixture of meals improves the flavor thus rendering the meal more palatable and hence more digestible. Palatability in a ration adds greatly to digestibility. Improved digestibility means increased effectiveness. The value of variety in the feed is thus apparent.

These remarks must not be taken to mean, however, that a mixture of roughages or a meal mixture once compounded, no other may be fed. It is possible to have two or three quite different mixtures on the go at the same time, provided always that the same feed be fed at the same hour each day. That is, one might feed ensilage, straw and meal in the morning, and roots, straw, hay and bran in the evening or vice versa. It will not do, however, to feed ensilage in the morning one day and in the evening of the next. It or any other feed should always be fed at the same hour.

SOME IMPORTANT MINOR AIDS TO PALATABILITY.

The stage at which the various forage crops are harvested has much to do with their flavor and aroma. Early-cut hay is not only superior in composition to the late-cut article, but is much more pleasant in aroma same may be said of most forage and more acceptable in flavour. The same may be said of most forage crops, the early-rut, well-cured forage plant of practically every description is much superior to the late-cut badly-cured plant of the same species.s, the early-cut, well-cured forage

Freshly-ground grain is always more palatable than long-ground material and will give better results.

Feed the best feeds, that is, the most palatable feeds, in the morning. Give less acceptable feeds at night or outside in racks or in some such way as will leave the eating of the same a matter of amusement or a pastime, as it were, rather than a duty or a necessity. The cow eats such things best when she really does not need to eat them and, what is more, shows results for the extra feed consumed even though it be inferior in quality.

HOW OFTEN TO FEED.

Some feeders claim it to be necessary to feed several times each day. A common practice is to feed morning, noon and night. A satisfactory method as tried here have been to feed as follows: Succulent roughage mixture and meal mixture first thing in the morning, hay after that is cleaned up. This is repeated for the ensilage and meal mixture about 3 p. m. The hay is fed after the cows are all milked about 5.30 p. m.

Experiments standing over some years to determine the relative merits of dividing the ration into two or into three or more portions seemed to indicate that when the same amount of the same kinds of feed was fed in two portions it gave just as good results as when fed in three or more portions.

REGULARITY IN FEEDING.

A certain hour should be chosen as the time to feed each portion and that hour should be adhered to most strictly. Any temporary variation is sure to result in a falling off in milk. Anything likely to irritate the cow or render her uneasy is almost certain to injuriously affect the milk flow.

WATER.

The requirements of the milch cow in the way of water are very considerable. The more milk produced and the more feed consumed, the greater is likely to be the amount of water required. This amount may vary from, say, 75 pounds up to even 300 pounds water in a single 24-hour period. The problems of how to water, when to water and how much water to give, can best be solved by allowing the cow free access to water at all times. The water had better be warmed in winter, but, if it is not convenient to store it in a warm place, it will not pay to warm it artificially.

The individual drinking fountain is probably the best method, but the trough filled periodically and washed out frequently has many advocates. The using of the manger for watering purposes after feeding is practised in some stables, but our experience would lead us to condemn the system as troublesome and less satisfactory from the standpoint of comfort to the animals than the individual bucket. But of one thing care should be taken, no matter what the system adopted, that is, to keep the cups or troughs of water supply clean and sweet.

SALT.

Salt is necessary to the comfort and health of the dairy cow. The quantity to feed will vary from an ounce to three or four ounces a day. It might, as in the case of the calf, be given in the form of rock salt in the manger, but had better be fed daily in the food. It adds to the palatability of a food, hence is valuable as an appetizer, as a food and as a stomachic.

EXERCISE.

Exercise when taken by the dairy cow is not immediately conducive to milk production. On the contrary, anything that might be called exertion is practically certain to lower the milk flow temporarily. It would, however, be unwise to say that the dairy cow should have no exercise while producing milk. It is probable that the allowing of a moderate amount of exercise will have a beneficial effect upon the health of the animal and al-

most certain that such exercise will advantageously affect the offspring. Turning the cow out in cold winter weather, however, to shiver, if only for half an hour a day, in the winter winds, is likely to prove anything but healthful to the cow, economical to the farmer or advantageous to the breeder.

A Minature Demonstration Hay Farm.

Editor Maritime Farmer;

About fifteen miles from St. John is a small pot of dry side-hill hungry land—gravelly loam—clear of building grounds and roads, scarcely two acres in extent, most of which has not been plowed in thirty years; whose owner's business is other than farming.

This land has been brought up in condition by it present owner, from a very low impoverished state of former years, to a first class hay-growing lot.

The improvement has been made by topdressing with manure from the stock on the place, usually a cow and horse. No manures purchased excepting commercial fertilizer for a small patch of potatoes in the kitchen-garden corner.

Of late years the yield of hay must have averaged three tons or more per acre, mixed grasses, couch predominant, but an excellent standard of hay.

The topdressing is done, as much as practical, immediately after haying, but also some in the spring.

What amount of hay is now cut on the lot may be judged from the fact that about two tons of it are sold or disposed of yearly, besides feeding a cow through the winter, as well as at times of slack pasture during the summer and a horse all the year round.—W., Kings Co., N. B.

Forests and Rainfall

It is commonly thought that the moisture which forms clouds and falls as rain is almost entirely evaporation from the ocean, but scientific investigations show that seven-ninths of the rain which falls over land areas is supplied by evaporation over such areas, the ocean supplying only two-ninths of such precipitation. Dr. Raphael Zon, one of the foremost investigators in America, states that 'the forest evaporates more water than any vegetable cover and much more than free vegetable surfaces.' In fact, it has been estimated by Dr. Fernow, of the University of Toronto Faculty of Forestry, that 75 per cent of the rain-fall over forested areas is returned to the atmosphere as watery vapour, which does much to increase the amount of moisture carried by air currents passing over the forests.

In Canada, the prevailing winds blow from the west and the provinces of Alberta and Saskatchewan are largely dependent for their rain-fall on air-currents which come over the Rocky Mountains. It is a well known fact that winds passing over high mountains became cooled to such an extent that they lose most of their moisture, which falls in the form of rain, and hence the land areas for many miles to the leeward of such mountains receive so little rain-fall that they are often arid. But if the leeward slopes of these mountains are covered with forests, as is the case in the Rocky Mountains, these forests will evaporate and render again available a large amount of the rain-fall over these mountains, which might otherwise pass off through underground channels, and by reloading with moisture the winds blowing over the prairies, such forests make possible a much greater rain-fall than might otherwise occur. Should the east slope of the Rocky Mountains become denuded of tree-growth, it is likely that much larger areas in Alberta and Saskatchewan would be arid than is now the case.

This is but one of the many reasons why the Dominion Government are preserving the forests on the east slope of the Rockies by the creation of a forest reserve now nearly 21,000 square miles in extent.—Forestry Branch Dep. of the Interior Canada.

Judging by the excessive quantities of rain that fell recently tnere can be nothing wrong with the avaporating machinery of our Maritime forests.—Ed. Note.

We Need Parcel Post.

For the past few years farmer's conventions in Canada have passed resolutions calling upon the Federal Government to extend the scope of the post office service to carry parcels of a reasonable size at a fair charge. From time to time we have had reports that the present postmaster-general will institute such a service, and such news is always most welcome. There are, however, powerful interests opposed to the extension of the parcels post service, and these will use their influence to have the present arrangements continued. In face of such opposition the individual usually feels helpless, but as a matter of fact by writing to his member and by using the influence of the organizations to which he belongs he may bring so much pseasure to bear that the end will be reached in a short time. It should be insisted, in fact, that the necessary legislation be passed next winter.

In the United States the post office has been carrying parcels of eleven pouds for some mdnths now, and so satisfactory has been the service that it has been extended to carry parcels up to twenty pounds. This permits of economically marketing eggs, butter and other farm produce in a fresh condition direct from producer to consumer, and breaks the monopoly of the express companies in the parcels carrying business. In such a rational matter as making the fullest possible use of the government machinery Canada should not lag behind any of her neighbors.

There is a prospect of the parcels post service being inaugurated in Canada early in the year.

Storing Seed.

The curing and storing of seeds is a matter of vital importance because of its influence on the germinating quality. Seed should be thoroughly ventilated in the process of curing or they will mould and sprout, either of which seriously injures their value. Seeds of some kinds will sprout several times before entirely losing their germinating capacity, but they lose much of their vitality by once sprouting. Moulded seeds may sometimes retain their vitality unimpaired, but if they be offered for sale their dark color is objectionable, for it must be always regarded as an evidence of neglect in curing. It is also essential to prevent seeds, especially tropical seeds, such as melons, corn, cucumfully dry. The freezing of green or half cured seed injures its vitality bers and tomatoes from freezing until and often destroys it.

Seeds are much influenced by the temperature and humidity of the place in which they are kept. A dry place is absolutely necessary for keeping garden seeds successfully, and if warm, so much the better for the tropical seeds. The temperature and condition of a good living room are almost ideal for storing all kinds of garden seeds. Most, if not all our garden seeds are unimpaired by even severe freezing, while perfectly dry. In a moist place, they lose their germinating qualities quickly.

The Root Cellar.

The root cellar needs ventilation in order to prevent mold and decay. In cold climates is not feasible to admit outside air direct to the cellar because it would be too cold in winter; the result would be a lot of frozen roots. The air must enter the root cellar either through the barn or through a conduit built below frost line so that the temperature of the air will be modified in passing through. There should be a shaft in the ceiling, opening above the barn or building in which the cellar is located, just the same as the ventilating shaft in a King system of barn ventilation.

The underground conduit spoken of may be made of 8-inch glazed tile laid below frost line and should extend from fifty to a hundred feet in this position so that the air may get warmed up by the warmer soil before it reaches the entrance of the cellar. The opening into the outside air may be a vertical shaft to the desired depth below frost and then continue in a horizontal direction under the cellar opening into the floor. If the cellar is large the tile should run the full length of the cellar with two or three openings. All openings both inside and outside should be covered with a wire screen strong enough and fine enough to keep out all small rodents and the like. The tile should be drained at its lowest point to take care of any water that may condense in its interior.

Such an arrangement w ll help to keep the cellar cool in summer.

Measuring Hay in Stack.

For obtaining the number of tons of hay in a stack, the first step is to measure the width and length with a tape line, and then what is known as the overthrow, that is, pass a tape line from the bottom of the stack on one side to the bottom of the stack on the other side, and divide this measurement which is called the overthrow by three, then multiply the length by the width, and this by one-third of the operthrow—this gives you the number of cubic feet in the stack. Of course, if the stack is different widths or different heights you will have to take the measurements in several places and obtain the average of these by adding them together and dividing by the number of measurements made.

The number of cubic feet of hay per ton varies considerably with the length of time that it has been stacked. With newly stacked hay it will take about 500 cubic feet to equal a ton. If it has been stacked for two to three months, from 350 to 408 cubic feet will equal a ton. After you have obtained the number of cubic feet in the stack, divide by the number of cubic feet in a ton, taking into consideration the length of time that the hay has been stacked.

Maple Sugar Adulteration.

To the Editor, The Maritime Farmer.

In a recent official declaration, the Chief Chemist of the Dominion stated that out of 128 samples of Maple Sugar analyzed by his department, 45 were found to be adulterated, and he gave his opinion that he saw no reason why the mixing of white sugar or spruy with the pure article should be prevented. In Government Bulletin 258 he also says that it is a palatable article and no ground for complaint can be found for its appearance on the market.

This statement coming from a Government official is strongly to be deprecated. The Chief Chemist may say that oleomargine is a palatable article and that no ground for complaint can be found for irs appearance on the market with far better reasons to back up the attitude, but nevertheless there are very severe and stringent laws on the statute book dealing with its sale or manufacture in Canada. There are wheels within wheels in this Pure Food Legislation Game. On one side are the manufacturers able and ready to jump into the market with a "new article" or a substitute so like the original in appearance and flavor that it is very difficult to detect any difference without careful analysis. On the other side are the farmers with their natural food stuffs and the "name" of those natural food stuffs have through centuries of use become associated with them so that they have acquired a selling value. The farmer is entitled to the "names" of his plants, fruit, vegetables and produce from inherent right he should not have to copyright the word "turnip" ever although a manufacturer could make and sell an article so like it that the purchasing public could not tell the difference.

Now, while the manufacturer has got to make a living as well as anybody else, so has the farmer. Here's a case in point, if any citizen chose, he could sit down to a meal of 'near' bread made from potatoes and bran, oleomargarine and "maple" flavored glucose instead of wheat bread, butter and Maple Syrup. The first articles are substitutes more or less, they imitate, and imitation is the sincerest form of flattery. They really sell because the real articles made the demand and were first on the market. As long too, however, as they market themselves under their own names and openly and fairly put their claims before the consumer under distinct 'names' it is really the affair of the consumer who buys them. It is open and square selling. There is no attempt to sneak in under the name or guise of the real article. While the sale of oleomargarine hurts the butter trade to a certain extent, as long as it is sold as oleomargarine, not as butter, there is no fraud practised on the consumer.

But can this be said of maple substitutes. There are none of them that do not offer themselves for sale under the guise of the word "maple" in some shape or form. It is the word 'maple' that sells the goods. They may not have the smallest percentage of maple in their composition they may be a compound of birch bark, hickory and glucose, but nevertheless theywant to be sold as maple, maple flavor, and other names containing the word maple. The word "maple is wanted on the label more or less prominent. Why? The reason is obvious tne consumer wants maple, he does not want hickory or birch or glucose, he wants maple.

There is going to be some stiff fighting when the Canadian farmer wakes up to tne true aspect of the case. Here is a great Canadian natural product. The maple will be identified for all time with Canada. From the standpoint of patriotism alone, the produce of the maple tree should be as pure as the most stringent government regulations with properly enforced penalties can make it. Many farmers are cutting down their trees and depleting their groves, the sale of substitutes has grown so enormously. Another result is that the consumer to-day is sceptical even when buying the purest goods. A bad state of affairs surely. We have very keen laws about grading our fruit and other products, shipping them to for-

eign countries for fear any injury is done Canadian trade by getting our goods a bad name. It would be a calamitous thing for the good name of Canada to suffer in the markets of the world. In what position does the maple product stand in this respect?

The argument advanced that the farmer does not make enough pure goods to meet the demand would be legitimate enough if the full resources of the maple supply were tapped, but as a matter of fact there are thousands and thousands of groves lying idle, and that too with a price of $1.25 per gallon for Maple Syrup being paid by the consumer. The real fact of course is, if there were less adulteration and selling under the cover of the word "maple" there would be more of the genuine article produced, and many a farmer would have a little gold mine in his maple grove, but when improper, half-hearted legislation allows the adulterated and cheaper articles to compete with the genuine, under more or less misleading labels the former gives it up as a bad job and the industry naturally suffers in consequence. The more adulterated syrup is sold, the less of the pure will be sold.

Another argument is that a lot of stuff made by the farmer is so poor that it has to be mixed up, clarified, and of course adulterated to make it saleable at all. This is a handy sort of an argument, but when it is examined it won't hold water. The farmer makes the poor stuff for the simple reason that the adulterator is ready to take his course flavored, burnt syrup and sugar and tone off the flavor with glucose or cane syrup. Would the Government encourage the farmer to make rank butter so that the manufacturer could doctor it up to make it palatable, and put it on the market with the word "butter" in the forefront. Yet to be consistent the Chief Chemist's opinions should be along these lines.

Let us keep this great natural product as pure as possible, teach the farmer to make as high a grade as possible, and we shall be educating the farmer upward instead of downward. It is a good Government that makes its' laws to educate upward instead of downward.

JOS. LEFEBRE,
Secretary Pure Maple Syrup and Sugar Co-operative Agricultural Society.

Feeding Cabbage.

When there is an unprofitable market for cabbages in the fall or spring a desirable way to dispose of them is by feeding them to the stock. Cabbage is a succulent feed, highly relished by cows and is an excellent milk producer. It is rich in protein.

The only objection to feeding cabbage to milch cows is the flavor imparted to the milk. When fed under certain conditions this, however, can be avoided, so that the milk will have just as desirable a flavor as when cabbage is not fed. If one can keep from tainting the milk, butter also will be free from a high flavored cabbage taste.

One of the first precautions to observe is to keep cabbage away from the stable at milking time. Milk absorbs an odor quickly, and if cabbage odors are near the milk, it will be tainted. If cabbage is in the barn while the milking is being done, the milk is apt to be tainted, whether or not the cows eat the cabbage.

Another precaution to observe is not to feed the cows any just before milking time. If they are fed cabbage or for that matter any high flavored feed, such as turnips, an hour or two before milking, a taint will be imparted to the milk.

The best way when cows can be let out in the pasture is to give them the cabbage there. While this causes more or less fighting among the stock, it is the best way to keep from having cabbage tainted milk or butter. This also should be done several hours previous to milking time. When cabbage is to be fed in the stable, the quantity to be fed should be brought in each day and by no means stored in the barn. A desirable way to do this is to do the feeding at the noon hour, or each morning and evening after the milking has been done.

Cabbage should be fed in rather limited quantities. It is best to begin with a rather limited quantity at first and gradually increase the allowance from day to day as the stock gets used to the feed. One bushel at a feed can be given safely when the cabbage is fed twice a day. The cabbage should be reasonably clean and free from rot. The precautions to observe in feeding cabbage to milch cows, of course, do not apply in feeding to young stock. It is an excellent feed for them and should be profitably utilized for this purpose.

Thorough aeration and cooling of the milk immediately after milking will help to remove not only the cabbage odors, but all other taints to which milk is subject. The milk should not be left sitting around in pails or cans, but taken to the milk house at once, carefully strained and run over the cooler.

Even where there is a sale of cabbage, there generally is quite a lot of waste in the trimmings and bursted or soft, unsalable heads. While this stuff may be spread on the land, it makes a cheap, profitable feed and can be made to answer both purposes by first feeding to stock. In the fall it is a wise plan to gather the stalks from the field for feed after the cabbage has been cut. In the spring when the market is dull, a total loss can be avoided by feeding to stock.—L. H. Haynes, of Pennsylvania, in Hoard's Dairyman.

Soil-Potash

To what extent is the stock of natural potash in the soil available for plant nourishment? This is a very difficult question to answer. In a clay soil there is almost always a large quantity of the constituent, but is a sufficient proportion of it in a condition soluble enough to be absorbed by the growing crop? Sometimes the addition of potash salts to such soils has been found to produce profitable results, at other times the outlay would appear to have been useless. On sandy and chalky soil, it may be taken as an axiom that, in the absence of liberal dressings of farmyard manure, it is essential to apply potash. Some useful experiments have been made to test the proportion of solubility of the potash present naturally in different kinds of soil. A crop of rye grass was sown for three consecutive years in six different kinds of soil. The soils were first carefully analysed for potash, and at the end of the third year, the soil was again carefully tested for the constituent. Of the stock originally in the soils, it was found that the crops had absorbed the following percentages:—

Soil	1st Year	2nd Year	3rd Year	T'tl.
Sandy, rich in humus	48.7	7.0	10.3	66.
Sandy	44.2	6.3	4.7	55.2
Sandy loam	42.9	10.5	3.6	57.
Loam	24.2	4.5	4.1	32.9
Clay	12.5	4.0	2.2	18.7

From these results it would appear that the solubility of the soil potash in different kinds of soil is very different. It is greatest in soil of a light character naturally deficient in potash, and in which, therefore, the natural supply is quickly exhausted. Hence such soils are much benefited ash salts. In the heavy soils, containing a much greater natural supply, it is much less available, and often is not sufficiently soluble to supply the needs of the crop. In such cases additional supplies produce good results. It is never safe to assume that there is naturally in the soil a sufficient supply of available potash. Trials should be made to rest it.

Rotation vs Disease

The accumulation of noxious weeds, diseases, and insects on the farm, is one of the most serious sources of loss. This results as a rule from the constant growth or too long continued culture of the same crop or class of crops on the same land. Wilt in various crops, bacterial diseases, grain rusts, and weeds and insects too numerous to mention all accumulate in the soil under the one-crop system.

These pests often multiply to such an extent that ultimately it becomes impossible to secure profitable returns from land thus infested. Resistant varieties must then be secured or be avoided and the fertility of the crops cultivated on land not subject to these pests. All these troubles can soil greatly improved by intelligent systems of rotation. The most profitable systems for any locality or type of farming, so far as they have been developed, can usually be obtained from the nearest Experimental Stations.

Fruit Trees, Spraying Materials and Utensils at Cost

The Association continues to do good work for the fruit growers and is creating a steady interest and increase in co-operative effort. During 1912 and 191 the Association supplied its members with nearly 30,000 fruit trees, most of which were sold at 22c, 23c, 24c, and 25c per tree, and also with several thousand small fruits. The nurseries in New Brunswick and Nova Scotia have been supplied by the Association with scions and buds taken from good bearing trees of the varieties most in demand in the provinces and consequently the supply of Maritime grown trees of the best varieties true to name available for planting in New Brunswick in the spring of 1914, is practically twice as large as three years ago. As the bulk of the trees placed throughout the province annually by agents are sold at prices ranging from 30c to 45c and even to 50c per tree, it is easy to see that the Association is saving its members hundreds of dollars in the purchase of their fruit trees. By ordering nursery stock in large quantities, the Association gets the very best the nurseryman has to offer and gets it at wholesale or the lowest possible price, as the agent's commission and expenses are omitted. In a similar manner, a large quantity of spraying materials consisting of lime-sulphur and lead arsenate were purchased from Nova Scotia by the Association and distributed to its members at cost price. Other supplies such as pruning tools and packing appliances and materials, etc., are secured at cost price on request.

For full information and annual reports, write to: The Secretary, New Brunswick Fruit Growers' Association, Fredericton.

New Dairy for Pictou County

A new Dairy Company has been organized in Pictou County for the purpose of carrying on a dairy and creamery business among the farmers along the main line of the I. C. R. between Truro and Mulgrave, also the Sunny Brae and Pictou branches. This company also proposes to deal in feeds, agricultural implements, fertilizers, etc., which they will sell to the farmers in car lots at wholesale prices, thus saving the middleman's charges. It also proposes to sell for the farmer anything he may have for sale such as potatoes, grain etc. The head office and plant is located in Stellarton and the company has just let the contract for the erection of a factory 25x75 with an ell, engine and boiler room, 18x23, to be built of brick veneer roof covered with steel shingles. As this is purely a Farmers' Co-operative Joint Stock Company, the company is not selling any of the stock in the town, although they are receiving inquiries for the same almost daily in amounts ranging from $100. to $5,000.00.

—M—

Sheep Sorrel

Sheep sorrel grows most abundantly in thin or worn out meadows. Breaking the meadow and raising corn or some other cultivated crop will usually subdue the weed. The land should be enriched with barnyard manure before re-seeding to grass, and an effort should be made to secure a thick stand. On meadows or pastures that cannot be plowed, top dressing with manure and sowing additional grass seed will be beneficial. The addition of lime to the soil is also said to aid in thickening the grass and crowding out the sorrel.—Andrew B oss, University Farm, St. Paul, Minn.

Big Attendance in Agricultural College

Truro, Nov. 4.—The Provincial Agricultural College opened on Nov. 4th for the regular winter course, with an enrollment of upward of eighty.

Of these a few have come from Prince Edward Island, and quite a number from New. Brunswick. All the Counties of Nova Scotia are represented, siff coming from Cape Breton.

This attendance will be augmented within a few days, and the College course class to number over one hundred.

Education Needed for Farming

While, of course, there is much the farmer can learn only by experience, there are many things essential to his success that the mere performance of the necessary farm operations will not teach him. Spreading manure will never teach him that stable manure should be supplemented with phosphoric acid to get the best results. The growing of clover will not teach him that mineral fertilizer may keep up the fertility of the soil where clover grows luxuriantly and occurs in the rotation at definite intervals. Feeding cattle will not teach him that a good ration for milk cows is one containing one pound of digestible protein to seven pounds of digestible carbohydrates, provided it it palatable and at least two-thirds of the total ration is digestible. Nor will the feeding of such a ration teach the farmer how to calculate the most economical ration from feeding stuffs at current prices.—Thomas F. Hunt.

The boy's appetite is often the source of amazement. If you would have such an appetite take Chamberlain's Pablets. They not only create a healthy appetite, but strengthen the stomach and enable it to do its work naturally. For sale by all dealers.

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

RETURNS PLANT FOOD.

Only a comparatively small proportion of the mill feed is actually utilized by the cow. Practically all of its plant food may be returned to the soil if it is properly conserved. Herein rests a very important factor in the operation of the dairy.

AN IMPORTANT ITEM.

Available plant food upon a dairy farm is an important item. It means a much larger production of various farm crops and a consequent increased value of the farm. In older farmed sections where land has been unwisely robbed of its fertility the purchase of concentrated feed is often made with a view to its value in restoring the land.

A MARITIME PUBLICITY ASSOCIATION.

"Resolved that this gathering here assembled form ourselves into an organization to be known as the Maritime Publicity Association, the object of this Association to be the publishing and advertising at home and abroad of the resources and opportunities of the Maritime Provinces."

Following the passing of the foregoing resolution by a representative gathering of Maritime publicity men recently in Moncton the following officers were appointed:—President, C. L. Martin, Amherst, N. S.; Vice-President, for P. E. Island, J. E. B. McCready; Vice-President for New Brunswick, Henry T. Hoggs; Secretary, Edgar E. Kelly.

The general plan is to inaugurate a central bureau to supplement the publicity work already being carried on, this is a mutual co-operative way. A fund will be raised by direct appeal to the towns and cities of the Provinces and to the Federal and Local Governments, the railways, etc. It it proposed to place a competent publicity man in charge of the work, a man thoroughly in touch with Maritime affairs and conditions.

The Maritime Provinces have never received advertising commensurate with their resources and it is the aim and object of the new Association to proclaim upon the housetops and byways and highways of the world the various attractive features of Maritime Canada.

INCREASING THE SUPPLY OF LAND.

Some time ago Mr. W. M. Lea, of Prince Edward Island, writing in the columns of the Maritime Farmer on the question of intensive cultivation pointed to the fact that although Prince Edward Farmers and those of the other provinces as well could not increase their farm holdings in point of acerage they could increase their farms by following a judicious system of intensive cultivation and a well planned rotation harvest many times the amount they do at present from their farms. The following abstract from Conservation is to the point.

"Is the amount of land in the world a fixed "quantity? 'How absurd!' one may be tempted "to exclaim. 'Of course you may dyke here and "drain there, and turn a little stretch of water "into land, but what does that amount to? For "all practical purposes, certainly the amount of "land in the world is fixed.'

"But it is precisely for practical purposes "that it is not fixed. Thirty years ago vast "areas in Western Canada for all the good they "were, might as well have been on another plan-"et, simply because there were no means of "bringing to a market the crops, which they "were capable of producing. The development of "transportation facilities has made these lands "accessible and has thus, for practical purposes, "increased the supply of land in the world.

"Land, i. e. available land, can, however, be "increased in other ways. We cannot perform "miracles and add to its area, but it is impor-"tant to remember that area is not the only "quality we regard in considering the worth of "land. Though an acre is a measure of surface, "we assuredly do not think merely of its length "and breadth, without regard to its thickness, i. "e. the depth of soil. If, by deep cultivation, we "bring untouched layers into use, we have again, "for practical purposes, increased the supply of "land.

"Moreover, we cannot think of the value of "land in terms of its quantity merely, without "regard to its quality. When we purchase a "farm we acquire not simply a volume of soil "with a certain cubic content, but soil posses-"sing certain valuable physical and chemical "properties. If we deyned accurately what we "mean by the 'land' we are buying, we should "certainly include these properties, and their im-"pairment through poor methods of tillage is a "direct loss of the commodity we have paid good "money for. On the other hand, we may in-"crease its amount by intensive cultivation, "which, again, is another and most important "way of augmenting, for practical purposes, the "supply of land."

TILE DRAINAGE AND EARLY VARIETIES OF SEED.

The necessity for a more genuine use of tile drains and the sowing of the earlier varieties of grain was very forcibly brought home to the farmers of many sections of the Maritime Provinces this year.

The prolonged periods of damp, dark weather was not conducive to the early maturing and ripening of grain, particularly of the late varieties. Hundreds of bushels of grain were badly damaged in the making on some farms while some of the neighboring farmers had their straw stored and grain threshed several weeks before.

Why such a variation of dates of ripening on two adjoining farms? On the one farm where there is good natural drainage or where an efficient system has been tried, the land is what is commonly called in every day parlance "early." As soon as the frost is out of the ground in the spring it warms up readily and it may be worked even immediately after a heavy shower of rain. Vegatation comes on very rapidly in this land and grain getting an early start has ample time to grow and ripen during the hot sunny weather of July and August. On this kind of land a late variety of grain will ripen ahead of an early variety growing on colder, damper soil. If an early variety of grain is grown on this well drained soil it will ripen and be ready to cut early in August. On the other hand the farm that is badly drained remains clammy and cold and cannot be worked to advantage should a showery season prevail previous to and during seeding time. The seeding is late, vegetation is late and consequently unless there should chance to be an abundance of hot sunny weather the ripening will be so late that the straw will have to be cut green or run the risk of getting it damaged with rain or frost. If a late variety of grain is sown in this "late" soil so much later will the harvesting season be.

If obliged to sow grain in "late" soil next spring strive to have a sufficient quantity of early grain for seeding purposes and ere you are obliged to again til the field plan to have that particular lot of land underdrained, then the seed may be sown earlier than it can be now, and then the water will not lodge on the surface of the land as it does now. Then the growth of the grain will be unimpeded, and then the harvest will not be late.

MAKING THE LIVE STOCK COMFORTABLE.

Jack Frost's little nips these nights should be a reminder that the long cold winter is again with us. What have you done or what are you going to do before the steady cold weather arrives to make your live stock as cosy and comfortable as possible during the season when they must of necessity be confined for hours, days or perhaps weeks at a time?

Are your stables well lighted? If not, are you going to rest contented while your stock is, as it were, in a dungeon where dirt and disease germs breed and multiply directly to the detriment of your stock's health and indirectly to the impairment of your own and your family's good health. If you are at all handy with tools the expense of putting a few extra window panes where they will admit the most light into your stables will be nominal. Don't put off a matter of this kind. Get at the job some mild day and you will be delighted with the transformation. Are the stable windows so covered with dust and cobwebs that they will hardly admit any light. Take a lesson from the good housewife in window washing and apply yourself and the lesson learned to cleaning the stable windows.

Are there chincks in the walls that admit the cold winds to circulate beneath the floors? A few minutes work with pieces of board, hammer and nails or with stone and mortar or some other material will fill the openings so that the cold will be excluded.

What about bedding? If you have a sufficient quantity of straw or swale hay to do for bedding, you can spend a day very profitably before the snow flies gathering and storing the fallen leaves in your wood lot, or it may be that you can get all the sawdust you require at a neighboring mill, for the hauling.

Are the floors rough or uneven? Punch the nails or spikes and smooth off the lumps with axe or adze and if a plank is badly worn or decayed take it out and replace it with a new one.

Plan to have your stables properly ventilated; but do not ventilate by means of direct drafts.

Having made your live stock comfortable outwardly do not neglect to feed and water regularly. We are firm believers in having water within reach of stock at all times. A system of that kind will pay for its instalment many times in the course of a few years. You have often seen a cow turned out to water on a cold, stormy day, return with a rush to the stables without taking more than a sip or two when she would be so thirsty that she would drink several gallons if offered to her a few minutes after returning to her stall. Have you ever considered the torture that such a cow would undergo before watering time next day unless given some water in the meantime?

What applies to one line of stock in the foregoing applies to all classes of farm stock. The good stockman will always be careful to see that his stock is as comfortable as he can make them. Some of the things we have mentioned are only trifles; but it is the small things that count in the race for success.

Look for motives before you condemn the acts of your neighbors; if motives are good, overlook faults.

* * * *

The only sure way to keep out of trouble is never to get into it.

* * * *

A close observer is usually a good farmer. The student of nature often makes a successful cultivator of the soil. Plant producers, like animal raisers, should study their plants and learn how to treat the soil to benefit the most.

Women's Institutes in Nova Scotia.

No one in Nova Scotia can conscientiously deny that the Farmer's Association have been of immense benefit to the farms of the Province. Aided by the Department of Agriculture, no effort has been spared to obtain the best methods in all kinds of farm work and that those efforts have been successful is readily demonstrated by the improved farms and the larger yields. Better methods mean in every line of life better results.

There is no gain saying the importance of the work of the farmer, but the work of the farmer's wife is equally important, and while only a favored few can follow the profession of farming, what a tremendous following the profession of the farmer's wife can boast. Perhaps the profession of the farmer's wife covers more outdoor work, but there is not a house in Nova Scotia in which some woman does not follow the best profession of all—that of homemaking.

The woman in the home has been allowed to ge) along on any little tap ends of imformation she could gather from newspapers and home journals— many of the articles none too reliable. No organized effort was made in her behalf. The home could be comfortable or uncomfortable according as the ability employed, or interest taken in the task permitted. Any work done outside the home as poultry raising, fruit and flower growing, bee keeping could be done in anv primitive style desired unless she could gather some information from a meeting of the Farmer's Association, in which those subjects had been taken up. The highest standards in farming are only reached through education, and it is a simple deduction that the highest standards of home life can only be gained by education.

It is an oft quoted saying that "the farm feeds the teeming millions," but the home goes one step farther, and produces the people, who go to make up the teeming millions. In Nova Scotia, our homes produce only a small unit of the millions but it behooves us to see that the standards of these homes are as high as education can raise them.

Just how or in what way that education could best be afforded the homemakers, was a problem that presented itself to a few ladies in the rural districts of Ontario, some fifteen years ago. Improved methods were being imparted to their husbands, fathers and brothers, through the various avenues of learning, leading from the Department of Agriculture. Why not have any information that interested them about the farm and additional, having more direct reference to home life, brought directly to them? To that end they asked the Department of Agriculture to organize a few institutes for women in the interests of homemaking and housekeeping, and those portions of agricultural pursuits more readily suited to women.

With rather a dubious forecast as to its ultimate success the Department acceded to the request, and gave permission for the formation of a few women's institutes. From those few institutes has sprung that huge organization, which to-day numbers in Ontario alone some eight hundred branches with a membership of over twenty-five thousand.

From Ontario the movement has spread westward to the Pacific Coast and eastward to Nova Scotia, achieving a fine growth in Quebec and New Brunswick and just starting to grow this past summer in Prince Edward Island and Nova Scotia. Eight institutes were organized in July in Pictou, Colchester and Cumberland counties, and the reports received from these institutes since their inauguration have been most encouraging.

At the present time meetings are being held in Hants, Kings and Annapolis counties and while some districts are rather conservative in their reception of the institute, others take it up readily recognizing the good that must follow. To many, the idea is such a new one that the aim of the movement is not fully understood. Others dislike taking up a new idea unless they feel assured of its success. Others urge lack of time and the present overplus of work. As a usual thing it is found that the busiest woman who is readiest to take up an new idea and carry it to success because as a rule she has more time for the simple reason that she understands how to value and make the most of each move ment. When "lack of time" is urged as an excuse, it is very often the lack of energy to put the time at one's disposal to its best use. If more women recognized the good to be gained by change of occupation and atmosphere and an exchange of ideas with a group of women, there would be healthier women and happier homes as a consequence.

The work of making an institute a success should not be minimized but is anything worth while that can be gained without an effort? The mere fact of working to attain an object makes that object double dear and gives that glow of satisfaction that comes from successful effort. The slightest effort to attain meets its attendant satisfaction, how much greater satisfaction where the effort is greater? In joining an institute they join with the idea of helping to the best of your ability. Out of your experience you may bring the very ideas that are needed most and will do the most good. No woman knows so much that she cannot learn more, and no woman knows so little that she cannot help in some way.

While the institute deals principally with the home or rather the home causes first with the institute, there are many things done for the community. The motto is "For Home and Country" and it would be a poor homemaker, indeed, who could but do some work for the community outside the home. Homemaking does not only include house-keeping and cooking. Good house-keeping and good cooking are necessary adjuncts of every home, but many good housekeepers and many excellent cooks have not even the first idea of the rudiments of homemaking. A good homemaker does not only see that the conditions in the home are the best for the growth, development and happiness of the inmates of the home, but one sees to it that conditions in the community are fresh and wholesome. That is the art of homemaking in the highest development and to render assistance to that development is the aim of the Woman's Institute.

It is not to a few women here and there, then, that the institute should appeal, but to every woman, for than all else the welfare of the hone and its inmates. While the growth may be slow, it will be sure and steady and as its object becomes understood and appreciated its membership will increase and its beneficial results will be felt.—Miss Jennie A. Fraser, Supt. Women's Institute for Nova Scotia.

Recommendations of Forester Re Brush Disposal.

The following is a summary of the conclusions reached in report to the Commission of Conservation by Clyde Leavitt,, Forester to the Commission. The conclusions apply to conditions in Canada the results of an investigation into the brush disposal situation in the Adirondack region of New York, where conditions are closely similiar to those in a large portion of Eastern Canada. The conclusions are as follows:

1. Increasing stumpage values render fire prevention and control essential from the point of view of the timber owner. Decreased in wood supplies render it still more essential from the point of view of the general public, and, in particular, of the communities and business interests directly dependent upon the manufacture of forest products.

2. Logging slash constitutes the most serious fire menace in existance.

3. Brush disposal is a practicable and feasible method of minimizing fire danger, though secondary to pa. trol.

4. The method of brush disposal to be adopted in any particular case can be determined only by careful consideration of all the surrounding conditions. It is desirable that the adminstrative officers have a reasonable degree of discretionary authority.

5. Where brush-burning is practicable both financially and silviculturally, this is tht most efficient means of reducing the slash menace.

6. Where brush burning is not practicable for any reason, the lopping of tops may be advisable. In case tops are lopped, financial and silvicultural considerations will determine whether the material should be piled or scattered or left without further attention. The necessity for lopping may under some circumstances be obviated by some other fire-protective measure, such as the construction of firelines, etc.

7. The lopping of tops does materially increase the amount of debris which reaches the ground or forms piles resting on the ground in sufficiently compact form to absorb and return moisture; the time required for decay is thus lessened by one half to two thirds. The slash menace as an element of fire danger disappears in direct proportion to the rapidity and completeness of this process of decay. Piling or scattering, following lopping, is desirable, but is generally considered to be impracticable in the Adirondacks on account of expense. This would apply also to a large section of Eastern Canada, under a Government license, and allowance is made for the added cost in the dues to be paid.

8. With closer utilization, the relative efficiency of top-lopping as a fire protective measure decreases. In other words, lopping is much more necessary in an old-time lumbering operation and will have a greater relative effect in decreasing the fire danger, than in the case of a pulp operation, where a far larger percentage of the branches will in anv event be brought into contact with the ground, as a necessary part of the operation.

9. The beneficial effects of top-lopping far outweigh the disadvantages due to any possible injury to soil, reproduction or old growth.

10. Lopping to only a 3-inch diameter limit in the top materially decreases the cost of the operation. The law has recently been changed to require lopping only to a 3-inch diameter limit. This is a result of the report of the State Forester, following the field investigation of last fall. The general consensus of opinion is that the average cost of lopping under the original law was approximately 15 cents per cord for pulpwood or 30 cents per cord for saw timber. Under the law as it now exists, the cost should be very materially less than this.

11. The question of brush disposal and of fire prevention in general should be given much more careful attention in Canada by all concerned than has been the case in the past. This is entirely practicable in the case of issuance of new licenses by Dominion or Provincial Governments, as well as in the case of renewals of existing licenses.

12. Patrol is the most important and the most essential element in any plan of fire protection. This must be provided, regardless of what other methods are adopted. The construction of roads; trails, telephones, look out stations, and other permanent improvements of a similiar character is essential to an efficient patrol system.

Storing Potatoes.

In storing potatoes two main factors must be considered, temperature and ventilation. The storage cellar should not be warmer than 33 degrees if possible. Of course, it may go a few degrees above this and make very little difference in the final results, but if there is any thought whatever of any danger of freezing, a thermometer should be placed in the cellar and a very careful watch kept of the mercury. Do not be afraid to burn a little kerosene in an oil heater if there is any danger of the temperature going below freezing. This may save many dollars' worth of potatoes.

Be sure to make a thorough provision for ventilation. It is absolutely necessary that the warm air be carried out and that the cool air be carried in when potatoes are first placed in the storage cellar. If the cellar under the house is to be used for storage, it is best to have the potatoes perfectly dry and clean when put in. If potatoes for the family use alone are stored, they can usually be placed in one bin.

Early Maturity.

Editor Maritime Farmer:—

In the Maritime Farmer of September 30th, there appeared a short article under the heading "Early Maturity," signed by one Alfred McPherson, River Dennis, N. S., in which the writer claimed to have the youngest cow on record. I can tell him that his cow is eclipsed for early maturity by a heifer owned by R. H. Smith, Hilden, Colchester Co., N. S. The heifer dropped a calf when about two weeks over twelve months. The writer himself has one if bred whe she first came in would be a cow before she was fifteen months.—H. C., Truro, N. S.

Early Maturity.

Editor Maritime Farmer:—

I noticed an article in your columns in which a Mr. McPherson, River Dennis, N. S., gives an instance of early maturity in his herd. I have a heifer that was calved on the first of May, 1912, that dropped her first calf on July tenth, 1913. She therefore became a cow when fourteen months and ten days old. She three-quarter Holstein blood.—C. E. Foley, Wilmot, P. E. I.

"It is a pleasure to tell you that Chamberlain's Cough Remedy is the best cough medicine I have ever used," writes Mrs. Hugh Campbell, of Lavonia, Ga. "I have used it with all my children and the results have been highly satisfactory." For sale by all dealers.

HORTICULTURE.

Fertilizing Apple Orchards.

The experiments have shown that the fertility needs of an orchard may be the most important check on production. Variations in fertilization alone have resulted in average differences ranging from 50 to 460 bushels an acre annually for the past four or five years, depending on the experiment. These results were accompanied by similiar differences in the growth and general vigor of the trees.

A recent bulletin by Prof. J. P. Stewart of Pennsylvania, who so acceptably addressed the Nova Scotia Fruit Growers at Middleton last winter, indicates briefly the methods and conditions under which some of these results have been obtained. It outlines a simple method of determining whether or not similiar results can be secured in any particular orchard. It also considers the total plant food requirements of a productive orchard, and indicates the more important effects that follow the application of the various fertilizer elements.

The total plant-food draft of a mature and active orchard is greater than that of a 25-bushel crop of wheat in every important constituent except phosphorus. It is practically inevitable therefore, that sooner or later the output will be reduced or off seasons will be developed in any productive orchard because of a lack of sufficient plant food.

MINERAL REQUIREMENTS OF TREES.

The mineral requirements of wood are comparatively low. This largely accounts for the fact that young trees usually do not make a profitable response to fertilizer applications, although they frequently respond well to manure or to other methods of conserving moisture.

The relative amounts of the various food elements required by the other interest, but as a rule they are not especially reliable at bases for making fertilizer applications. The latter are best determined experimentally, as there seems to be very little relation between tne response and the total chemical requirements of the trees.

Applications of nitrogen and phosphates and also of manure have been very beneficial in the Johnston and the Brown orchards. In those orchards, potash has been of little or no service. These results are reversed at the present time in the Tyson orchard, so far as yields are concerned.

The time required for results to appear has been surprisingly short in all cases where fertilization has proved to be really needed. In such cases, both the value of fertilization and the kinds needed were clearly evident by the middle of the second season, and no material changes have occurred since.

SMALL FERTILIZERS FAIL.

Neither acid phosphate nor "floats" when applied alone, have resulted in any important benefit. We are therefore "completing" the fertlization of their plats by the addition of nitrogen and potash, in order to test further their relative values as carriers of phosphorous for trees.

Lime also has failed in most cases, though it may have some value in aiding growth. In addition, it may have some direct value in facilitating the growth of leguminous intercrops, and also in correcting a possible toxic action possessed by the basic radicals of a number of salts, some of which are present in commercial nutrients.

At present the high-grade sulphate in our experiments is showing no superiority over the muriate as a carrier of potash, but the reverse is usually true. Lower cost and easier handling therefore give the latter the preference. It is possible that the low-grade sulphate, or the 24 p.c. "double-manure salt," as it is often called commercially, may be superior on account of its magnesia content, but this has been fully demonstrated.

The influence of proper fertilization is not transient. The gains from it have been greater in the sixth and last year some of our experiments than at any time before. In one case, these gains have exceeded 1100 bushels an acre. Where the crops of the full years are not too high, the yields usually have been greatly steadied by proper fertilization.

In all our experiments the action of manure has proved to be practically identical with that of a commercial fertilizer rich in nitrogen and phosphorous. There successes and failures have coincided with but two exceptions, and in those cases moisture rather than plant food was apparently the controlling factor. The commercial nitrates and blood have acted more quickly than the manure, and the potash in the latter has apparently been less effective than that in the commercial forms.

In general, the influences that have materially increased the yields have also increased the growth. This is true generally, unless either occurrs to an abnormal extent. The phosphates seem to be a partial exception to this rule, and mild injuries also may stimulate yield at the expense of growth.

Manure and potash are the only fertilizing materials that have shown a consistent benefit on the average size of the fruit. This is doubtless associated with their favorable relations toward available moisture, which is the chief determiner of fruit size. Above a rather indefinite point, however, the size of the crop on the tree becomes the dominant influence on fruit size. Proper thinning and moisture conservation, therefore, are the most important means of improving the average size of fruit.

COLOR OF FRUIT DUE TO LIGHT.

The red colors in apples cannot be increased materially by any kind of fertilizer applications, though potash and possibly phosphates may be of some slight assistance. These colors are directly dependent upon sunlight and maturity, with the latter occurring preferably on the tree. Late picking, open pruning, light soils, sod culture and mildly injurious sprays, therefore, tend to increase the reds in fruits, while opposite conditions decrease them.

The retarding influence of nitrogenous fertilizers or manure on color makes it advisible to use them freely on some of the red varieties, especially those in which the color comes on rather tardily, such as the York Imperial. On the lighter soils, or in localities with the longer growing seasons, this precaution is less important.

In one experiment, no form of fertilization has yet shown a profitable response, and in two others such responses have come only from manure and mulches. It is evident, therefore, that the actual fertilization of a given orchard is still largely a local problem. It is possible, however, to indicate the more prominent characteristics of orchards in need of fertilization, and to formulate a general fertilizer, based on present experimental results, that nay be used in such orchards until more definite local data can be secured.

Pruning For Tree Peculiarities.

Rhode Island Greening and Roxbury Russet tend to spread and come to the ground; they may be started with an upward shoot to the branches and allowed to grow comparatively thick for the first few years; they will open up quickly enough. It is possible to grow an excellent Greening tree without any leader, provided the branches are started properly. I am inclined to leave this tree thicker than I would a Baldwib, except when it is being grown on the soil well suited to it, such as Dundirk clay loam, because under such conditions we are almost always assured of green fruit with little color, which is desired.

I have had no experience with Wealthy on light land, hut on Dunkirk clay loam it tends to grow too thick, which is an advantage because it can be corrected and the size of the fruit maintained by judicious pruning. I have particular reference to trees which are at this time almost 30 years old. Twenty Ounce seems to do very well on sandy loam soils, and on such it does not make too much wood, so that the fruit colors well. Duchess of Oldenburg bears young and naturally tends to grow open, so that comparatively little pruning is required. It seems to delight in rich, sandy loams and good loam soils.

Wageners on account of its tendency to bear early and heavily, requires little pruning until the tree begins to show decay, then I believe it can be aided by a vigorous pruning and the formation of new wood. I saw some trees which were severely pruned when they began to show signs of decay and were much benefited by it. Since the tree is short lived anyway and is nothing but a filler, it has its place.

McIntosh tends to grow open with us after it begins to bear, although the trees grow thick while they are young on the Dunkirk loam, making

Flour trial is essential but— it is not your work!

Flour varies from time to time in baking quality. This is because wheat continually varies according to soil conditions, etc.

Therefore, if baking results are to be constantly high, baking tests are essential. It is unreasonable to expect you to make these tests at your expense.

So from each shipment of wheat delivered at our mills we take a ten pound sample. This is ground into flour. Bread is baked from the flour. If this bread is high in quality and large in quantity, we use the shipment. Otherwise we sell it.

By simply asking for PURITY FLOUR bearing this name you can always be sure of more bread and better bread.

"More Bread and Better Bread" and "Better Pastry Too" 523

a wonderful amount of hood, yet I believe they will not make so much when they begin to bear. My judgment is based on trees which have been bearing 10 years, but which, unfortunately, are in sod.—In N. E. Homestead.

Combines Bees and Fruit.

Thomas S. Williams of Sturbridge, Mass., is one of those who was obliged to seek health in outdoor employment. It may be said that he has found it, and a good living as well, on his small farm. He has three separate lines of work which he finds go well together, and without conflicting. The first is the culture of small fruits. This year, though late frosts spoiled the first strawberry blossoms, he still had a fine crop. He has a half acre set to cantoloups that promise well.

For quite a number of years he has kept bees and year by year intends to increase. He began by following the wild bee, and learned much that has contributed to making him the intelligent, patient worker that he is among these insects. During the season of swarming he is never found very far from his apiary, and any unusual commotion brings him on the scene at once ready for necessary work. So interested is he in his bee colonies and so intent that no matter what else he may be doing, his friends say you can almost "hear him listen" as he looks in their direction. He not only finds bee keeping fascinating, but profitable as well.

In the late fall he devotes a couple of months to trapping the small fur-bearing animals, and says the financial returns from these compare very favorably with any other like period of the year.

All trees guaranteed free from scale, true to name, and of first class stock.

"Home Grown Trees are the Best."

Prompt attention given. Prices on application.

Protecting Your Apple Trees.

Editor Maritime Farmer:

Winter will soon be here. What is being done to protect the young apple trees during the long cold winter?

Last winter quite a lot of trees were killed by having the roots frozen. This was due to the excessive moisture in the soil and exposure to severe freezings.

Where there is no underdrainage, the surface should be ridged by running a furrow every 15 or 20 feet and rounding up between the furrows as much as possible. This will allow a good surface drainage.

Since there has been so much rain this fall the trees will be more or less weakened, consequently something should be done to prevent winter killing. Where apple trees are subject to severe exposure, a mulch of barnyard manure will serve as a good protection.

Young trees should be wrapped with building paper or wood veneering, to protect them from the ravage of mice and from sun scald. This covering is fastened quite tightly around the tree 12 to 18 inches high. A little earth is put around the bottom to prevent mice crawling under.

The first cost of the veneering is a little greater than the paper, but is easier handled, will last longer, and therefore is cheaper in the long run. It will cost about ½ cent a tree not including labor, and is good for several years.

The coverings should be left on in the spring until danger from severe frost is gone.—D. B. F.

DAIRYING.

Holding Back the Milk.

Pateley Bridge, a noted English writer on dairy subjects, writes as follows on this subject in the Farm and Home, an English agricultural Journal:

"Cows will sometimes refuse their milk to strangers, and a rough milker will often upset a herd. The reremedy in these cases is to get rid of the offending milker, for among dairy cows gentleness and kindness should always rule. If a cow evinces a dislike for one milker or a preference for another, it is best to humor her and hand her over to the care of the favored individual entirely. The superiority of women as milkers is generally admitted by all experienced cowkeepers, and the obstinate retainer of her milk will often prove tractable with a woman while obstinately refusing it to a man. Unfortunately female milkers are scarce, and year by year become more difficult to obtain.

"A common remedy is to attempt to distract the attention of the cow from her milking by providing some tempting food. The question of feeding at milking time is a debatable one, and we are familiar with the arguments against it, but nothing makes cows so much at home in the milking shed or brings them home to it so cheerfully as what the Yorkshire man calls a 'bit o' licking.' As a general rule, the relationship between cow and milker is good in dairies where feeding at milking time is in an institution. In some cases with a strange cow patience wins, and if the milker sticks to his stool and keeps rubbing the udder and stroking the teats, he will tire out the most wilful of cows. In other cases it seems a better plan to leave the cow for a time and return to her a half an hour later. In extreme cases it may be found more effective to refrain from milking until the distension begins to cause inconvenience, but there are drawbacks to this, and carried too far there may be a case of garget or a bad quarter. Putting a weight over the loins is a favorite remedy with some, and we have seen heavy chains and bags of sand, earth, or wet brewers' grains employed in this way. The idea is that the weight on the loins has an effect on the ability of the cow to control the voluntary muscles of the udder, which, under normal conditions, there is no doubt she can, but such measures are calculated to upset a nervous cow, and can never conduce to a big yield of milk. Teat tubes, or milk syphons effectually negative the cow's efforts at retention, but these are no more to be recommended, unless as a last resource, than weighting the loins. The udder is not simply a resevoir for storing milk which can be emptied by overcoming the resistance of the sphincter. Secretion goes on while milking is in progress, and is favored by the gentle stimulus of the calf's tongue and palate or the hand of the milker. Moreover, this is the richest milk. Kindness, patience and perseverance are the most rational, as they are the most successful means to overcome a disposition to 'hold' the milk."

Feed Rape After Milking.

Essex rape is a crop that is being much grown for forage purposes throughout the entire country. It is best adapted to cool, moist climates, but does exceedingly well under a wide range of conditions. The greatest growth can be expected on rich, moist, soil suitable to other farm crops. Rape is a very heavy producer and requires lots of moisture. It takes considerable nitrogen from the oil as well as mineral plant food. It can well be compared with the corn crop in this respect. It is better to follow a crop of rape with wheat or some other small grain for this reason.

In sowing rape, the ground must be plowed and a good seed bed prepared. There are several ways of growing the crop, either drill rows or broadcast, depending upon the conditions. The method commonly used is to broadcast early in the season on especially prepared land, or else it is sowed in the growing grain field. Four or five pounds to the acre is sufficient for a good stand. If conditions are at all favorable, rape will do to pasture in from 50 to 70 days after sowing; sometimes even less time than that.

Rape has a high feeding value. It has been fed to milch cows with some degree of success. It increases the milk flow remarkably, but many object to the taint it gives the milk. This trouble can be overcome by feeding the rape after milking. Where the crop is fed to hogs or sheep, they may be turned right in and allowed to pasture on it.

However, if it is fed to cattle and horses, it should be handled as a soiling crop. In a number of different places, rape is sown with other crops for forage purposes. In some cases it is sown 15 days after the oats or grain crop and makes considerable growth for pasture after the oats crop has been harvested. If the season is very favorable, with plenty of rainfall, the rape has a tendency to grow up and interfere with the harvesting of the grain crop.

Dairy thoughts.

The droppings from the cattle will benefit the pasture more if they are spread or broken with a spike tootb harrow. This prevents the grass from being killed out and weeds coming in where the droppings have lain.

The most important business of the dairyman is to increase the amount of manurial substances and apply them where they will do the most good to the growing crops.

He is no wise a public benefactor who keeps two cows to do the work of one.

A poor milker is one of the surest ways of diminishing the milk flow.

Too many dairymen are conducting their business as a side issue when they should be making it the leading feature of their farming.

The new cow has an individuality of her own and the feeder should become acquainted with her as soon as possible after she is brought into the herd.

Go you limit on a good bull. If your cows are deficient in the flow of milk, buy a sire that will make up the quality. If their milk is deficient in butter fat, breed from a sire whose tendency is to build up along that line.

Feed records are just as essential as milk records. It is the profits we want rather than the phenomenal milk yields that are made by feeding large quantities of expensive concentrates.

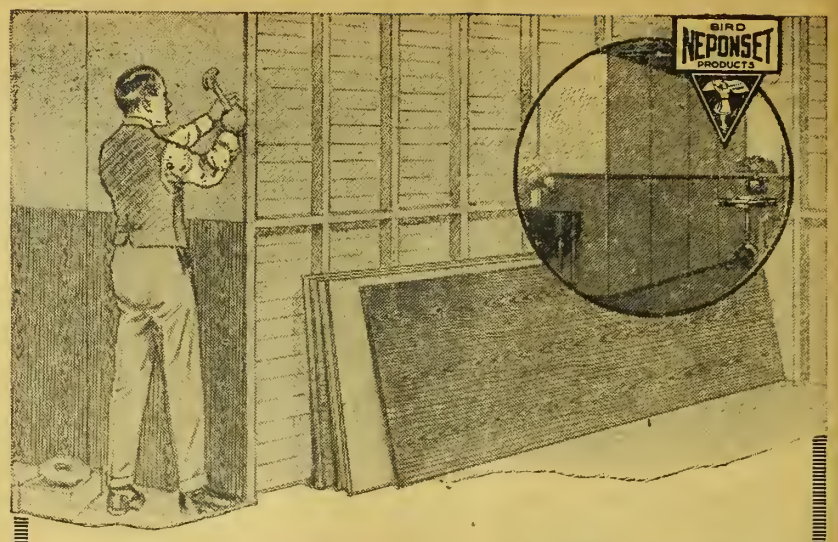
Proper feeding determines the amount of gain in the dairy business.

Milk records and feed records make knowledge definite.

If we are to make a success of the dairy business we must put thought behind and into our everyday work.

A cow will never do her best unless she has perfect confidence in you.

The modern dairy cow must be handled with understanding and her owner must have a knowledge of her wants and make every effort to supply them.



Why Use Lath and Plaster?

NEPONSET **Wall Board** costs less than lath and plaster and does away with the dirt, nuisance and delay of plastering. Just nail to studding and cover the joints with battens of same material, which we furnish.

NEPONSET **Wall Board** is a waterproofed *fibre* board which comes all ready decorated in three beautiful finishes—plain oak, cream white, and burnt leather. Makes an ideal living room—an attractive dining-room—a modern, sanitary, paneled kitchen. Requires no painting.

NEPONSET
Waterproof Building Products

Roofings

NEPONSET Roofings are a fire protection, leakproof and long lived. Anyone can lay them. NEPONSET Paroid Roofing is for general use. NEPONSET Proslate Roofing is an ornamental roofing for dwellings. Attractive colors.

Building Papers

If NEPONSET Waterproof Building Papers are built into walls and floors, the building will be warmer, will cost less to heat and will last years longer. Recommended by architects, engineers and building owners everywhere.

Wall Board

NEPONSET Wall Board is a scientific product which takes the place of lath and plaster; comes in sheets 32 inches wide. Remember, it is the only wall board with waterproof surfaces that requires no further decoration. Anyone can put it up.

Are you going to build? Write for more facts about the products in which you are interested. **Send for samples, free booklet** and name of nearest NEPONSET dealer.

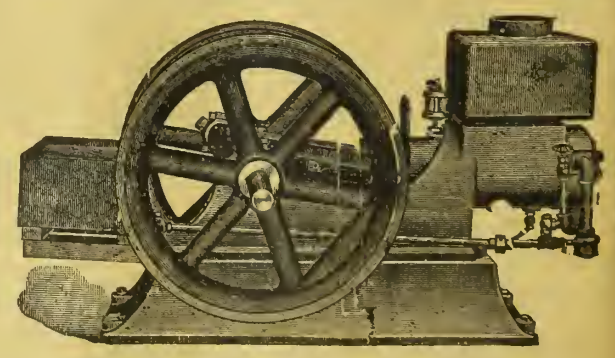
The Sussex Motor Company's Gasoline Engines

are the easiest started engines in the world on cold days—hot days—dry days—any day you can have the wheels spinning, doing your work without fuss or danger.

Notice how steady the centrifugal governor adjusts the speed to the load—regular as a clock. See how the spark is cut out on the idle strokes to give your batteries or magneto long life. Watch the exhaust—clear as the air—no black smoke—that means fuel economy.



After you have used it one year, two years, many years, you will, like others, write us that it is the ONLY gasoline engine for you.

Not JUST ONE convenient feature, but ALL of them stored up in an engine that a child can start and run.

The Price? Just as reasonable as a good engine must cost because it takes care and time and expense, as well as good materials to build a good engine—such as true economy should demand. Not the false economy that makes you suffer trouble and annoyance and delay and expense.

The Sussex Motor Co. engine is easy to try — easy to buy. Satisfy yourself that it is the one best bargain. Built for Kerosene, Gasoline or Gas. Write for Catalogue and Prices.

Variation of the Composition of Cow's Milk.

The Irish Homestead publishes the following. Some carefully conducted experiments in connection with the variation of the composition of cow's milk with the advance of lactation have been conducted at the Garforth farm of the University of Leeds. The records extended for three years and include 70 completed periods of lactation (34 cows), of which 57, each extending over six months or more, have been used in compiling the tables given later. Careful analyses were made. The following is the summary arrived at:—

With regard to the rate at which the milk yield falls with advance of lactation our records indicate that after the first two or three months this is much more rapid in the case of cows calving in the months March to June than in the case of cows calving at other times of the year. The greatest average yield for the whole period of lactation was obtained with cows calving in January and February.

With regard to changes in the composition of milk our tests have brought out very clearly the fact that the variations in the composition of milk with advance of lactation may differ greatly in the case of the different cows so that no precise generalization upon the subject can be formulated.

Roughly speaking, however, the milk is richest in total solids, fat and albuminoids in the earliest and latest stages of lactation and poorest about the second or third month. The sugar content tends to decrease steadily with advance of lactation after the first month or so, but the proportion of ash remains approximately constant.

A Millstone Around his Neck.

That is what the "boarder cow," the "robber cow," the unprofitable scrub cow is to the farmer. Go where I will for my figures, I find the average production so low that those cows that go below the average must be losers to the keepers.

Just lately I got figures from several creameries and then ascertained the number of cows that contributed to the center of manufacture and was not surprised to learn that the average production per cow was from 156 to 184 lbs of butter. I was not surprised because I have been meeting the same results in almost every investigation I made where a considerable number of cows was concerned. The man with the average cow was not holding his own and how did the man with those below the average fare?

The price of butter will never be high enough to make a 125 lb. cow profitable. The only way that cow can be of any use to the world is to furnish prime extra choice beef for the hotel and restaurant table. The farmer who keeps and feeds her is getting poorer every day and so is his farm. If you come to my place I will show you some of both but you need not come—you have them right at home.

That poor fellow slaving year in and year out, working hard and long never thinking a thought but faithfully feeding a herd of "boarder cows!" And some of you fellows who want to be pretty wise are doing it, in fact I care not how wise you are, if you have not kept an account with your cows with scale and pencil, you are feeding some "robber cows."

Why men should persist in such work may seem a mystery to some, but it is quite natural. They are in a rut and it is easier to run along in the rut than to turn out on unused and unworn ground. It takes nerve to be laughed at and be given the guffaw and that is what always happens to the man who turns out of the rut in word, thought and action. But had no one tried new ground and defied the "standpatter" we would still be dwelling in caves and cooking meat by dropping hot stones in a pot. Time was when a man who defied fixed customs was declared a heretic and put in a dungeon but now the world only haw haws at him.

INTERNATIONAL STOCK FOOD

Means a Gain of One to Three Quarts of Milk Every Day

Thousands of Farmers and Dairymen have proved that this wonderful cattle tonic increases the milk flow increases the butter fat, keeps the cows vigorous and healthy, insures sturdy, well nourished calves, and saves practically one-fourth the grain feed.

Owing to the tremendous success of International Stock Food all over the world, the country is flooded with imitations and substitutes. Be on your guard. Insist on having the genuine—sold by dealers everywhere. If you will write and tell us how many head of stock you own, we will forward to you free our $3,000. Stock Book.

INTERNATIONAL STOCK FOOD CO. LIMITED, TORONTO. 105

Eddy's Matches

The Choice of Generations.

Sixty-two years ago your Grandmother kindled the fire with the "Eight-day" sulphur—the first EDDY product. To day most of the nine million Canadians favor the new silent "Ses-qui" non-poisonous matches, or one of the many other brands made by EDDY. Ask your dealer.

Choose Good Stanchions

What's YOUR idea of a GOOD Stanchion?

Isn't it one that will never bulge or sag, one that will last you a lifetime, one that will lock and unlock as easily a year from now or ten years from now as on the day you bought it—and one that holds the cattle surely?

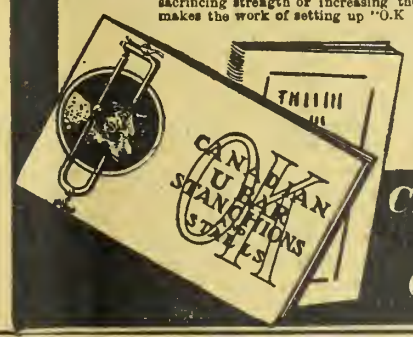
The O. K. Canadian Stanchion comes up to all these requirements—because we've been making Stanchions so long that we're on to every wrinkle in the business and we know just how to make every part best and what to make it of.

Frames of the best U-bar or channel-section steel—so strong and rigid that they simply can't bulge or bend.

Swing bars hinged high instead of at the bottom—so they will always be easy to lock and unlock—and fixed so that they cannot fall to the floor when open, to be tread on and bent.

A lock that's so simple that it can't get out of order in years of use, easy to work, and proof against the "slickest" cow.

The arched post design of O. K. Canadian Stalls prevents the cattle's walking through into the feed trough or pulling feed back into the stall and still leaves plenty of room at the top for operating the Stanchion, without sacrificing strength or increasing the cost. Our patented clamp makes the work of setting up "O.K Canadian" equipments simpler and quicker than any other.



We have a couple of booklets that are chock-full of interesting points for dairymen and they'll show you how to figure just what an "O.K Canadian" equipment will cost for Your barn whether you want just the Stanchions or whether you want to put in complete metal stalls. They're yours if you'll ask for them. Department C

"There could be no better medicine than Chamberlain's Cough Remedy. My children were all sick with whooping cough. One of them was in bed, had a high fever and was coughing up blood. Our doctor gave them Chamberlain's Cough Remedy and the first dose eased them, and three bottles cured them," says Mrs. R. A. Donaldson, of Lexington, Miss. For sale by all dealers.

LIVE STOCK.

The Gilt's First Litter.

Most of those among us who are interested in pigs have noticed the fact that pig-breeders, as a rule, regard it as part of their system of manage ment to take a first litter from the gilts which they save for stock at the end of a year from their birth. I remember how much I was struck with the diminutive size of a Jersey heifer —the first I ever bred, if I am not mistaken—which came into season and was served at the end of about sixteen months. She never seemed to grow, but matured early, and remained an abnormally small cow. Growth is not always impeded to this extent by service at an early age, but the lesson had its influence. All experienced breeders of pigs are aware that a pig will continue to grow, as a rule, and develop after she farrows for the first time, and that at the age of eight months, when service is necessary if it is intended that she should breed at the end of her first year, she is still growing. To check her growth at this time is to spoil her for good. Take a gilt of a large breed, the pick of a litter of the highest type, and assume that she is intended for exhibition. Her chance of success depends practically upon her size other points being equal, but if she is put to the boar at the age of eight months, the size which she might be expected to attain in due course will never be reached, owing to the demand made upon her by the pigs which she carries and ultimately produces. A large sow produces large pigs, and the most careful observations have shown that both the size and the weight of a litter are in proportion to that size, tempered with age, for a mature sow produces more and larger pigs than a gilt. A gilt invariably produces a smaller litter of smaller pigs than when she is older. Thus if age and size both influence results we cannot doubt what is the best course to pursue. Common-sense alone, once the question is thought out, will indicate the desirability of deferring the period of service, and in consequence the date of the first litter, so that more time may be devoted to untrammelled growth.

It is probable that there are some who believe that to defer the first litter means a direct pecuniary loss. After feeding a gilt for a year they regard it as the proper course to obtain a speedy return. It is obvious, however, that if the value of a gilt, which may be kept for breeding for years, is permanently reduced for this purpose, the loss of profit will be largely increased. A gilt allowed to grow to full size will make a better and more certain return than would be possible under other conditions. She will, moreover, make that profit twice a year, while her value will be distinctly increased. However well a gilt may be bred she is immature and imperfectly grown when she produces her first litter at the age of twelve months.

A sow intended to farrow early in March must be served by the middle of November; at that date a gilt farrowed early in March is thirty-six and strong. If she is served the deweeks old, and should be growing fast mand upon her resources is not immediate, and it is not long postponed, but she gradually matures, which is disadvantageous, as the roundness of maturity should be deferred. If, however, we wait until April arrives we give the gilt an extra twenty weeks for growing and developing, in which case she may be allowed to farrow early in August, when the weather is fine, so that her first litter will obtain the full benefit of the mild temperature of late summer and Autumn before they are fat and sold. Can it be doubted that under such conditions a young sow will be much superior to what she would have been had she littered in March, and that her pigs will be finer specimens, and realize more money? In the ordinary course of pig management a sow littering early in March should litter at a similar date in September, and so her pigs growing, fattening, and being weaned in time, she will come into use with November, and be so mated again for March farrowing. In the case of the gilt, which has produced her first little family in August, extra time is advantageously allowed; she may retain her pigs a little longer, and, with her liberty, rest as long as it is safe to allow her before she is again mated with the boar to come in with her second litter in March.—Jas. Long.

Bacon Curing on the Farm.

When thoroughly stiff and cool, the head should first be removed and the carcass cut into two sides by sawing down the back from the tail to the neck. There are many different methods of cutting up a pig, however. In the south it is usual to take out the belly piece first; in Cumberland the spine is generally removed in one piece, accompanied by the breast bone and the two small ribs nearest the shoulder; the old Ayrshire curers split the carcass down the middle and afterwards hang up the two sides by hooks thrust through the gammon hocks. In the ordinary way, when the head has been removed, the "chines" or backbone, should be cut out, and removed very carefully so as not to take too great a proportion of lean meat; if thick chines are taken much of the lean meat of the back is removed at the same time, so that the fat rasher is produced as compared with that from a medium pig, where there is a fair proportion of fat and lean. Afterwards the hocks and forearms may be removed, and also the spare ribs, if the pig is a large one. The fillets, or "lean meats," are cut from the flitches, and the ham cut out at about the third joint from the tail. From the head can be cut jowls or cheeks, eye pieces, tongue, ears, and nose pieces. These pieces, together with the heart, liver, lights, etc., can be made into brawn, collared head, potted pork, and tongue, etc. The leaf and other spare fat can be rendered into lard, while sausages can be made from other spare parts. When well cleaned and boiled the stomach and the chitterlings can be used as tripe, while the spare ribs may be roasted, and then the lean meats used for pies.

CURING.

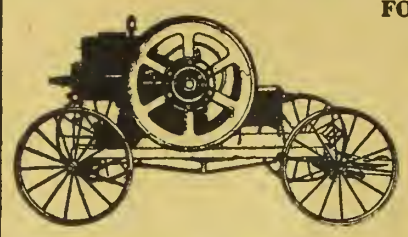
The curing of bacon should be conducted in a moist atmosphere at a temperature of from 40 degrees to 42 degrees Fahr. The meat may be either dry-salted or pickled, and although the former is certainly the more convenient and less troublesome method, a very large number of curers have now adopted the use of the pickle pump or syringe for injecting a suitable preparation into the meat. The carcase must always be thoroughly drained of blood and of all impurities before any attempt is made to salt or pickle it, the large blood veins being carefully removed beforehand and the carcase neatly trimmed.

A simple recipe for dry-salting the meat is to rub both the skin side and the inside with a mixture consisting of equal proportions of salt and brown sugar, with ½ oz. saltpetre to each 1 lb. of the mixture.

Another recipe is:—14 lb. coarse salt and 1 lb. saltpetre to a 10 score pig. For a small pig not weighing more

FOR YOUR FARM, YOUR HOME, YOUR FACTORY

FOR EVERY POWER PURPOSE, A



GILSON

"GOES-LIKE-SIXTY"

ENGINE

MORE VALUE, MORE POWER, MORE SERVICE, MORE SATISFACTION

Does satisfaction mean anything to you? Does money saved in fuel, in time, in repairs and expense bills appeal to you? Get Gilson Facts, and find out how the Gilson 60-SPEED engine does the greatest variety of work—how it gives the maximum satisfaction—saves money in equipment, and yields 100% service at lowest cost. Every engine covered by a cast-iron guarantee.

NEW FEATURES AND LATEST IMPROVEMENTS

The new Gilson 100% SERVICE ENGINES, 4 HP and upwards, are equipped with our new friction clutch pulley with five interchangeable rims, each of a different diameter. Change to the proper speed for every job in a few minutes. A NEW and EXCLUSIVE GILSON FEATURE. These engines are also equipped with a magneto, without batteries or coil, with spark retarder,—no cranking necessary. A child can start them.

We also make 60-SPEED engines in 1½ and 3 HP sizes. These are mounted on truck, with line shaft and five interchangeable pulleys, and pump-jack. Drop us a card to-day, and we will send you full descriptive literature. We are making special prices to the first purchaser of one of these engines in every locality. Write NOW.

Other Offices at Montreal, Fredericton, New Glasgow.

than 8 score the carcase may be cut into four quarters, the bones removed, the forelegs cut off close up the side, and the shank bones removed from the hind legs. The four quarters are next sprinkled with 2 oz. of saltpetre, and from 3 to 4 lb. of common salt. Then they may be piled up one on top of the other and left for ten to twenty days, rolled up (Ayrshire fashion) and tied with twine, placed in muslin bags, and stored in a cool place. The quarters may be numbered according to the degree of curing, and in this way it will be possible to secure various degrees of mildness in the curing process for short or long keeping, as the case may be.

PICKLING BACON.

A really good qnality mild-cured bacon can never be obtained unless the brine or pickle is injected into the side with the brine or force pump, after which operation all that is necessary to complete the pickling is a sprinkling of dry salt, the hams being turned at intervals for about two or three weeks, when they will be ready for smoking.

Pickling ensures that the meat is salted more uniformly than in the case of dry salting. A good pickle for the purpose is composed of 1 lb. of saltpetre, 1 lb. of dry antiseptic, 1 lb. of black sugar or one pint of treacle, and 11 lbs. of common coarse salt with water to make up four gallons. This pickle is a suitable one for hams. For bacon, the following ingredients may be boiled together and the concoction afterwards skimmed quite clear before using:—13 lbs. of salt, 1¼ lb. of saltpetre, 1¼ lb. of dry antiseptic, and 1½ lb. of cane sugar with water to make up three gallons. A salinometer, which is a modified form of hydrometer, is necessary when using a pickle for bacon; otherwise it is impossible to tell whether the mixture is at the right strength. The salinometer should be registered 100 degrees; if it registers less than this more salt should be added.

Shorthorn Color Here and There.

North America is the only country in which the Shorthorn has ever held its own colors. In all the countries of continental Europe the descendants of animals imported from Britain have taken on more or less of the form, character and color of the native stocks—environment being stronger than heredity in those cases. For instance, the "Durhams" bred in France, and just as well bred as many in their native habitat, are quite different from those produced in Russia, and both differ materially from the parent stock. Of course there is a racial resemblance, and the roan colored and its derivatives only, but or perseveres as characteristic of the the general style and contour rapidly undergo changes.

In Argentina the tendency of all cat-hammed and yellow after the pattern of the old Spanish stock. This supplies the reason why importations of fresh blood must constantly be made, and the Argentine preference for reds of rich, dark roans is also explained by the persistent washing out of the coat toward the yellowish tinge. In Australia the same tendency has to be overcome, but as practically all the breeders in the Island Continent are of British extraction, their more careful methods have to a large extent counteracted it, rendering infusions of fresh blood in great and frequent volume less necessary than in the instance of the instance of the Argentine Republic.

In New Zealand conditions affecting cattle, their conformation and their color are second only to those prevailing in Britain and the northern half of the American continent. In South Africa it is relegated, the breed seems to include an undue proportion of red-and-white among the native pure-bred cattle—what may properly be called spotted ones—but whether this is a result of climatic and other regional influences or because of an effort on the part of importers to get cattle mostly red but with some little white about them, we have not heard explained. One peculiar variation from the parent stock, we are told, in South Africa is a tendency of cattle either pure-bred Shorthorn or largely of that blood, to become broken-colored about the foreparts and particularly the head and neck, a rim of dark color invariably showing around the eye. Possibly this tendency to broken color—red and white—in the grades has been handed down by the Africander shestock with which the pure-bred hulls have been mated, but that would not offer any explanation of any similar phenomena in the instance of cattle of uncontaminated lineage. We are not aware whether this tendency to assume a parti-color is general all over the vast grazing lands of South Africa, but it has been noticed by more than one observer.

In Chili and clear over to the other coasts of South America in Brazil, Paraguay and Uruguay the tendency of the grade cattle is always toward the light red or yellow mentioned in connection with Argentine breeding operations, degeneration in this respect being much more rapid when any very close breeding is tolerated. In fact it seems that the more promiscously the cattle are permitted to breed, the quicker is the descent toward the detested colors of the old Spanish sorts. Research suggests also that when moved to Oriental countries Shorthorns take on the light red-and-white speckled coat so common in almost every land, this being true in countries where cattle of the species to which all the improved breeds belong are not indigenous.

There must be some good reason for this change. What is it? Why is it that when turned out and left to themselves, the roan color is the first then the white to disappear among cattle of Shorthorn extraction?

These are matters of speculation, of course, and without real value to the breeder. After all though, it is rather more than strange that only in the islands of Britain and in Canada and the United States—with the possible addition of New Zealand distant thousands of miles—should the original colors of the Shorthorn persevere without the constant injection of fresh blood. Why is it, also, that in realms so widely separated geographically as Japan and South Africa the same tendency to assume a light red-and-white, spotted hue should appear? Why is it that in some countries the birth of a white calf becomes so great a rarity as to be an event of local importance, whereas, in other countries it is absolutely impossible to prevent such occurences, no matter how religiously white or light-colored parents are tabooed?

It may be again that some of the data presented, as already suggested, are representative of local rather than general conditions in some of

Feeding Colts For Growth.

The problem of wintering colts in an economical manner is before many farmers at this season. The man who is in the horse business in a large way realiles the importance of keeping the colt at a high point of thrift and growth throughout the year. Many men, however, who raise but one or two colts a year are prone to let the youngsters take pot luck with the work horses out in the stalk fields or on the sheltered side of the straw pile.

This is perhaps the cheapest way of carrying them through the winter, but it is false economy which redounds to the detriment of the colt, his development, and his final value. Size is fundamentally essential in the draft horse. It cannot be obtained to the maximum unless the animal is supplied with sufficient feed of proper quality throughout its growing period.

The needed nutrients are found in a ration of oats three parts, bran three parts, corn three parts, and oil meal one part, together with alfalfa hay and whatever straw, stalks, and similar roughages the colt's appetite leads him to consume.

Stinting the feed stunts the foal. Fifteen bushels of grain feed will generally add $25 or more to the value of the colt in the spring over his value, had he been merely "carried" through the winter.

Exercise in the open is essential. Observation of the hoofs, seeing that they are growing normally and trimming when necessary should be attended to religiously. The quarters in which the colt is sheltered should be light and clean. A lousy colt in a dark dungeon of a stall is an object for pity and will not be worth much more in the spring than he was in the fall. Often he will be worth less.

Feed and care for the foal so that you do not have to apologize for his appearance. Watch him grow. Take a pride in his development. Don't feed him so that he becomes a ball of fat, but see that he is developing muscle and bone. Don't let him become pot-bellied by eating unpalatable non-nutritious roughages, but feed him enough of palatable nutritious feed to give him the stretch that is necessary to rapid development.

Do the right thing by the youngsters and they will surprise you in the spring; more than that they will repay you highly should you care to dispose of them.—D. O. Thompson.

Causes of Corns in Horses.

Some feet are predisposed to corns, and causes are narrow, deformed hoofs, deformity of the limbs, bad trimming, wide, flat feet, excessive weakening of the sole bars and frog, permitting the toe to grow too long, shortening one quarter too much, so that the foot is unbalanced, shoeing a heavy horse with too light a shoe, thus permitting the shoe to spring down on the heel. Permitting the feet to become too dry and brittle, thus reducing the elastic properties of the horn, and nailing the shoe too far back, thus preventing the natural spread of the hoof when placed upon the ground, applying the shoe too hot while being fitted, and other causes. Horses which have never been shod rarely have corns, thus proving that corns are due to errors in shoeing.

TREATMENT.

First remove the cause by paring the hoof to the proper angle; shorten the toe and cut down the quarters if too high. Put on a level shoe. If calks must be used, use both toe and heel calks, never toe without heel, nor heel calks without toe, unless for a special purpose. A leather sole should always be used under the shoe and place a dressing over the sole of the following mixture:—Pine tar, 8 oz.; Venice turpentine, 1 oz.; spirits camphor, 1 oz.; compound tincture benzoin, 2oz. Mix and smear plentifully over the sole, after which apply oakum and the leather pad. When there is a suppurating corn, the shoe should be left off for several days and drainage for the pus established. Poultices of flaxseed should be applied in which has been placed creoline, about 2 oz. When the lameness has been removed, the horse should be carefully shod, using a bar shoe with a leather sole, and the above dressing. The after-care of the hoof consists in keeping it cool, moderately moist and pliant.—San Francisco College.

Horse Liniment

AFTER USING

Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and notice, its effects, and, honestly judging it on its merits, you will be compelled to endorse it.

Examination of Stallions.

Regulations for the examination of stallions have for some years been in force in New Zealand, but they are not wholly effective, because while they grant certificates to sound stallions they do not prohibit the use of those that fail to pass the veterinary examinations. It is only to be supposed, however, that some of the owners of disqualified horses take the veterinary's decision very badly, and as it is possible that veterinaries may sometimes err, regulations regarding appeals are as follows:—

Any owner of a stallion who is dissatisfied with the refusal of a government certificate in respest of his horse may appeal against the Minister at any time within thirty days of the examination, under the following conditions:—

(a) That the appeal be in writing and be accompanied by the lodgment of £5, such amount to be forfeited in the event of the appeal not being upheld, unless the board shall for good cause otherwise direct.

(b) That the appeal be accompanied by an undertaking to pay railway fares and hotel expenses incurred by the Board of Appeal in connection with the settlement of the appeal.

(c) That, in the event of refusal having been on the ground of unsoundness, the appeal be accompanied by a certificate from the veterinary surgeon setting out that the horse has been found by him on examination since the refusal appealed against to be free from all the unsoundness set out in Part II. of the regulations:

(d) That, in the event of the refusal having been on the ground of below standard for Government approval, the appeal being accompanied by a certificate from the president and two members of the committee of the society under whose auspices the parade was held, setting out that in their opinion the horse is of fit and proper type, conformation, and breeding to be approved as a stud horse.

On receipt of notice of appeal in proper form, and with the above conditions complied with, the Minister will appoint a board of appeal, which shall consist of—

(a) In the case of appeals against refusal of certificate on the ground of unsoundness, the chief veterinary officer and two practising veterinary surgeons.

(b) In the case of appeals against refusal of certificate as being below standard for Government approval, the chief veterinary officer and two horsemen of repute and standing.

Such board shall act and decide on the appeal, and its decision shall be final, and not subject to review.

Casting a Horse.

The most simple and inexpensive methon of casting a horse requires only a soft, strong rope 50 feet long. The addition of hobbles, to which iron rings are attached, eliminates the chance of rope burns about the fetlocks of the hind feet, but hobbles cannot be used on unbroken horses.

Knot the rope at the middle of its length so as to make a loop, which, when passed over the horse's head, will fit the neck like a collar. The knot is placed lowermost and each end of the rope is now pasted backward outside of each foreleg and then between the hind legs and around the respective pasterns.

Before running the free ends through the loop collar pass each end over the backward length of the rope. This holds the rope more snugly about the pasterns and lessens the chance of the animal stepping out of the rope. A steady pull by assistants on each side will throw the animal. The hind legs may be drawn to the horse's sides and securely fastened.—O. L.

Schirrhous Cord.

O. K.—Four year old gelding, castrated when a yearling, developed a lump. It was hard and about the size of a nutmeg when first noticed. It seemed to be attached to the cord in the scrotum. Within four days the lump increased to the size of a man's head. The whole of the scrotum became inflamed, which was a hard, hot mass, painful to the touch, and leaving dents for a short time after being pressed on with a finger. After eight days from commencement the swelling gradually descended into the sheath. At the same time the inflammation itself in the scrotum seemed to go down a little. The sheath increased in size every day, till inside of two weeks it was hanging down about one foot, with a width of eight inches. The inflammation went out of the sheath after 12 days, and a small bag about the size of a stallion's purse remained, in which one can feel a hard lump on each side. They are hard, flat, and seem to be on the cord. When touched, the horse will draw it up, at the same time drawing up the whole bag, the lower skin of which is attached to the lumps. After four weeks one side of the bag broke at night, and must have discharged some matter. It healed up immediately. There is no inflammation whatever now, but the bag with the lump remains. The general health of the horse was in no way impaired, and he has actually increased in weight. He was worked regularly before becoming afflicted, but not during illness; only exercise was given. The swelling was bathed three times daily with hot water. 1. Was this dropsy? 2. Is this a rupture? 3. If the horse needs operating upon, when is the best time to do so? he being urgently needed for spring work on the farm. 4. Should he be worked now?

Ans.—Your horse has what is known as "Schirrhous Cord," sometimes seen after castration; may appear soon after or may not be noticed for a considerable time alter. It frequently suppurates and has a tendency to increase in size, the only treatment is an operation to remove the schirrhous end of the cord, and the sooner it is done, before it attains too great a size, the simpler the operation and the quicker the recovery. It is claimed by some that one drachm doses of iodide of potash will cause absorption of the enlargement, but I have never seen any treatment that proved satisfactory, but the entire removal of the diseased parts under strict antiseptic precautions and antiseptic treatment offers complete recovery in about three or four weeks.

Breeding Age.

As a general rule it is not wise to breed mares until they are about three years of age, as early breeding tends to stunt the growth of the animal. In the case of very large strong draft fillies that will wiegh 1,400 lbs. at two years of age, there is no objection to breeding, providing special care is taken to feed more liberally than usual. Breeding large draft fillies seem to broaden them out, and if they are permitted to skip breeding the following year, they will be fully as heavy at five years as the mares that were not bred until three years of age. This plan often gives advantageous results in fillies that are overgrown, awkward and lacking in good proportions.

Early education for the colt; nothing like it.

POULTRY.

Prime Poultry, What Does It Mean?

The "Jersey Brand" of dressed poultry has probably a better commercial record than poultry from any other section of the country. It stands well to the front, and commands the highest prices, especially in the New England and New York city markets. In these markets it is known as "Philadelphia poultry," although the product is not grown in Phildelphia, but principally comes from the southern part of New Jersey.

There is a reason for this popularity, and the secret in the preparation of this class of goods might profitably be observed in other sections of United States and Canada.

Philadelphia poultry is not free range stock. This makes it more tender. Poultry allowed to roam all over the fields while growing, have hardened muscles and the meat is more or less toughened. Philadelphia poultry is raised by poultrymen who confine the stock to limited quarters, and feed such foods as will the most quickly properly fit the stock for market. Philadelphia poultry is quickly grown. The farmer's fowls at nine months of age are more tough than fowls twice the age from the yards of practical poultrymen.

The South Jersey poulterers stall-feed to a certain extent. They give only the purest of food, do not allow too much exercise, and two weeks before marketing the stock is placed in fattening pens and thus put into a condition where the meat is soft and tender, and the carcass plump and fat. That is South Jersey's secret, and that is what made "Philadelphia poultry" famous.

It is a fact that the meat of yarded fowls is more juicy, which, as a rule, is not the case with the free-range stock. It is not alone that the violent exercise that they receive while out on the range, but rather upon the food they secure that adds a taint to the flavor. Such articles as onions, too much grass, decayed stuff, manure piles, etc., are not calculated to improve the taste of the meat.

But, notwithstanding the good name Philadelphia built up for her poultry shipments, quite a different state of affairs existed up until a year or two ago with the product consumed at home. The choice stock was sold to the first class trade at home, and the poorer classes of people had to be contented with inferior stock imported from some of the big Western packing houses.

About a year or so ago Dr. A. F. Schreiber, chief of the Philadelphia corps of meat inspectors, began war against this class of goods, declaring that "the imposition practised upon the public by the big Western packers was just as great as the frauds in their beef and other meat trades."

He continued: "The stuff they get comes from the storage boxes of the big Western packing houses. It has been kept here in many instances for more than a year."

It is certain that such stuff is unfit for food. When exposed to the summer air the skin is apt to turn black in places, and the carcass has a characteristic musty odor. When cooked, the flesh has a reddish tinge, and the meat is tasteless.

The writer has always held that the refrigerator stock shipped east is unfit for food. It would be a God-send if all cities would follow the plan act by Philadelphia to drive out all such stuff. If the Board of Health of each city will adopt strict rules in this particular, and have their inspectors keep a close watch on the poultry sent in, it would not only prevent much sickness, but would be of great benefit to honest poultrymen who supply choice fresh stock.

An inspection could also be made of the poultry hanging up in the markets. Some of it has a very suspicious look, indicating that when alive it was not in the best condition. No honest poultryman or farmer will send to market carcasses that they would hesitate to use on their own table.

Where the attention of the male becomes a perfect harassment, the nervous derangement may decrease the egg record. It is, therefore, safest to have not less than ten females mated to each male bird, and after breeding season it is best to remove the male from the flock altogether. Hens will lay just as well without the attentions of a male as with them.

A broiler should be short in head; broad, deep and full in breast; small in comb (rose or pea); and a pound and a-half to two pounds in weight. The body should be short, deep and well rounded; the back short, broad and flat at the shoulders; and the skin of a rich yellow. The legs short, and the thighs stout; the color of a bright yellow.

The spring chicken is one hatched not earlier than February, nor later than May, and is of market weight at two or three pounds.

Some tell the sex of the Guinea fowl by its wattles. Those of the male are double the size of those of the female.

There is practically no danger of overfattening the laying hen. It is almost impossible for her to make eggs and fat at the same time.

It is doubtful if caponizing will ever gain a foothold in this country. The difference in price between a capon and a properly fed soft roaster is so little that it is not profitable to take the risks.

The breast of the Indian Game is very much like that of the pheasant or the Prairie chicken. The heft of the meat lies on the breast.

Fowls should be deprived of food from 14 to 16 hours before killing. If this is not done, and they are full of food when killed, the carcass soon decomposes, turns the bird green and renders it comparatively worthless. Wegemeir says that even if the food has passed out of the crop into the bowels the fowls will not keep long, as the half digested food in the interior causes them to spoil and gives an exceedingly unpleasant flavor.

Pet ducks are scarce; it is a fact that they rarely make friends.

In turkey culture, a single union of a male and female fertilizes all the eggs the hen will lay in one season; hence, one gobbler should be enough for twenty or more hens.

About 70 years ago, prizes were offered at the dairy shows of England for the best and largest poultry. Noblemen of the highest rank became competitors at these exhibitions. In 1832 Earl Spencer carried the highest prize for a turkey which weighed 20½ pounds. One capon was exhibited which weighed seven pounds and fourteen ounces; one pullet, six pounds and three ounces; one goose, eighteen pounds and two ounces; one pair of ducks, ten pounds and ten ounces. In December, 1822, two turkeys were sent to Cork, one weighing 33 pounds, and the other 34 pounds. In December, 1833, three turkeys were sold at Leadenhall market, which weighed ninety-one pounds, and brought three guineas each. One 18 months old, and weighing 34 pounds, was sold at the same price.

Turkey tail and wing feathers are made into feather dusters, and "feather bone" manufacturers give from 15 to 25 cents a pound for them. Body feathers, used for cheap pillows and mattresses, bring from two to three cents per pound. No one who

Have you talked with your neighbors about subscribing for THE MARITIME FARMER? Why not do it now? Make up as large a club of subsbribers as you can and sena them in

uses scalded water to remove the feathers should expect to get the best price. They bring more if carefully sorted and shipped in bags or shoe boxes.

George Tucker, of Rhode Island, probably grows more turkeys than any other person in the State. His records show 225 young from 22 hens; 306 young from 28 hens; 240 young from 30 hens; 322 young from 36 hens; and 425 young from 35 hens. In order to feed and look after this number of turkeys, one of Mr. Tucker's daughters has to go about three miles to go the rounds.

Along the shores of Naragansett Bay and Sound, and especially about Little Compton and Tiverton, geese are more generally kept than in any other part of New Eng,and. In the region of Naragansett Pier, Point Judith, and on Black Island, many farmers raise geese. The young geese are bought in large numbers by dealers who fatten them and prepare them for market with such success that Rhode Island geese bring more in Boston and New York than those from any other part of the country. In fact, the home supply is not equal to the demand, and to prolong the season and fill their orders, dealers are obliged to secure geese in Canada, Prince Edward's Island and other sections of the country.

Cottonseed meal should not be fed too liberally, as it then acts rather disastrously on the productive organs. It is really not advisable to add it to the bill of fare for laying hens.

A series of experiments undertaken at the New York Experimental Station, made it very conclusively appear that where hens were kept without a male, eggs were produced at about 30 per cent. less cost than exactly similiar pens where cocks and cockerels were kept. In some pens, too, the production of eggs was nearly a third larger in pens where no males were kept than in others of precisely of the same kind, managed in the same way, except that the presence of no male was admitted.

Taking up separate branches of poultry culture and depending upon them for a living, it about as risky as the man on the farm, who would devote all his land, time and money to a single crop.

The Egg Circle Movement.

Following a series of lectures given in various parts of Prince Edward Island, Mr. T. A. Benson, Dominion Poultry Representative, working in co-operation with the Provincial Department of Agriculture, has for some weeks been engaged in practical field work, with a view to demonstrating along the lines of his lecturing, and the question of marketing eggs has been given first place. Those who have given the matter even a passing thought have long recognized the evils arising from the present methods of marketing as ordinarily practised, and the urgent need of some remedial measures being taken; in fact, public feeling in many sections has been so strong as to constitute a demand for a betterment of conditions. Under present methods, speaking generally, an egg is an egg, providing the shell is intact, and what is known as the "flat rate" system prevails; all eggs, good, bad, or indifferent, commanding the same price, which methods of breeding, feeding and caring for poultry and market eggs, are means that those practising careless on an equality with those who adopt correct methods with the one exception of course that the farmer class of poultry keepers obtain a smaller production of eggs. It may, in fact, be said that a premium is placed on slovenly methods. All this results in a loss of not less than 17 per cent. of the total egg production of the Dominion of the value of five dozen eggs in every thirty marketed, nearly all of which loss is preventable. This heavy loss must of necessity fall principally upon the producer and in part on the consumer. Another bad feature of present conditions is the great difference between the price realized for eggs by the producer and the prices paid by consumers by reason of there being too many handlers of the product, which considering its extremely perishable nature should reach the consumer in the shortest possible time. The object in view in organizing co-operative egg selling associations, known as egg circles, is to eliminate those evils and place a premium on good methods and good eggs, thus giving encouragement to those wishing to be honest and do the right thing. There is room for much greater profit to the producer without increasing the cost to the consumer if the present waste and some of the unnecessary handling are eliminated. There is a great and ever increasing demand for the good article and it is for the producer to co-operate more closely with the consumer and see to it that this demand is satisfied.

Two of these associations known as Egg Circles are already doing business on the Island; one in New London, and another at Kensington, having between them a memberehip of upwards of 150 to date and applications for membership continually coming in. It is the intention as far as possible to obtain the assistance of those engaged in handling eggs in each district where these associations are to be organized, but the merchants and dealers appear to view the enterprise from varying view points. Some are opposed to it, declaring they will put up their peices for any kinds of eggs to fight the movement down and this has already been done. Which is it, have these merchants been paying too little in the past, or are they losing money to keep the farmers in the old rut to-day, and stand in their way? It is pleasing to note, however, that other local merchants view the matter differently and are glad to cash the cheques of the associations which the farmers are offering in doing business with these merchants.

If the methods and working of the egg circles are considered without bias, and false reports which have been circulated, investigated, it will be found that nothing but good can result from this work. The merchant will be benefited more by the farmers' cash than by the eggs; and they will get the farmers' cash if they offer good quality in all departments and there are evidences that the larger dealers will welcome anything which will improve the quality of eggs and be willing to pay in accordance with quality.

It is hoped that Mr. Benson will receive the unqualified support of all in the good work which he has been appointed by the Department of Agriculture to carry on, and which will undoubtedly result in more and better eggs on the market without increased price to the consumer, and a fair profit for the legitimate middleman.

The farmers of P. E. I. will do well to carefully consider this movement and ask themselves why there should always be strong opposition when they attempt to stand together. This is an opportunity for the building up of one of the most important farm products, and elevating the industry to such a level as to wipe out the suspicion of eggs which is one of the greatest factors in curtailment of consumption. Why should the farmers' right to manage their own affairs be disputed? And why should they not stand together in this matter as they did in the question of creameries, and secure an equal or even greater advantage?

A Severe Cold

Settled On Her Lungs.

Mrs. Geo. Murphy, Spence, Ont., writes:—"I have had occasion to use Dr. Wood's Norway Pine Syrup, and can say it most certainly is a wonderful medicine. Last winter my little girl, just a year old, took a severe cold which settled on her lungs. I tried everything, and was almost in despair, when by chance I read of Dr. Wood's Norway Pine Syrup, and decided to try it. I got two bottles, and as soon as I started to use it I could see it was taking effect. I gave her three bottles in all, and they completely cured her."

Dr. Wood's Norway Pine Syrup is a universal remedy for sufferers from all bronchial troubles. Coughs and Colds of all kinds, Bronchitis, Sore Throat, Hoarseness, Croup, Asthma, Whooping Cough, and Throat and Lung Troubles, disappear quickly after a few doses have been taken.

It will stop that distressing, tickling sensation in the throat which causes coughing and keeps you awake at night.

Price, 25c; large family size, 50c. Put up in a yellow wrapper; three pine trees the trade mark; manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Refuse substitutes.

FARMER ADS BRINGS RESULTS

"Goods that Don't Come Back Make Customers that Do Come Back."

Hardware Dealer's Magazine

That is one thing about the MONARCH—it stays sold. And why shouldn't it?

It is good to look at; a reliable baker; easy to operate; saves time, fuel and labour. In short the—

Enterprise Monarch

gives good service for a lifetime. Hence every MONARCH sold stays sold, and means the sale of more in the neighborhood.

Housekeepers want it, because it fills the bill for a first-class, modern, handsome steel range at moderate price.

The Farmer's wife wants it because it burns wood or coal and has a large copper reservoir which heats water quickly.

The Farmer wants it, because it does not waste fuel nor give him bother with frequent repairs.

WE GUARANTEE EVERY MONARCH SOLD

Write us for illustrated circular and particulars.

Manufactured By the Enterprise Foundry Co. Sackville, N.B.

Sold by all Enterprise Dealers

WOODEN pails and tubs are as much ou of date as the scythe and the sickle—and just as unpractical.

Eddy's Fibreware

gives superior results—for less money. Pails, tubs, dairy utensils, etc.. made of this material are light, tight and durable. They have no hoops to drop off—no seams to crack. And they outwear the wooden articles many times over.

Ask Your Dealer

"Just as Good as Eddy's Matches."

This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

"Shall I go away, aunt?" I asked, trembling.

"No, sir," said my aunt. "Certainly not!" With which she pushed me into a corner near her, and fenced me in with a chair, as if it were a prison or a bar of justice. This position I continued to occupy during the whole interview, and from it I now saw Mr. and Miss Murdstone enter the room.

"Oh!" said my aunt, "I was not aware at first to whom I had the pleasure of objecting. But I don't allow anybody to ride over that turf. I make no exceptions. I don't allow anybody to do it."

"Your regulation is rather awkward to strangers," said Miss Murdstone.

"Is it?" said my aunt.

Mr. Murdstone seemed afraid of a renewal of hostilities, and interposing began:

"Miss Trotwood!"

"I beg your pardon," observed my aunt with a keen look. "You are the Mr. Murdstone who married the widow of my late nephew, David Copperfield, of Blunderstone Rookery?—though why Rookery, I don't know."

"I am," said Mr. Murdstone.

"You'll excuse my saying, sir," returned my aunt, "that I think it would have been a much better and happier thing if you had left that poor child alone."

"I so far agree with what Miss Trotwood has remarked," observed Miss Murdstone, bridling, "that I consider our lamented Clara to have been, in all essential respects a mere child."

"It's a comfort to you and me, ma'am," said my aunt, "who are getting on in life, and are not likely to be made unhappy by our personal attractions, that nobody can say the same of us."

"No doubt," returned Miss Murdstone, though, I thought, not with a very ready or gracious assent. "And it certainly might have been, as you say, a better and happier thing for my brother if he had never entered into such a marriage. I have always been of that opinion."

"I have no doubt you have," said my aunt. "Janet," ringing the bell, "my compliments to Mr. Dick, and beg him to come down."

Until he came, my aunt sat perfectly upright and stiff, frowning at the wall. When he came, my aunt performed the ceremony of introduction

"Mr. Dick. An old and intimate friend. On whose judgement," said my aunt, with emphasis, as an admonition to Mr. Dick, who was biting his forefinger and looking rather foolish, "I rely."

Mr. Dick took his finger out of his mouth, on the hint, and stood among the group, with a grave and attentive expression of face. My aunt inclined her head to Mr. Murdstone, who went on:

"Miss Trotwood. On the receipt of your letter, I considered it an act of greater justice to myself, and perhaps of more respect to you—"

"Thank you," said my aunt, eying him keenly. "You needn't mind me."

"To answer it in person, however inconvenient the journey," pursued Mr. Murdstone, "rather than by letter. This unhappy boy who has run away from his friends and his occupation—"

"And whose appearance," interposed his sister, directing general attention to me in my indefinable costume, "is perfectly scandulous and disgraceful."

"Jane Murdstone," said her brother, "have the goodness not to interrupt me. This unhappy boy, Miss Trotwood, has been the occasion of much domestic trouble and uneasiness; both during the lifetime of my late dear wife, and since. He has a sullen, rebellous spirit; a violent temper; and an untoward, intractable disposition. Both my sister and myself have endeavored to correct his vices, but ineffectually. And I have felt—we both have felt, I may say; my sister being fully in my confidence—that it is right that you should receive this grave and dispassionate assurance from our lips."

"It can hardly be necessary for me to confirm anything stated by my brother," said Miss Murdstone; but I beg to observe that, of all the boys in the world, I believe this is the worst boy."

"Strong!" said my aunt, shortly.

"But not at all too strong for the farts," returned Miss Murdstone.

"Ha!" said my aunt. "Well, sir?"

"I have my own opinions," resumed Mr. Murdstone, whose face darkened more and more, the more he and my aunt observed each other, which they did very narrowly, "as to the best mode of bringing him up; they are founded, in part, on my knowledge of him, and in part of my own knowledge of my own means and resources. I am responsible for them to myself, I act upon them, and I say no more about them. It is enough that I place this boy under the eye of a friend of my own, in a respectable business; that it does not please him; that he runs away from it; makes himself a common vagabond about the country; and comes here, in rags, to appeal to you, Miss Trotwood. I wish to set before you, honorably exact consequences—so far as they are within my knowledge—of your abetting him in his appeal.

"But about the respectable business first," said my aunt. "If he had been your own boy, you would have put him to it, just the same, I suppose?"

"If he had been my brother's own boy," returned Miss Murdstone, striking in, "his character, I trust, would have been altogether different."

"Or if the poor child, his mother, had been alive, he would still have gone into the respectable business, would he?" said my aunt.

"I believe," said Mr. Murdstone, with an inclination of his head, "that Clara would hape disputed nothing, which myself and my sister, Jane Murdstone, were agreed was for the best."

Miss Murdstone confirmed this with an audible murmur.

"Humph!" said my aunt. "Unfortunate baby!"

Mr. Dick, who had been rattling his money all this time, was rattling it so loudly now, that my aunt felt it necessary to check him with a look, before saying:

"The poor child's annuity died with her?"

"Died with her," replied Mr. Murdstone.

"And there was no settlement of the life property—the house and garden—the what's-its-name Rookery without any rooks in it—upon her boy?"

"It had been left to her, unconditionally, by her first husband," Mr. Murdstone began, when my aunt caught him up with the greatest irascability and impatience.

"Good Lord, man, there's no occasion to say that. Left to her unconditionally! I think I see David Copperfield looking forward to any condition of any sort or kind, though it stared him point-blank in the face!

Of course it was left to her unconditionally. But when she married again—when she took that most disastrous step of marrying you, in short," said my aunt, "to be plain—did no one put in a word for the boy at that time?"

"My late wife loved her second husband, madam," said Mr. Murdstone, and trusted implicitly in him."

"Your late wife, sir, was a most unworldly, most unhappy, most unfortunate baby," returned my aunt, shaking her head at him. "That's what she was. And now, what have you got to say next?"

"Merely this, Miss Trotwood," he returned. "I am here to take David back; to take him back unconditionally, to dispose of him as I think proper, and to deal with him as I think right. I am not here to make any promise, or give any pledge to anybody. You may possibly have some idea, Miss Trotwood, of abetting him in his running away, and in his complaints to you. Your manner, which I must say does not seem intended to propitiate, induces me to think it possible. Now I must caution you if you abet him once, you abet him for good and all; if you step in between him and me, now, you must step in, Miss Trotwood, for ever. I cannot trifle, or be trifled with. I am here, for the first and last time, to take him away. Is he ready to go? If he is not—and you tell me his not; on any pretense; it is indifferent to me what— my doors are shut against him henceforth, and yours, I take it for granted, are open to him."

To this address, my aunt had listened with the closest attention, sitting perfectly upright, with her hands folded upon her knee, and looking grimly on the speaker. When he had finished, she turned her eyes so as to command Miss Murdstone, without otherwise her attitude, and said:

"Well, ma'am, have you got anything to remark?"

"Indeed, Miss Trotwood," said Miss Murdstone, "all that I could say has been so well said by my brother, and all that I know to be the fact has been so plainly stated by him, that I have nothing to add except my thanks for your politeness. For your very great politeness, I am sure," said Miss Murhstone; with an irony that no more affected my aunt than it decomposed the cannon I had slept by at Chatham.

"And what does the boy say?" said my aunt. "Are you ready to go David?"

I answered no, and entreated her not to let me go. I said that neither Mr. nor Miss Murdstone had ever liked me, or had ever been kind to me. They had made my mamma, who always loved me dearly, unhappy about me, and that I knew it well, and that Peggotty knew it. I said that I had been more miserable than I thought anybody could believe who only knew how young I was. And I begged and prayed my aunt—I forget in what terms now, but I remember that they affected me very much then—to befriend and protect me, for my father's sake.

"Mr. Dick," said my aunt; "what shall I do with this child?"

Mr. Dick considered, hesitated, brightened, and rejoined, "Have him measured for a suit of clothes directly."

"Mr. Dick," said my aunt triumphantly, "give me your hand, for your common sense is invaluable." Having shaken it with great cordiality, she pulled me toward her and said to Mr. Murdstone:

"You can go when you like; I'll take my chance with the boy. If he's all you say he is, at least I can do as much far him then, as you have done. But I don't believe a word of it."

"Miss Trotwood," rejoined Mr. Murdstone, shrugging his shoulders,

Better Than Spanking.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her today if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

HOW THIS WOMAN FOUND HEALTH

Would not give Lydia E. Pinkham's Vegetable Compound for All Rest of Medicine in the World.

Utica, Ohio.—"I suffered everything from a female weakness after baby came. I had numb spells and was dizzy, had black spots before my eyes, my back ached and I was so weak I could hardly stand up. My face was yellow, even my fingernails were colorless and I had displacement. I took Lydia E. Pinkham's Vegetable Compound and now I am stout, well and healthy. I can do all my own work and can walk to town and back and not get tired. I would not give your Vegetable Compound for all the rest of the medicines in the world. I tried doctor's medicines and they did me no good."—Mrs. MARY EARLEWINE, R.F.D. No.3, Utica, Ohio.

Another Case.

Nebo, Ill.—"I was bothered for ten years with female troubles and the doctors did not help me. I was so weak and nervous that I could not do my work and every month I had to spend a few days in bed. I read so many letters about Lydia E. Pinkham's Vegetable Compound curing female troubles that I got a bottle of it. It did me more good than anything else I ever took and now it has cured me. I feel better than I have for years and tell everybody what the Compound has done for me. I believe I would not be living to-day but for that."—Mrs. HETTIE GREENSTREET, Nebo, Illinois.

The Roofing that Needs No Painting

Amatite ROOFING

THE Amatite mineral surface will hold its own against the weather for a long time. You don't have to look over your Amatite Roofs to see whether they need painting every year or two.

The cost of paint, therefore, is done away with—all that trouble and nuisance and bother is gone. Simply lay your Amatite, nail it down, take away your ladder and forget that you have a roof.

A sample of Amatite will be sent free on request, together with a handsome little booklet, giving details. Address our nearest office.

Everjet Elastic Paint

A low-priced black paint—tough and durable. Stands heat so well that it can be used on boilers. For wood or metal, "rubber" roofings, fences, iron work, farm implements, tanks, etc.

States that she has been cured of

INDIGESTION

and Stomach trouble by the use of

Gates' Invigorating Syrup & Life of Man Bitters

after having been under the care of physicians without receiving benefit.

And although three years have passed has no returning symptoms.

She highly recommends these medicines to her friends and the public.

Sold everywhere at 50c. per bottle, $5.50 per dozen.

as he rose, "if you were a gentleman—"

"Bah! Stuff and nonsense!" said my aunt. "Don't talk to me!"

"How exquisitely polite!" exclaimed Miss Murdstone, rising. "Overpowering, really!"

"Do you think I don't know," said my aunt, turning a deaf ear to the sister, and continuing to address the brother, and to shake her head at him with infinite expression, "what kind of a life you must have led that poor, unhappy, misdirected baby? Do you think I don't know what a woeful day it was for the soft little creature when you first came in her way—smirking and making great eyes at her, I'll be bound, as if you couldn't say boh! to a goose.

"I never heard anything so elegant!" said Miss Murdstone.

"Do you think I can't understand you as well as if I had seen you," pursued my aunt, "now that I do see and hear you—which I tell you candidly, is anything but a pleasure to me? Oh yes, bless us! who so smooth and silky as Mr. Murdstone at first! The poor, benighted innocent had never seen such a man. He was made of sweetness. He worshipped her. He doted on her boy—tenderly doted on him! He was to be another father to him, and they were all to live together in a garden of roses, weren't they? Ugh! Get along with you, do!" said my aunt.

"I never heard anything like this person in my life!" exclaimed Miss Murdstone.

"And when you had made sure of the poor little fool," said my aunt—"God forgive me that I should call her so, and she gone where you won't go in a hurry—because you had not done wrong enough to her and hers, you must begin to train her, must you? begin to break her, like a poor caged bird, and wear her deluded life away, in teaching her to sing your notes?"

"This is either insanity or intoxication," said Miss Murdstone, in a perfect agony at not being able to turn the current of my aunt's address towards herself; "and my suspicion is that it's intoxication."

Miss Betsey, without taking the least notice of this interruption, continued to address herself to Mr. Murdstone as if there had been no such thing.

"Mr. Murdstone," she said, shaking her finger at him, "you were a tyrant to the simple baby, and you broke her heart. She was a loving baby—I know that; I knew it years before you ever saw her—and through the best part of her weakness you gave her the wounds she died of. There is the truth for your comfort, however you like it. And you and your instruments may make the most of it."

"Allow me to inquire, Miss Trotwood," interposed Miss Murdstone, "whom you are pleased to call, in a choice of words in which I am not experienced, my brother's instruments?"

Still stone-deaf to the voice, and utterly unmoved by it, Miss Betsey pursued her discourse.

"It was clear enough, as I have told you, years before you ever saw her—and why in the mysterious dispensations of Providence, you ever did see her, is more than humanity can comprehend—it was clear enough that the poor soft little thing would marry somebody, at some time or other; but I did hope it wouldn't have been as bad as it has turned out. That was the time, Mr. Murdstone, when she gave birth to her boy here," said my aunt; "to the poor child you sometimes tormented her through afterwards, which is a disagreeable remembrance, and makes the sight of him odious now. Aye, aye! you

Shorthorn Color Here and There

(Continued from page 87)

the countries mentioned. Admitting, however, that such is the case enough is positively known regarding changes which take place over very long areas when fresh blood is witheld for many generations, to prove the truth of the statements made in a very general sort of way. Now, even if there is no money in such speculations," it is interesting to discover reasons for just such changes. Can any one shed light on this subject?—J. V. Abingdon, Bexar County, Texas.

A few Facts About Sheep.

Sheep are practically immune to tuberculosis.

About fifteen different breeds of sheep are now recognized.

The nutritive value and digestibility af mutton rank quite high.

A pound of mutton can be produced at less cost than any other kind of meat.

Reliable statistics show that sheep are relatively free from diseases dangerous to man.

Of 14,208,724 sheep inspected for food purposes in 1912, only 15,402 were condemned, about one-tenth of one per cent.

One-tenth of these condemnations were due to caseous lymph-adenitis, a germ disease causing an inflammation of the lymph-glands.

Reasons for Rotations

At the basis of all genuine rotations lies the fact that plants differ from one another; they differ from one another in their demands upon the soil, both chemical and physical; they differ with regard to their root system, depth of feeling, their moisture requirements, their time of feeding, their dates in reaching maturity etc.

Many plants impoverish the soil; a few enrich it; some spoil its physical condition, while others improve it in that regard. Many crops favor the growth of weeds, while others either are able to hold the weeds in check or require such cultivation and treatment as will prevent their growth.

All these differences fit plants for different places in rotation, and a well-arranged rotation is one in which the strong points of one crop follow so as to fit into the weak points of another, or vice versa, and in this way reduce deficiencies to a minimum. A crop that requires a large amount of one element should be followed by one that requires less of that element and probably more of another. A shallow-rooted crop should be followed by one that is deeper rooted, so that plant food which may have escaped the shallower roots may be caught by the deeper feeder, and that the nutriment in the soil may be used to a greater depth. Crops that are exhaustive to the soil should be followed by a so-called soil restorer. And crops that are conducive to the growth of weeds should be followed by a weed-destroying crop.

Correction

Mr. John McMillan, Georges River Station, won the following prizes on his Southdowns at the recent Cape Breton Island exhibition held at Sydney: 1st ram lamb; 1st ewe, 2 years old and over; 1st and 2nd ewe lamb and 1st pen. He also won Kirk & Tory's special prize for the best two year or over ewe, any breed.

In our published list of prize winners the above prizes were inadvertedly credited to another breeder and we are taking this opportunity to make the correction public and give credit where credit is due.

To Prevent Chapped Skin

—use warm water and Baby's Own Soap.

The warm water opens the pores of the skin and the minute particles of pure refined vegetable oils which form the creamy, fragrant lather of Baby's Own Soap are absorbed into the skin, keeping it soft, healthy, and preventing cracks and chaps.

A perfect rinsing, then smart rubbing when drying guarantees a fine smooth skin in any weather.

BABY'S OWN SOAP

Best for Baby Best for You

Canada's Standard toilet and nursery soap for over 30 years.

WOMEN CURED AT HOME

Women's disorders always yield from the very beginning of the treatment to the mild, but effective, action of Orange Lily. Within two or three days after commencing its use the improvement becomes noticeable, and this improvement continues until the patient is completely cured. Orange Lily is an applied or local treatment, and acts directly on the womanly organs, removing the congestion, toning and strengthening the nerves, and restoring perfect circulation in the diseased parts. In order to convince all suffering women of the value of this remedy, I will send a 35-cent box, enough for ten days' treatment, absolutely FREE to each lady sending me her address. MRS. FRANCES E. CURRAH, Windsor, Ont. 6

For Sale By Leading Druggists Everywhere

The Art of Dying.

Now is the time that the cleverness of the housewife, or rather the mother, is made apparent by the gathering of articles of dress or wearing apparel and saving them from the housecleaning rubbish box.

In this house-cleaning time one will go through old trunks and boxes, discarding garments right and left, and with a last sigh for a frock that has done good service, throw them away with the other things that have accumulated during the year.

The wise woman will not do this. She will look these clothes over carefully and if the material seems good, she'll lay them aside for future use. Just because the dress has become faded, or lost its freshness, or the shade is out of fashion, is no sign that it has outlived its usefulness.

Many a woman can easily dress in the new shades and styles, without buying a single new thing. There may be changes in style since the old dress was worn, but these changes in style have no terrors for the thrifty woman who knows the possibilities of dyes. If the materials in last years clothes are seemingly good, but a little faded or soiled, she'll convert the color into one of the new, fashionable shades. And with a few up-to-date patterns she'll have new dresses, correct in style and color.

Remnants, that are real bargains, are on sale quite often in the different stores, the only reason for the low price being that the shade is out of fashion. Quite a saving in a new suit can be made by buying up such pieces and dyeing them to meet the dictates of fashion. If the material is wool or silk, a dye that is especially adapted to these materials should be used. If it is linen, cotton or mixed goods, a dye made for cotton will give the best results. It is as easy as washing a handkerchief to get handsome new shades by using dye suitable for the material to be dyed, and any woman with a little time and care can thus effect and immense saving in her dress bills.

The use of dyes for coloring trimmings to harmonize with a dress or suit is endless. With a little perseverence, the careful dyer can obtain any color or shade to match or blend with her gown, while faded hosiery, veils and feathers can be made to give longer service by using dye to brighten or change the color. Portieres, couch covers, table covers, and shadow curtains can also be given new life and added beauty and will fill the house-wife's heart with joy at the marvelous color schemes that can be carried out in her home with little expense.

There are a few precautions, however, that should be used before and during the dying process, but if the directions that are given with the dyes are closely followed, no one need have other than the best results.

The first thing to be done is to have all the garments or wearing apparel free from grease. Grease spots can be taken out with benzine and afterwards washed with warm soapsuds.

Now, remember that all dyeing should be done at a gentle boil, and use a vessel large enough for the proper manipulation of the goods. Be sure, though, that the dye is completely dissolved before putting it into the dye vessel.

Keep stirring the goods. Use a smooth round stick, such as a broom handle. Do not use anything sharp or pointed as it might tear the material. Turn the goods gently, completely and with absolute regularity. Many of the uneven results obtained occur through poor manipulation.

Under no circumstances rush the dyeing because the shade looks beautiful or deep enough, for all colors appear much darker when wet. Full shades usually require about an hour's boiling.

Remember, also, that all articles must be well washed in many changes of water after the dye, or until free from color. Otherwise the color may crock. Never dye a light color in a vessel which has had a dark color in it without first cleaning the vessel thoroughly.

Now a word about the colors. If the original color is white, any color can be dyed on it. If it is cream, it can be dyed any darker shade of simliar character.

Red can be dyed a darker red, crimson, wine, navy blue, brown or black.

Orange a darker orange, olive red, brown or balck.

Yellow a darker yellow, olive greens, orange, red or black.

Green a darker green, olive, brown, or black.

Blue a darker blue, navy, plum, dark brown, dark green or black.

Violet a darker violet, plum, olive green or black.

Brown a darker brown, wine color or black.

Grays can be dyed a darker shade, wine, maroon, navy blue, dark blue, green brown or black. Or if very light, lavender, pink, rose or baby blue.

Good judgment should be used in combining shades, for you cannot dye a light shade over a darker one without first stripping. Nor a light shade over a dull one. The number of shades which may be produced by mixing two or more colors is limitless. Many textile mills produce their whole range of shades from about eight or nine standard colors by mixing them in different proportions.

Home dyeing is quite a simple operation, and if the home dyer will only use good judgment and observe the precautions given above, failures will rarely occur.

The Art of Mending.

Mending is just as much of an art as making, and often the thrift of a family and the steady rise in the world is due to skill with which the mother makes and mends the garments for them all. A careless, unsightly patch ruins the best garment while a neat, almost invisible darn or new piece set in will add to its usefulness weeks and weeks. And it isn't such a difficult thing to mend well, if one is only determined to succeed. It takes patience and time and skill, to be sure, but once learned it becomes as fascinating as fancy work to the thrifty woman.

Darning stockings is almost a weekly occupation, yet many women never learn to do it well. If the hole is very large a new piece neatly whipped in, by using a stocking darner or door knob, is the best and quickest way of closing the gap, and it lasts longer than darning. Cut your patch exactly the right size and proceed to whip it in with small, firm stitches after it is sezurely blasted. When the rent is small long, even darning with single thread cotton such as is used for that purpose only will make the place very firm and durable.

For uneven rents in braod new garments a little piece of mending cloth, such as tailors use is the best thing Any tailor will sell you a fair sized piece for ten cents, and show you how to apply it. This is especially good for men's garments. For children an extra piece of thin goods applied underneath may be needed to stregthen the weak parts, and if the hole is very large the entire piece should be replaced by a new one. This sounds formidable, but really it is easier to make a new sleeve and put it in, than to try to darn a zig-zag rent made by a nail or oyther projettion.

In every day garments the extreme care need not be used as no one objects to a patch on a working apron or petticoat. These may first be basted in place and then rapidly sewed on the machine, leaving the leisure time for better clothes. Of course school -clothes and afternoon garments will require skill and matching make them look right, but for everyday undergarments and working clothes the sewing machine is a great help in patching. In factory underwear no attempt should ever be made to patch with muslin, for when it is washed it is dreadful. Use pieces of old knit garments and carefully cut the patch to conform with the worn place. By so doing you will insure a neat fit, and the garment will last twice as long as if thrown together. The stitching, after it is carefully fitted, may be done on the machine, but only after it is fitted.

Such small items as buttons in place, button holes kept from getting too large and a stitch or two missing here and there are best done after the weekly ironing. To pin bands together is to wear them out rapidly, while to have every button and hook and eye in place adds to the neat appearance of the garment, and also prolongs its life. Early in her housekeeping career every woman should resolve to know how to mend in as nearly perfect a manner as possible, for in so doing, she will save many dollars, as well, as make her home more enjoyable.

Good Music for Home.

I will not attempt to say whether it should be piano or organ, or something much less pretentious, or whether singing alone may best provide the musical turns for the family, but music has its place and should be so recognized in every household. There is something about vocal music that goes much deeper than the words or sentiments of the songs. Family singing, according to one musical composer, is going out of fashion, and this he deplores greatly.

Because it carries four parts the piano or the organ is a little ahead of the smaller stringed or wind instruments, although in good hands the guitar, mandolin or or the violin can send out strains that tell their stories not less powerfully than the larger instruments. Having only one part, some of these are easier to play, a quality which will doubtless appeal to many.

The music need not be elaborate; it need not even be classical. There is plenty of material, not too difficult, yet full of character and sweetness, that is easily mastered and does well for the part music fills in the home life. We play mostly for our friends, many of whom are not "musical," and none will be over critical. And in the home we are not playing to big audiences or to weighed up by the gossips or the newspapers. Simple compositions, even of the easiest grade, if played in correct time and with delicate feeling, are more pleasing than 'studies'' which are plainly beyond our scope, or which are half-way done. Then, again, some of the most beautiful of the musical classics are not at all difficult.

Songs will naturally enter largely into the home repertoire, and just as naturally the ones best liked will be the ones having the most real musiccal merit, for really good music is sure to find its place. It is not necessary to go backward for what is good, but it is true that many of the old time songs are better than some which have come and gone since then. It would be hard to specify what to avoid in music, but what is pleasing to hear, and at the same time of a nature that will wear well, may be classed as good music.

The quality of music, as some people appear not to know, does not at all depend upon the words it accompanies. Yet we so much associate words with music that we often admire the tunes for the words. It is the occasional piece that, unaccompanied by words, stirs emotions, and in this the real force of music shows itself. Much, one might almost say all, depend on the skillful player and the literal accuracy of time. It is this that sways big audiences, or carries the soldier eagerly to battle.

PILES CURED at HOME by New Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write to-day to Mrs. M. Summers, Box P. 309, Windsor, Ont.

NEW COAL OIL LIGHT BEATS ELECTRIC OR GASOLINE

10 Days FREE—Send No Money

We don't ask you to pay us a cent until you have used this wonderful modern light in your own home for ten days, then you may return it at our expense if not perfectly satisfied. We want you to prove for yourself that it gives five to fifteen times as much light as the ordinary oil lamp; beats electric, gasoline or acetylene. Lights and is put out just like the old oil lamp;

BURNS 70 HOURS ON 1 GALLON OIL

Gives a powerful white light, burns common coal oil (kerosene), no odor, smoke or noise, simple, clean, won't explode. Guaranteed.

$1000.00 Reward

will be given to the person who shows us an oil lamp equal to this **Aladdin** in every way (details of offer given in our circular). Would we dare make such a challenge to the world if there was the slightest doubt as to the merits of the **Aladdin?** We want **one person in each locality** to whom we can refer customers. Write quick for our 10 Day Absolutely Free Trial Proposition, Agents' Wholesale Prices, and learn how to get **ONE FREE.**

AGENTS WANTED

to demonstrate in territory where oil lamps are in use. Experience unnecessary. Many agents average five sales a day and make $300.00 per month. One farmer cleared over $300.00 in 6 weeks. You can make money evenings and spare time. Write quick for territory and sample.

Dr. Morse's Indian Root Pills

are just the right medicine for the children. When they are constipated —when their kidneys are out of order —when over-indulgence in some favorite food gives them indigestion —Dr. Morse's Indian Root Pills will quickly and surely put them right. Purely vegetable, they neither sicken, weaken or gripe, like harsh purgatives. Guard your children's health by always keeping a box of Dr. Morse's Indian Root Pills in the house, They 51

Keep the Children Well

The Bathroom.

Much of the mustiness of a bathroom arises from the stale bath water that has trickled down the inner sides of the wooden casing, which, with gathered dust, has dried there. These casings are best if constructed in adjustable parts that can be easily removed for regular cleaning, and refixed afterwards. They are generally only painted or stained and varnished on the outside, which soon perishes and gives the bathroom an uninviting appearance, which should, however, always be bright and clean. There is no good reason why both sides of the woodwork should not be enamelled, as that not only makes it impervious to water, but easily kept in a clean, sweet and bright condition. Even if the top be of mahogany the under side is all the better it enamelled, keeping the upper French polished, as the bare wood in patches is most unsightly. But the most cleanly way with a bath is to remove all the wood casing, giving the outside of the bath a coat or two of paint, and then one of enamel of cherry colour. Even the top can often with advantage be dispensed with. This plan transforms the bath like to the newer kinds now being fitted, enamelled inside and outside, fixed to stand alone without wood of any kind, not a very expensive business if taken in hand and done properly.

Brass Bedsteads.

These may be cleaned by rubbing them with a cloth slightly moistened with sweet oil, and then polishing them with a soft, dry duster, and lastly with a chamois leather. This will, if done occasionally, keep them in good condition for years. Wooden bedsteads should be wiped over every three months with a cloth moistened with turpentine to keep them clean.

To remove tar marks, rub a little butter on the spot and allow it to stand until the tar is softened, when it will wash out with warm water and soap. To clean a dark costume, sponge with cold tea to which a small lump of ammonia has been added. This also answers admirably for men's and boy's suits. To remove egg-stains easily from table linen, soak in cold water before placing in hot soda and soap.

Toe-Capped Boots.

It is astonishing how much discomfort and even torture some people will endure from ill-fitting footwear for the sake of "being in the fashion." Very few people can with any comfort wear capped boots or shoes, and for most they are the forerunners of many feet troubles. Hard corns and in-growing toenails more often arise from wearing toe-capped boots than from other causes. If one's toes are boxed in a double thickness of leather, and lining stiffened by a stitched seam, it stands to reason that free- and easy movement is impossible, consequently painful corns and ugly feet distortions must result. Besides, the compression pinches the "ball" of the foot, causing a painful hard corn to come, which the sufferer gets acquainted with when stepping on some sharp substance. And it is not easily eradicated. Capless foorwear, anyway, is best for plump feet, and children's should always be so with plenty of breadth to allow of expansion and freedom when walking, and for proper natural growth, should be worn so that the ankles get plenty of fresh air, and in the case of hot, humid feet, to allow of proper ventilation and evaporation of moisture.

Her HEART and NERVES

Were So Bad She Could Not Sleep.

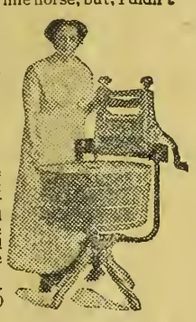
To those who sleep in a kind of a way, but whose rest is broken into by fearful dreams, nightmares, sinking and smothering sensations, who wake in the morning as tired as when they went to bed, we can recommend Milburn's Heart and Nerve Pills. By taking them you can have your old, peaceful, undisturbed, refreshing sleep back again.

Mrs. Chas. Teel, Horncastle, Ont., writes:—"Just a few lines to let you know what Milburn's Heart and Nerve Pills did for me. My heart and nerves were so bad I could not sleep, and the least noise or excitement would make me feel so that I used to think I was going to die, and I would tremble until I could hardly stand. I took doctor's medicine, but it did not do me much good. At last I tried Milburn's Heart and Nerve Pills, and I can certainly say they did me a great amount of good. I can recommend them to anyone who is suffering as I was."

Milburn's Heart and Nerve Pills are 50c. per box, 3 boxes for $1.25 at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

THIS WASHER MUST PAY FOR ITSELF.

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse, but, I didn't know anything about horses much. And I didn't know the man very well either.



So I told him I wanted to try the horse for a month. He said "All right," but pay me first, and I'll give you back your money if the horse isn't all right."

Well, I didn't like that. I was afraid the horse was'nt "all right" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse, although I wanted it badly. Now, this set me thinking.

You see I make Washing Machines—the "1900 Gravity" Washer.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me. You see I sell my Washing Machines by mail. I have sold over half a million that way. So, thought I, it is only fair enough to let people try my Washing Machines for a month, before they pay for them, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six Minutes. I know no other machine ever invented can do that, without wearing the clothes. Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman, and it don't wear the clothes, fray the edges, nor break buttons, the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first, and I'll make good the offer every time.

Let me send you a "1900 Gravity" Washer on a month's free trial. I'll pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight too. Surely that is fair enough, isn't it.

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months in wear and tear on the clothes alone. And then it will save 50 to 75 cents a week over that in washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week, send me 50 cents a week till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line to-day, and let me send you a book about the "1900 Gravity" Washer that washes clothes in six minutes.

Address Me Personally

G. G. Morris, Mgr. 1900 Washer Co.

57 Yonge Street, Toronto.

Boots, if tightly laced or buttoned, prevent this, which is unhealthy, making the feet tender, besides lessening the life of the boots.

The Bashful Child.

Too many mothers scold and feel aggrieved when their children are shy and awkward in the presence of friends or strangers instead of recognizing bashfulness as a disease and trying to cure it. If you have never been timid yourself, you cannot understand the agony that your poor child suffers. No matter if you have drilled and lectured and threatened about good behaviour countless times, the bashful boy does not know his right hand from his left, and his tongue refuses to act when you want him to apper easy and polite. Scolding only makes matters worse, and punishing is a crime.

First of all never allow timid children to be teased about their infirmities. If Willie shakes hands with the wrong hand or Mary makes a blundering speech when you admonish her to "be sociable" in the presence of company, let both pass unnoticed. If a guest should do something awkward you would use every bit of tact you possessed to make him forget it, so why retail the blunders of the timid children to the rest of the family, or permit other children to taunt them. Suppose you upset a vase or ruined the table cloth accidentally, would you want to hear about it and be laughed at even by your best friends? Use common politeness in the home life as well as in dealing with strangers.

Clothes play an important part in making children free and easy at home and abroad. Put a shabby, ill-fitting dress on the nicest little girl in the world and she will immediately become awkward and shy. Bashful boys and girls should always be dressed in neat, inconspicious clothes, and should be entirely unconscious of what they wear. It is just as easy to make clothes to fit as to spoil them in these days of cheap and accurate patterns, but some mothers do not seem to think so. It is bad enough for the tom boy of the family, who cares nothing for clothes, to be sent to school or church in a clumsy, unbecoming frock, but the bashful girl suffers tortures when compelled to wear garments that attract attention.

One mother transformed her bashful little ones into polite, but not forward, boys and girls by playing "come to see" with them day after day. She never hinted why she was playing the game, but patiently took turns with the children in being hostess and serving refreshments and being polite to callers until gradually she knew the agony was over for her little folks when friends or strangers called. Even the smallest could open the door, shake hanhs, draw up a chair for the guest and modestly carry on a conversation. Don't you think that mother felt repaid for the time she spent playing with her children? And don't you think she is much happier and better satisfied than her neighbor who pronounced that plan "all nonsense" and punished her timid children for their blunders? If you could see both families you would see a difference at a glance.

Never forget to praise the boys and girls for every correct expression and deed. It is safe to be looking at the wall or out of doors when some little break occurs, but never miss the things that are done and said at the right time. A word of praise lingers a long time and the mother who is alert in seeing the things she ought to see can do what she will with her boys and girls. A little girl who was scolded and laughed at at home for years because she was timid and awkward suddenly had a new world unfolded before her astonished eyes when a tactful aunt with whom she spent a year showed her the beauty of good manners. She had received the impression at home that being polite was a hard task, but her aunt taught her, not by word but by example, that happiness depends upon kindness to others and that good are nothing more than the outward da Richmond.

Saw Your Neighbors' Wood

IN that way you can make the Renfrew Standard gasoline engine pay for itself. You can readily get from $7.50 to $12.00 per day for your engine and your own services. Your expenses would not exceed $1.50 per day for gasoline and oil. That gives you a net $6.00 to $10.00 profit for a day's sawing. One of our customers made $350.00 in six weeks, and another customer, with a small-sized engine, made $175.00 in thirty days. You can do the same.

Renfrew Standard
It starts without cranking

The Renfrew Standard Portable Sawing Outfit shown above is the handiest, most efficient sawing outfit on the market. Besides being simply unequalled for sawing cord wood, fence posts, poles, etc., it can also be used for any other purpose that a regular portable engine can be used for.

Like all other Renfrew Standard engines it starts without cranking in cold or warm, rainy or snowy, weather. It can be regulated to any desired speed without stopping the engine. Has a governor of the fly-ball steam-engine type, a remarkably simple carburetor, and large bearings. Built throughout of the best materials and with absolute accuracy. No finer engine on the market—and none so simple or so easy to run.

Write for booklet giving complete description.

FLORICULTURE.

H. A. H., Amherst, Writes;—How late can I wait before planting bulbs?

The planting can be done any time before the ground freezes up. But better results wil be obtained by having all bulbs planted by the last of October. The longer the bulbs are exposed to the air the lower becomes their vitality. Such hardy bulbs as Crocus, Scillias and Narcissus in varieties should also be planted among shrubbery, along fences and in corners of your garden to be come naturalized and form permanent clumps, in a few years that will give you every spring an abundance of fragrant blooms for a long period before any other class of plants have hardly commenced growth. Another way of ultilizing these two dwarf species of hardy bulbs, Crocus and Scillias, is to plant them on the lawn. They may be planted in lines, geometrical designs, names, etc., and all sure to come up in early spring showing perfectly the lines desired and increasing every year, in number and beauty and lasting a long time in bloom.

As many men readers of the Floral Notes have enquired about the proper method of planting care etc., etc., of hardy bulbs I will repeat instructions for their benefit. All soil should be well drained, that is, no water should stand on or around the bulbs. If the natural position will not afford good drainage it must be provided as bulbs will not stand stagnant water. Never spade in green manure or any fermenting substance for a fertilizer in the soil—use only old, well rotted fertilizer. If you do not have that plant the bulbs in the clear soil and use for a covering in winter a coarse strong manure to a depth of six inches or more not placed on the beds until the soil has been frozen two or three inches. The backing of this covering will give all the fertilizer needed. I use this method to fertilize my beds. In planting dig up and fertilize the soil. Plant the tulips five inches a part and five inches deep, Narcissus the same, Crocus and Scilias three inches a part and two inches deep. Press the soil firmly over the bulb in planting, when planted in light soil. In heavy soil press lightly. When planting bulbs in heavy soil (clay) a handful of sand under each bulb will assist it in rooting and often the same attention in planting on badly drained soil will give good results. As before stated do not cover your bulb beds until late in autumn after the soil commences to freeze; when they will repay the trouble of a good mulch not to be taken off—again—until the frost commences to leave the soil in spring, after which it must be at once removed.

St. John, N. B., writes;—Can you explain why a large plant of Begonia sheds its leaves without anv apparent cause? I have had it about six years and every now and again it sheds all its leaves. There is no regularity about it. I take the best of care of it and it never gets dried out.

If correspondent would send Begonia leaf and size of pot, nature of past treatment as regards watering, light, etc., I will be very glad to answer question to the best of my knowledge.

Caladenius bulbs should be thoroughly dried off now for the season also Tuberous Rooted Begonias. Keep them thoroughly dry. They are easily kept in clean dry sand.

If you intend to force some pots of Spire for Easter it would be well to have the roots dug up in the fall before the ground freezes and stored in an out building where they can remain frozen until time for potting, which is well to the last of December this year, and should be forced as fast as possible after the little green leaves begin to show. Easter comes earlier next year. They are one of the strong plants for Easter so green and such white spikes of flowers that last so long.

If you have stored some soil for potting during the winter keep it in a moist place and do not let it dry up for in that condition it loses a much larger percentage of its ammonia than it would if moist.

Hampton sends asparagus leaf.

The frond of aspargus received does not show any disease. Turn the ball of soil out of the pot, if roots are crowded repot it. See that the drainage is perfect and keep moist. Cut out all dead wood. No insect appears to have troubled it. Spray foliage often. Do not use soot on pot plants but save it for the garden and use manure water instead. The trouble with the orange tree referred to is that it is probably so crowded with roots that water fails to penetrate to the lower roots. Repot it at once and if the ball is dry give a good soaking up. Cut out all dead wood. Give good drainage and if the roots, crown and stem are healthly it will soon make new branches. Soft wood ashes have some value as a fertilizer but owing to the small amount of potash and phosphoric acid they contain compared with hard wood ashes the difference in value is in favor of hard wood ashes. Both are valuable fertilizers especially on light soils that are usually deficient in potash. Charcoal itself is not a fertilizer but owing to its absorbent properties in useful in taking up readily free plant food in the soil and yielding it readily again to roots of plants. Its value is wholly mechanical. A large percentage of charcoal being carbon many think it useful as plant food but all the carbon used by plants is taken from the atmosphere through the foleage.

Amateur, Hampton, writes;—Regarding the plot of ground for lawn mentioned in my last communication it is quite sunny and the soil is quite dry and also very good soil. Would it not be better to have it dug over this fall and have all weeds removed? Please name grass seed and quantity required for plot forty by sixty feet.

By all means dig up lawn this fall and if you can remove weeds do so. Weeds are usually easier removed in spring after the water has rotted the sod. You will require six pounds of grass seed mixed in the following proportions:— 1lb.—Rhode Island bent grass seed, 1 lb. fancy red top grass seed, 1 lb. white Rutch clover—mix thoroughly before sowing and roll well after sowing.

Chatham, Writes:—If not to late please tell me how to plant shrubs and vines? I have an old lawn on which I am desirous of planting shrubs and also to cover an old shed with five fingered Ivy.

To plant shrubs on lawn you should make beds first, as you would flower beds, large enough to take the desired quantity of shrubs. It is a good time to plant them in the fall, any time before the ground freezes, so the soil will get nicely settled before the ground freezes. The making of beds for shrubs and vines is universal plow where good work is done. Shrubs cannot be successfully grown in sod.

Yes, your Freesias, Paper White Narcissus and Roman Hyacinths should be planted early so by the middle of November they can be taken up to the sunshine. If they are well rooted give them plenty of water and a cool situation.

Early Azalias should be fed from now on until flowering. Use Smaller doses of fertilizer than for Geraniums or other quick growing plants. Frequentspraying is also essential to the wellfare of these plants.

Watch the insects on your plants. Washing and spraying once a week with castile soap and water is a prevention of insect trouble and keeps the plants clean.

Don't forget to separate all hardy plants this month whose roots are crowding each other. Paeonies do well when transplanted in the fall as soon as the leaves begin to fall and the stalks dry up.

Anxious Writer, says:—I have a large Honey suckle by my house. I want to remove it but cannot without cutting the roots badly. Should the stalks be pruned to that extent? By all means prune the top of the vines severely if the roots have been partly destroyed.

The Iris.

Hampton, N. B. writes:—Tell me about the Iris. Are they hardy or good for early flowering? I want something that does not need much care.

The Iris are among the most beautiful of our hardy plants for early summer flowering and are destined to become as popular as the hardy Phlox and Paeonies. They are valuable not only as decorative flowering subjects for garden but are also very useful as cut flowers.

While generally a deep wet position is recommended for them, we have had far more satisfactory results where we have grown them in deeply cultivated, well drained ground, which has been well enriched with animal manure and where an abundance of water has been applied during their growing season and particularly during their flowering period. The choice standard varieties are Cherion Lilac, Mauve; Edith, Light Plumbago Blue; Honorabills Golden

FREE Grand 28-Piece Scholar's Outfit and a Dandy Big Camera

THE GREATEST PREMIUM IN CANADA—EASY TO GET

BOYS AND GIRLS—We want to give you, without a cent of cost, this magnificent scholar's outfit, so complete and handsome that you will be the pride of the school. **JUST READ WHAT EACH OUTFIT CONTAINS**—One high grade largest size English school bag, one fine Royal fountain pen with three extra gold finished nibs, one all steel, silver-finished pen knife, one combination eafety pen and pencil, a big, complete printing outfit with six rows of type, one dozen (12) high-grade lead pencils, a fine pencil box with lock and key, a microscope or magnifying glass, one box of fine crayons, one tin box of fine paints containiug 26 colors, one horse-shoe magnet, one school compass, one 12 inch ruler, and last, but not least, a fine eraser. This is just simply the chance of your life to get the finest scholars' outfit that was ever offered, 28 big costly articles, as easy as can be.

Now if you want this wonderful outfit, and a fine big Ensign camera as well, write us today and get by return of mail, just 32 Hearts of Flowers, the great **PARISIAN PERFUME,** to sell among your friends at only 10 cents each. They go like hot cakes. Everybody wants this delightful new perfume — eight delicious odors, Beauty Rose, Lily of the Valley, Wood Violet, Carnation, etc., and our big ten cent size will perfume more articles than a dollar's worth of ordinary perfume. It won't take you five minutes to sell them all. Then return our $3.20 and the Complete Scholar's Outfit—every piece exactly as you see it above—will be sent to you complete. We want to introduce this great new perfume to every lady in the land, and are sparing no expense to do so. When you get your beautiful Scholar's Outfit show it to all your friends. Get only four of them to sell our grand perfumes and earn our premiums as you have done, and we will also give you this beautiful, big, genuine Ensign Camera as an extra present. We arrange to stand payment of all transportation charges.

Don't miss this chance. Write today. Be first. Address

Yellow, changes to rich mahogany brown; Lord Salisbury Standard, amber; White Falls dark violet or purple. They can be planted early in spring or late in the fall before the ground closes.

PERENNIAL PHLOX.

The hardy Phlox comes next in value. They are of the most gorgeous of flowering summer plants in the world having the collections while not extensive embraces all the distinct newer varieties as well as the standard sorts. Many varieties which heretofore have been scarce and high priced are now available in large quantities and at regular prices. They require little or no care after once getting them into the ground and they increase very rapidly from year to year. Among the new varieties of Hardy Phlox is the Asia, tall, a shade of mauve with crimson eye Barga, dwarf, mauve rose with white eys; Europa, tall, white variety with very decided crimson carmine eye. There are eight varieties all running in this line, very beautiful and lasting a long time while in bloom. Brush and old strawey manure are some of the best of coverings from the middle of December after the ground freezes to hold them from the winds.

Oats as a Concentrated Feed.

Chemical analysis of the varieties of oats during the past three years reveals many interesting facts relative to the variability in per cent of protein, carbohydrates and fat in this plant.

Among the varieties of oats tested in 1910 there are marked differences in the composition of the grain. The percentage of protein varies from 13 to 18 p.c., and the calculated yield of protein ranges from 248 to 426 pounds per acre. The percentage of carbohydrates ranged from 57 to 60 p.c., and the yield of carbohydrates carried from 908 pounds to 1400 pounds per acre. The percentage of ether extract, which comprises the fats, varies from 3.9 to 6.75 p.c., giving a yield of 67 to 143 pounds per acre. These 16 varieties of oats yielded from 46 to 73 bushels per acre.

Among 14 varieties of oats tested in 1911, of which 13 varieties were in the tests of 1910, similiar variations in composition exist. The yield of these 14 varieties grown in 1911 ranged from 37 bushels to 62 bushels per acre, the average being 48 bushels, as compared with 64 bushels produced in 1910. This marked decrease in the average yield of varieties in 1911 was undoubtedly due to the conditions of that season which were less favorable than the season of 1910 to the growth of oats.

The variety of oats which contained the highest percentage of protein, namely 18 p.c., in 1910 was the Early Champion. This oats contained 19 p. c. protein in the 1911 crop. The Early Champion contained 59 p.c. of carbohydrates in 1910; 57 p.c. in 1911.

It is clear that oats may be a high producer measured in bushels of grain per acre and yet not contain a high percentage of protein. However, some of the varieties in the tests made at Highmoor during the past three years are high producers of grain and also give a comparatively high yield of protein per acre. For example, the variety which yielded the most grain per acre (73 bushels) in 1910 gave the largest amount of protein, namely 426 pounds. This variety of oats, according to analysis, contained 18 p.c. protein.

From the above figures we must realize the variability in composition that exists between varieties of oats. This is of considerable value to the farmer. It suggests the advisability of procuring varieties of oats which have the highest protein content as well as the capacity for high yields of grain. An oats containing a high percentage of protein and also a fair content of carbohydrates and fats is obviously a valuable feed.

On good soil carefully plowed and prepared it is comparatively easy to obtain an average yield of 50 bushels of oats per acre. By using good varieties of seed it is possible to grow 60 to 65 bushels per acre under ordinarily good farming conditions. A ton of grain per acre containing relatively high percentages of protein and other food compounds makes a cheaply produced and fairly concentrated feeding stuff for farm stock.

The Care of Harness.

It is worthy of note, apart from a matter of comfort, how much more work can be done by a horse with properly fitting harness that is kept in good condition, than with any clumsy collar that seems to have just been thrown on and fits where it touches. Just imagine the discomfort to a small man having to wear a large man's clothes and work in them all day, or a large man working in small man's clothes. It makes a great difference whether harness is kept soft and pliable, hard or rough, whether it fits snugly or not. There are more horses permanently injured by badly fitting harness than most people are aware of. Harness should be kept in a dry place when it is finished with. Generally in the spring, when all the work seems to come on at once and all the horses available are required, some collars, etc., are brought out that were put away perhaps the previous autumn; if these were well cleaned and oiled before being put away they will be found to be soft and pliable, but if not, and they are hard, rough and probably damp, it is nothing short of cruelty to put such like on any horse, let alone on a young one that is about to be hitched for the first time perhaps. The oily surface of the leather and the sweat from the animals causes the dust to adhere to it, and thus make it dry and uncomfortable. First wash all this off and then before really dry apply the oil and work it into the leather as much as possible. Neats-foot oil answers this purpose well, but there are several excellent harness oils advertised that are worth using, after which place the harness out of doors, and then when dry rub clean. When harness has been unavoidably made wet it should be partly dried and rubbed over, then oiled before it has the chance to get hard; by doing this it will be found to last much longer.—Harness and Saddlery.

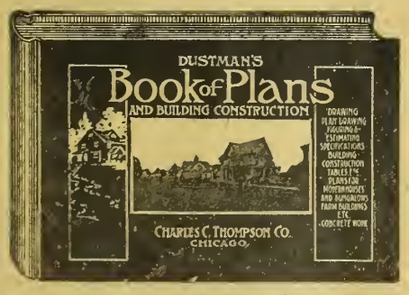
Storing Late Cabbage.

Place the cabbages close together in a single layer, head down, on the ground in a well-drained location and cover the cornstalks, setting the stalks on end and inclining them so as to cover the cabbages. Make the pile narrow enough so that the tops of the cornstalks will overlap from either side and put the stalks on good and thick to keep the temperature even, then shovel some soil up around the base of the pile and lay a few boards on top to hold the stalks in place.

It is not necessary to keep out the frost, but the cabbages should not freeze solid and constant freezing and thawing may cause them to rot. A temperature as near the freezing point as possible all the time is what is desired. Storing the cabbages on the north side of the building will help to keep the temperature constant, but they should be out of the way of water from the eaves.

Where it is not possible to get cornstalks, straw might be used for covering the cabbages, though it is not so good as the stalks. A thin layer of straw on the ground under the cabbages will help to keep them clean.



Dustman's Book of Plans *and* Building Construction

By U. M. DUSTMAN, (*Licensed Architect*)

10,000 Sold in 30 Days

Price $2.00 Prepaid

Here's a different book from those upon the market. It contains information not generally known outside the building trades; just such information which the building public want. The author has written a book in which he has embodied the cream of over thirty years successful experience. He is widely known as a practical and expert architect and is an authority on the construction of medium priced homes.

Every one interested directly or indirectly in building should have this book. 250 pages; oblong size, 9x13 inches; bound in blue cloth; white hand stamping—150 plans for modern houses, bungalows, barns, farm buildings, store fronts, store buildings, garages, etc., etc.

CONTENTS: General Construction Plans—Arrangement of Rooms—Things to be Considered in Laying out a building—Heating Facilities—How to Estimate Cost—Figuring Amount of Material Required—Time Saving Tables—Mechanical Drawing and How it is Applied in Construction of a Building—Plans with Estimated Cost of 150 Houses, Bungalows Barns, in Frame, Concrete or Brick Construction—Country Houses—General Barns, Cattle and Horse Stables—Dairy Barns—Poultry Houses and Silos—Hints as to Best Style of Structure—Details of Interior Construction and Finish—Window and Door Framing—Stairways—Store Fronts—Roof Construction—General Directions For Mixing and Placing Concrete—Proportions—Sand and Gravel—Itamized List of Material Costs—Writing of Specifications.

This book will be sent, together with a year's subscription to THE MARITIME FARMER to any person upon receipt of $2.00. That is if you are already a subscriber and will send us two dollars we will send you the book and give you credit for one year's subscription. If you are not already a subscriber and want the book, you may obtain it and THE MARITIME FARMER for $2.00 These books cannot be purchased anywhere for less than $2.00 each and they are a bargain at the price.

THE MARITIME FARMER, SUSSEX, N. B.

Udder Troubles Among Ewes.

In some seasons more than others the shepherd has trouble in the shape of bad udders among his lambing ewes. There is recognized on the continent an infectious mammitis of ewes, a septic disorder, a form of which is greatly on the increase in this country among dairy cows, but does not, so far as we are aware, affect sheep, and it may generally be taken that when several cases of bad udders occur in a flock they are not due to infection or contagion, but to the exposure of the whole of the animals to similar unfavorable conditions.

THE CAUSES OF UDDER TROUBLES.

The causes are somewhat numerous; some cannot be guarded against, others are due to sheer carelessness or neglect. They include the effects of cold and wet consequent on exposure, especially when night frosts prevail; the dirt and moisture of badly-bedded folds and yards, bruising of the distended udder on hard ground, or from the head of the lamb when sucking, and inflammation consequent on retention of milk—perhaps the most fertile of all the causes of mammitis in ewes. Udders sometimes become what the shepherd calls "caked," and the lamb cannot get the milk away. It is, of course, always desirable that the cause in operation should, if possible, be elucidated, because on its avoidance depends prevention in other cases, and on its removal the success or otherwise of treatment.

TREATMENT OF UDDER TROUBLES.

It is desirable that this should be suitable and prompt, because it has a most important bearing on the terminations and complications, and the earlier and more assiduous the treatment the better the chance of the only favourable termination, which is known technically as resolution—that is, complete recovery or restoration of function. Unfortunately this termination is the most rare, mammitis in the ewe often resulting in gangrene or mortification, and sometimes in the death of the ewe, as well as the death of the part. The frequency of this termination, as compared with induration or atrophy, which are the most common termination in cows, is said to be because the absence of close supervision, which milking twice a day provides for in the cow, results in the disease getting a long start. The first step is to get the affected animal under cover on a dry, clean bed, and where it can receive frequent attention without chasing it all over the place. The gland should be fomented freely and frequently with hot water, or, in the alternative, poulticed. Poulticing is very useful if the animal has frequent attention and the heat and moisture, which is the essence of poulticing, is properly applied.

Lambs able to suck should be kept at the teats if possible, as the drainage of the gland in the unaffected portion is a matter of some consequence affecting a cure; otherwise everything possible should be got from the teats by hand milking.

Camphor is the best deobstruent we have, and in the form of camphor liniment—popularly, camphorated oil—should be used freely to rub or massage the gland after fomentation. A full dose of Epsom salts is generally useful; it helps to keep down the temperature as well as opens the bowels. While the strength of the ewe should be maintained, milk-producing foods should be avoided, and the lamb otherwise provided for. This treatment should be persevered in until it is seen to be of no avail, and that one of the unfavorable sequence—induration, atrophy, suppuration, or mortification—must result, when it must be charged to suit the circumstances of the partirular case, for it is rare that any two cases of ovine mammitis run exactly the same course.—Pately Bridge.

Hog Notes.

The more pigs a sow has, the more feed she needs.

The older pigs grow, the more food it will take to make a pound of gain.

Young sows that do well with their first litters may be considered good breeding sows.

The health, thrift and growth of swine are best and most economically secured in a clover field.

With pigs as with all other young stock, sweet food is preferable to that which is fermented or soured.

Hogs may be fed out in winter to a good advantage if there is warm and dry shelter kept perfectly clean.

Usually pigs from large litters are more thrifty than those from small litters and are better feeders.

A good thing about the hog is that he may be able to utilize much of the wastes of the farm and orchard.

The easier feed is digested the greater the gain made from it. The more hogs can be made to eat in a certain time the more profit.

The hog is raised only for its meat and this being the case, the object is best subserved by turning into meat as soon as possible.

A short snout and a long back make a good hog combination. Then feed for growth and not for fat until it is time to fatten.

It is less expensive and more satisfactory in every way to keep the boar in a good thrifty condition rather than stuff him to get him fat.

If a sow is known not to be a good milker, she should be fed a laxative ration some time before farrowing, and on through until she weans her pigs.

The fattening hogs should have warm shelter and protection from storms, as it will require more grain to finish them off. Besides, they will not grow so rapidly.

When pigs are weaned early they should be taught to eat as soon as possible, otherwise they are apt to suffer from the change in diet and lose in weight, which means a checking in growth.

There is one particular virtue about pigs which makes them emphatically the stock for the poor man to grow, and that is the very quick returns which they afford by the rapidity with which they increase and come to maturity.

The hogs should have all of the grain that they will eat up clean now but no more should be given at any time that will be eaten up clean and quickly.

Topdressing Old Mowings.

Editor The Maritime Farmer.

In topdressing old mowings, what percentage of the fertilizer do we loose by bleaching, etc.?

G. Frank Cann,
Yarmouth Co., N. S.

The percentage of loss in top dressing such land as you speak of is practically nil.

Bleaching does not affect the fertilizer quality in the least. Bleaching affects it very little if the top dressing is given early enough after the frost has begun to go in the spring, or even if top dressed in winter provided the land is fairly flat.

We will make you a suit for $12.50 in London, Eng., That would cost you $25.00 in Canada

You've heard that clothes are cheap in England. You know, too, that English woolens are the best in the world.
But do you know that many thousand Canadians buy their clothes every year direct from us in London—and save about one-half of what they would have to pay if they bought them locally ?
The reason for it is this :—Being the largest firm of Mail Order Tailors in London, we are able to take the whole output of many big mills. By doing this, we save all middlemen's profits, and so are able to sell you a suit and pay all duty and carriage charges upon it for a price about one-half what you would have to pay in Canada.
To prove to you that this is so, we will, upon receipt of the coupon filled in by you, send—**Absolutely Free of Charge**—our latest Style Book, 72 pattern pieces of fine English suitings, a letter explaining our system of doing business, and a self-measurement chart so simple that you can't go wrong in using it.
Now isn't that a proposition worth while looking into ?
It doesn't cost you anything, and it may save you a whole lot of money.
Sit down right now—fill out the coupon, mail it, get the samples, and be convinced.
If you don't want to cut this paper, we will send you the samples anyway, provided you write and mention this paper, but to get them you **must mention Sussex Maritime Farmer.**

CATESBY'S LIMITED,

(Of Tottenham Court Road, London, England.)

119 West Wellington Street, Toronto.

The **"Burlington."**—This shows the most popular style of suit worn by well-dressed men in Canada. The materials used are specially selected for this shape of suit.

MESSRS- CATESBYS LIMITED (of London),
Dept. "H." 119 West Wellington St., Toronto, Ont.:
Please send me your new season's Style Book and 72 pattern pieces of cloth. I am thinking of buying a suit—overcoat. ×

Full Name.....

Full Address.....

× If you only want overcoat patterns, cross out the word "suit." If you only want suitings, cross out "overcoat."

Maritime Farmer. Coupon No. 2.

A Trouble of Male Sheep.

Diseases of any portions of the urinary organs cannot be said to be common in sheep. It is seldom that any proceed from intrinsic causes, and this is doubtless owing to both the peculiarly sedentary life the animal leads and to its being kept more under natural circumstances than any of the domesticated classes. Of such instances as do come under notice the origin can, either directly or indirectly be traced to small calculi, or accumulations of fine gravelly deposits in some parts of the urinal passages, and with the continued presence of which dangerous symptoms are apt to be associated. It is a fact that until improved methods of feeding sheep became so fashionable, together with forcing for early sales and shows during the summer, affections of this character were, to a great extent, unknown, and at the present time it may be said that in some localities, and with particular flocks, scarcely ever a season passes without deaths, inconvenience, and loss resulting from this cause. Cotswolds, as a breed, appear more predisposed to suffer than others. It has to be remarked that sheep kept wholly and solely on grass are scarcely ever affected.

CAUSES AND MODE OF FORMATION.

Fattening sheep and lambs suffer from the presence of deposit from the urine, but it is much more frequently in the ram that the most acute cases are seen. It originates in the animal being kept on a large quantity of dry food of a highly stimulating character, or a diet which contains an abundance of starchy material, convertible in the system into saccharine matter, such as some of the cakes, barley, wheat condiments, mangel wurzel, and sometimes even turnips. These, together with very limited or no exercise, and scarcely any supply of water, constitute the chief causes. As a result of this system of management the urine of the sheep becomes highly acid, and contains in great excesses those salts which exist in the food it is kept upon. This, conjoined with the sedentary habit of body, and the imperfect performance of natural functions always associated with high breeding, produces a strong tendency to the disposition of sedimentary matter from the urine in some portion of the passages through which it passes. In the ewe, owing to the shortness of the urethra (which leads to the bladder of the external orifice), its largeness of calibre and comparatively freer outlet, the accumulation does not take place, as any calculous material which may exist in the urine is carried off each time the animal stales. In the ram, however, the urethra is much longer, its passage smaller, and at the immediate termination is a fine structure called the vermiform appendage, in which the canal becomes so diminished that even the very least amount of solid particles with difficulty gets through. It is at this point that the accumulation takes place, and continuing, forms a disposition of calculus, which, obstructing both the passing of the urine and exciting inflammation of the membranne of the urethral canal, leads to the most untoward results. Should it remain and increase, the bladder, if not also the kidneys, must as a consequence become likewise inflamed, and owing to this circumstance many shepherds and sheep-breeders, on losing their fattening sheep, rams, or lambs, lay the cause to individual structures, instead of ascertaining its true seat. Chemically, the deposits consist of a small portion of carbonate of lime and magnesia, with a large amount of ammonia-phosphate of magnesia in combination with a little mucus and organic matter. The calculi never, owing to the smallness of the urethral canal, attain any great size, but may gradually form from the vermiform appendage nearly up to the bladder in such numbers as to choke the passage up and constitute a perfect impediment to the passage of the urine.

SYMPTOMS.

The attention of the shepherd is attracted by the sheep exhibiting great difficulty in staling, stretching himself, and straining, yet only a few drops are got rid of, and these with much apparent pain. He is dull, off his feed, and is generally found lying down quite away from his companions. The breathing is quickened, the pulse increased, and he will never get up unless made to or shifted. On being cast on his rump and examined, the part immediately next to the vermiform appendage will be found more or less choked up, the impediment being very easily felt. Often this is only an accumulation of sediment resembling fine sand, the removal of which can be easily affected, and with a little subsequent proper treatment subsidence of the symptoms will result. If the obstruction is not got rid of, the symptoms tend to increase in severity, straining is considerable, and staling becomes next to impossible. There is much constitutional disturbance, the bladder gets enormously distended, and inflammation of its membranne sets in; the kidneys very soon participate; the skin and all excretory organs of the body have a strong smell of urine, owing to its not being got rid of, and the blood becomes highly charged with poisoned material. The head finally is affected, and the animal dies amid much suffering. Owing to such over-distention, rupture of the bladder has also been known to take place.

TREATMENT.

In simple cases, as seen in lambs and wethers that have been fattening but a little while, and the calculous deposits exists merely as accumulations of a fine sand-like character in the tesminal portion of the urethra, throwing the animal on his rump, fomenting with warm water to soothe local inflammation, a little pressure with the finger and thumb, and careful manipulation of the part is sufficient to remove the obstruction. In some instances, with a change of management, the animal has got rid of the matter itself, even after exhibiting severe symptoms. The application of plain sweet oil, glycerine, or vaseline to the parts is beneficial. Saline aperients are best avoided, but a good dose of castor oil, according to the age and size of the patient, can well be employed; a drachm of spirits of nitre is also not a bad adjunct. Following this, from half to a drachm of bicarbonate of potash should be given twice or three times a day dissolved in plenty of water. When much constitutional disturbance exists, spirits of nitre is unadmissible, but extract of belladonna (15 to 20 grains) will exercise soothing effects. The diet should be changed and varied as much as possible, above all; let the flock have free access to water, with plenty of exercise. Branches cut from fir trees are frequently put by shepherds in the way of sheep when cases of this kind occur, and occasionally with a good effect. This it may be presumed, is due to the resinous material contained in the fir

Both A
Bread Flour
And A
Pastry Flour

"A woman always wants a reason, but never gives one".

So we are going to tell you just why **"Beaver" Flour** is a bread flour and a pastry flour —as good for one as for the other—*and best for both.*

Ontario Fall Wheat is the most nutritious wheat in the world — rich in flesh and strength building qualities and with a full rich flavor and splendid pastry making qualities.

Manitoba Spring Wheat has more strength than Ontario Fall Wheat—but is not so good for pastry.

Naturally, *the perfect flour* is the one that combines the good qualities of *both* Ontario and Manitoba wheat. *This is exactly what* **"Beaver" Flour** *does.* It is a *blend* of Ontario Fall Wheat and Western Spring Wheat. It contains *exact quantities of each.* **"Beaver" Flour** has the real home made flavor that a Western Wheat flour lacks—it makes deliciously light, tasty Cakes, Pies and Fancy Pastry.

135

Order "Beaver" Flour

for your next baking day. Put it to the test. Try it for *both* Bread and Pastry—and see for yourself the convenience and economy of using a true blended Flour. Dealers—Write us for prices on Feed, Coarse Grains and Cereals.

THE T. H. TAYLOR CO., LIMITED, - CHATHAM, Ont.

increasing the staling, which washes away the sedimentary deposit, but its action would only tell in the more simple instances. In older animals and rams, when the calculi have attained the size of small seeds, it is impossible to get rid of them through the external opening. In wethers it is usual to draw the parts, cut off the vermiform appendage entirely, and then squeeze the deposit through the opening. With rams—particularly valuable ones—an operation is necessary, and an incision underneath the parts, just sufficient to force the obstruction through, must be had recourse to. This should be done with a sharp knife, and the wound so inflicted, if kept clean, will readily heal up. In these two latter instances, after-treatment of the character alluded to must also be adopted. When acute inflammation of the bladder and kidneys exists as a consequence of urinary deposits, there is not a deal of hope for the patient, and the best thing to do is to call in professional aid, or kill the animal outright to spare its sufferings.

PREVENTIVE TREATMENT.

It must be remembered that a certain peculiarity of system is conducive to the formation of urinary deposits, which accounts for such taking place frequently in certain flocks. Hence, though recoveries have taken place, strong preventive measures must be brought into play, there being every probability of their recurrence. Mangel wurzel is not a good article of food for sheep, especially if taken with highly stimulating dry food, and, if used when turnips are finished, they should be exposed to the sun for a day or so before being given. If rich feeding is employed, a corresponding amount of exercise is essential, as is also free access to water. Barley, wheat, and other foods containing a large quantity of starch should be employed as little as possible. When it is noticed among any of the flock that the removal of the deposit only partially alleviates, it may be taken for granted that other obstructions are also present, either at the neck of or in the interior of the bladder, or in the tubes leading from the kidneys to that organ. The sheep may not yet go amiss for a time, but there is only one course admissible the sooner it is fit for the butcher the better.

Roosting on the Nests.

To prevent hens roosting on the edge of the nests and soiling the nesting material, I took gunny sacks, fastened an old slat to one side and hung them on nails driven in the wall above the nests. I let the slat fall 4 or 5 inches below the edge of the box. The slat weighted the bag sufficiently to keep it in place, and hold it straight. I've never found anything so simple and so good for the purpose. The hens just love to go behind these curtains, as they do not make the nests too dark. In cleaning, I hook the curtains off the nails and carry them out, then move the boxes from the wall and sweep behind them.—Maria Johnson, Penn.

The Effects of Crying.

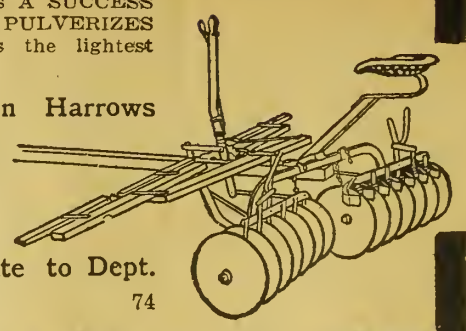
It has long been maintained by eminent authorities that a certain amount of crying is beneficial to a baby; in other words, that is a whole some form of exercise. It is not, of course, suggested that the baby should be tortured into crying in order to give it proper exercise, but the mother should not be disturbed because the infant cries now and then without disturbances of pins or any other discoverable cause. The baby often cries in order to exercise his lungs, and is benefited by so doing.

Prove the "BISSELL" by Its Work

Do the gangs on your Harrow crowd together and raise out of the ground if it is hard? They won't do this on the "Bissell." The "Bissell" is so designed that THE GANGS CAN'T CROWD OR BUMP together no matter how hard the ground may be.

Tough soil won't stick the "Bissell." It stays right down to its work and pulverizes the ground thoroughly.

We ask you to take a "Bissell" out into the field and test it beside other Harrows. Then you will HAVE PROOF that it is A SUCCESS ON HARD LAND—THAT IT PULVERIZES THE BEST—and that it is the lightest draught.



Post yourself fully on Harrows before buying. We put our name on every Harrow so that you will know it is genuine. Ask your local dealer, or write to Dept. "M" for free Catalogue. 74

Miller, 83; Donald Innes, 83½; Fred O. Everett, 79; F. E. Henderson, Sec.

Ventilating Arrangements.

A very simple arrangement by which the air of an apartment can be kept pure, without danger of drafts, is to have fitted into two windows, on opposite sides of the room, a piece of wood two inches thick and the exact width of the window. Raise the window and let it rest on the strip. A current of air will then continually pass in between the sashes.

Another way is to cover a screen of desired size with cheesecloth and insert in windows, the same as mosquito or fly screens. By this method rooms can be ventilated without creating drafts and allowing snow to blow in. This is especially good for bedrooms. Keep them in all winter. In fact, never close all the windows tight, if you value the health of your family.

Use and Care of Files.

The choice of a file for any particular piece of work will be determined by the form of surface to be worked the amount of material to be removed, the nature of the material and the finish to be left on the surface.

From the twenty different standard forms and cross sections in which files are manufactured the user must choose the proper form of file to best fit the work in hand. Next the amount of material to be removed will determine the size and coarseness of the file, the size being the length in inches of the file body without the tang, and the coarseness depending upon the six grades of cuts—rough, coarse, bastard, second-cut, smooth and dead-smooth. The bastard, and second-cut are the grades most used for general work, and the smooth or dead smooth for smooth finish work. All of these forms may be had as either single or double cut, in any grade of cut, excepting that the rough cut is usually single and the dead-smooth double cut. The double-cut file will bite more freely and leave a more broken surface than a single-cut file of the same size.

The nature of the material worked determines in a large measure the "life" of the file. A new file should never be used on very hard material, such as scale of castings and forgings, or on hardened steel; nor should it be used on soft, tough metals, or on thin edges, where it bites to freely. Files should not be thrown into drawers together with other tools. They should be kept clean by brushing, and should never be placed where they will rust, as that will ruin any file.—A. Cammack.

Feeding For Market

TO put flesh on poultry quickly, feed them on the famous Harab Beef Meal. By using 10 to 15 pounds of this concentrated meal with every 100 pounds of your fattening meals or mashes you will increase the food value of your rations from 40 to 50 per cent. You will finish your birds off in quicker time at less expense, and at same time produce stock that will command the highest prices.

Harab Beef Meal is ALL food and absolutely pure. It is one of the famous

Harab Poultry Foods

which are made in Canada, with a big Canadian corporation standing behind them. Hundreds of leading poultrymen now using them. If your dealer will not supply Harab Poultry Foods, write us direct.

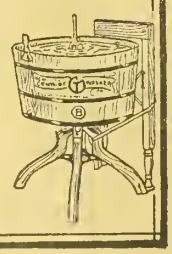
The "New Century" SMILE

Is worn by every housewife who uses one of these washers. The reason is quickly found for the New Century makes washing easy. It removes the hard rubbing and does the work more thoroughly than any other way.

The New Century Hand Washer works quickly and easily. It gushes the water through the fabric, leaving it sweet and clean in a few minutes. It cannot injure the finest garment you possess.

The product of twenty-five years experience in making washers, the New Century is without an equal. Patented features make it the leading hand washer.



Examine it at your dealer's or send to us for information.

CUMMER-DOWSWELL Limited
Hamilton, Ontario.

202

Don't waste your money buying strengthening plasters. Chamberlain's liniment is cheaper and better. Dampen a piece of flannel with it and bind it over the affected parts and it will relieve the pain and soreness. For sale by all dealers.

Honoured by the King.

Mr. George Hughes, the well-known inventor of Molascuit, was specially favored by his Majesty at Bristol. On visiting the Molascuit stand the King asked to have the process explained to him, which Mr. Hughes was able to do in his usual lucid manner. The process is one of using the interior of the crushed sugar cane as the absorbent of the molasses, and is very interesting. The invention is, of course, not only of much importance to English stock fatteners, but has done much for the West Indies, ingeniously uniting two products and preventing one of them from remaining more or less waste. His majesty was most interested throughout the explanation, and as he shook hands with Mr. Hughes at the end of it, as he had done on the inventor being presented, we think it may fairly be premised that he was pleased as well. Those of us who have heard Mr. Hughes on agricultural occasions know what an excellent, clear, and decisive speaker he is, and can imagine how well he would define a process or explain a method of practical science.—London Elementary Standard.

At the Pictou Exhibition

John McDonald, & Son, New Glasgow, and Harold Falconer, Alma, divided the honors for the Ayrshire cattle; John J. McCabe, Alma, and Dan McC. Fraser, Sylvester, in the Holsteins. The Jerseys were variously owned—a nice lot. In Guernseys the chief competitors were D. G. McKay & Son, and Geo. W. McKenzie, Roger Hill. McKay had twelve head and won 7 firsts and 4 seconds, and the herd prizes. Among the lot were a young bull, rising two years, which the Messrs. McKay imported as a calf direct from the Island of Guernsey. See their add in this issue.

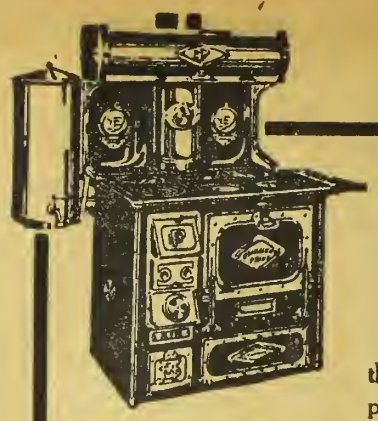
The Food Safe.

The little outside food safe so often used in cottage homes should not be painted but enamelled, which is more weather proof and much more easily kept clean. A cover of sheet-iron is the best, but it must be raised a few inches above the safe top at sufficient angle, allowing enough to overlap at the sides and front to throw off the water and protect the sides of the safe.

The House Fly Cause of Worms in Horses

Dr. B. H. Ransom, in the service of the U. S. Government, has just discovered that the domestic fly transmits not only microbes and germ life on the ends of its feet, in its mouth, and by means of its salivary glands and digestive canal, but spreads certain parasitic worms which infest horses. Dr. Ransom caught at random 137 ordinary house flies, of which a careful record was kept. Thirty-nine were infested with the worm. Even when the flies were killed these parasitic horse larvae remained alive two and more days afterwards. The eggs of this parasite are picked up from manure, dirt, dust, and the flies that touch those things with their salivary fluids pick them up. Then they develop in the insect. The flies hover about the heads of horses and the latter snap them up. Then the larval form—called Habrema musra—which is growing in the fly, begins to enter on its new stage of development in the digestive tube of the horse, where it assumes another form with the new name—Spiroptera microstoma—under which it has been known for fifty odd years as a parasite of the horse. Dr. Ransom is the first to discover that this bane of herdsmen and horse breedess requires the common and unpopular house fly for its birthplace.

WE PAY THE FREIGHT.



At the Factory Price

Buying at the factorywill land this range at your station freight prepaid for $20.00 less than the next best stove on the market. You pocket the dealer's profit—about 30 per cent.—get a beautiful steel and malleable iron range built to last a lifetime. And what's more you save money every month on your fuel bill.

Every Range is unconditionally guaranteed.

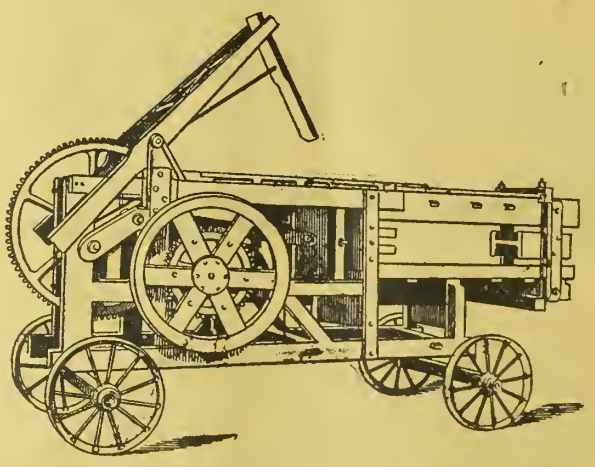
Hay Presses & Woodcutters

Our Hay Press is operated by either Steam, Gasoline Engine or Tread Power. The whole machine is so powerfully constructed that no jar is felt in any part when in operation. The Bale Box is steel lined. The Side Springs, which are thoroughlv tested, are made of the best quality of Spring Steel, The Folder is located to do perfect work, and requires but a slight spring pressure to operate.



We manufacture our Woodcutters in four different sizes and styles: two styles Long Swing, Short Swing and Flat Roller Table.

All our machines are guaranteed for a year against any defects in workmanship and material.

David Copperfield.

(Continued from page 93)

needn't wince!" said my aunt. "I know it's true without that."

He had stood by the door, all this while, observant of her, with a smile upon his face, although his black brows were heavily contracted. I remarked now, that, though the smile was on his face still, his colour had gone in a moment, and he seemed to breathe as if he had been running.

"Good day, sir," said my aunt, "and good bye! Good day to you, too, ma'am," said my aunt, turning suddenly upon his sister. "Let me see you ride a donkey over my green again, and as sure as you have a head upon your shoulders, I'll knock your bonnet off, and tread upon it!"

It would require a painter, and no common painter too, to depict my aunt's face as she delivered herself of this very unexpected sentiment, and Miss Murdstone's face as she heard it. But the manner of the speech, no less than the matter, was so fiery, that Miss Murdstone, without a word in answer, directly put her arm through her brother's, and walked hautily out of the cottage; my aunt remaining in the window looking after them; prepared, I have no doubt, in case of the donkey's reappearance, to carry her threat into instant execution.

No attempt at defiance being made, however, her face gradually relaxed, and became so pleasant, that I was emboldened to kiss and thank her; which I did with great heartiness, and with both my arms clasped round her neck. I then shook hands with Mr. Dick, who shook hands with me a great many times, and hailed this happy close of the proceedings with repeated bursts of laughter.

"You'll consider yourself guardian, jointly with me, of this child, Mr. Dick," said my aunt.

"I shall be delighted," said Mr. Dick, "to be the guardian of David's son."

"Very good," returned my aunt, "that's settled. I have been thinking, do you know, Mr. Dick, that I might call him Trotwood.

"Certainly, certainly. Call him Trotwood, certainly," said Mr. Dick, a little abashed.

My aunt took so kindly to the notion, that some ready-made clothes, which were purchased for me that afternoon, were marked "Trotwood Copperfield," in her own handwriting, and an indelible marking ink before I put them on; and it was settled that all the other clothes which were ordered to be made for me (a complete outfit was bespoke that afternoon) should be marked in the same way.

Ths I began a new life, in a new name, and with everything new about me. Now that the state of doubt was over, I felt, for many days, like one in a dream. I never thought that I had a curious couple of guardians, my aunt and Mr. Dick. I never thought of anything about myself, distinctly. The two things clearest in my mind were, that a remoteness had come upon the old Blunderstone life—which seemed to lie in the haze of an immeasurable distance—and that a curtain had forever fallen on my life at Murdstone and Grinby's. No one has ever raised that curtain since. I have lifted it for a moment, even in this narrative, with a reluctant hand, and dropped it gladly. The remembrance of that life is fraught with so much pain to me, with so much mental suffering and want of hope, that I have never had the courage even to examine how long I was doomed to lead it. Whether it lasted for a year, or more, or less, I do not know. I only know that it was, and ceased to be; and that I have written, and there I leave it.

ROOFING

Let these Great Artists Select Your Piano

THE most significant chapter in the history of Canadian pianoforte construction records the brilliant achievements of this piano. ¶ Regarded from its inception as one of the world's great pianos, the pre-eminence of the

Vertical Scale Williams Piano

has been confirmed by the almost unanimous endorsement of the renowned vocalists, violinists and pianists who have visited Canada. ¶ The following quotations are from a fascinating collection of autographed letters which will be sent you on request for book 3B:

"Equal to any instrument I have seen."

"Remarkable qualities quite out of the ordinary."

"A concert instrument of the highest class."

"Rich, even tone and sympathetic quality of great value."

"The exquisite liquid tone was an inspiration."

"The sweet, round, mellow tone make it a perfect instrument"

"I congratulate you on giving Canada a piano of such great merit."

"The piano possesses brilliancy and purity of tone quality."

Special Advice For Men

Vitality Restored by New Method

The attached coupon entitles you to one illustrated copy of my pocket compendium and guide for the self-restoration of lost strength. (See description below) Upon hearing from you, this valuable little book of private information for men will be sent by return mail in plain sealed envelope. Please call or write today.

There is a new and marvelous metbod for restoring lost manly strength, for renewing the vigor of youth, which every man should know of, a self-restorer which operates without the use of drugs or medicines, a new way to treat yourself and by which it is my firm belief any man anywhere who is content to lead a decent life, free from excesses and dissipations may be almost certain to restore his full manly vigor snd strength, if he but makes the little effort that is called for in connection with the use of a little vitalizing appliance which I have patented and am now distributing all over the world.

Please remember that a man is not one day older than be actually feels, and therefore uo matter what your age, if you are young or elderly, married or single, large or small, if I can show you reader, how you can yourself actually add to your system, nerves and blood the very nerve force or vital vigor which nay have been drained away, and wbich is necessary to make you strong, vigorous, and capable again, then I have shown you the real secret of perpetual youth, and how you can again be filled with vitality and again be just as powerful in your influence and just as thoroughly manly in your capacity as the bigges t fullest blooded, most successul fellow of your acquaintance.

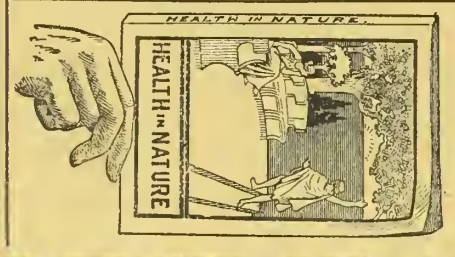
HEALTH IS HAPPINESS

I call my vitalizer a HEALTH BELT because it is worn around your body in the position of an ordinary belt. It sends a great, soft, strength-giving supply of a force I call vitality into your body nights while you sleep. I would like you to call or to write and get my free book, that you may know the whole wonderful account of what my HEALTH BELT is doing for others who were looking for a safe and sure means to restore vigorous health and to rid the body of pains, aches and weaknesses.

Note—My HEALTH BELT, with special attacbment, is used by women as well as men or rheumatism, kidney, liver, stomach, bladder disorders, etc.

86-PAGE BOOK SENT FREE

My 86- page illustrated booklet (pocket size) was compiled by me to answer fully and correctly those questions which are asked privately by any man needing new strength and who seeks personal advice pertaining to the ailments and weaknesses he wishes to overcome. The book, fully illustrated, with pboto reproductions contains much that a single or married man should know. It also fully describes my HEALTH BELT and tells how you may secure one to use in your own case, should you decide you want to use one. Remember the book is sent absolutely free, in plain, sealed envelope. Why not write for a copy today?



DR. M. F. SANDEN,
140 Yonge St., Toronto, Ont.

Hereditary Traits in Milch Stock as Revealed by Danish Control Unions

IN THE work of selecting the best possible milch stock, the Danes have for a number of years given particular attention to heredity. They made it a special study from the start to produce a pure breed of first grade milkers. At that time they had no herd books to help them, they had only their own judgment to rely upon. The racial characteristics and good qualities of the animals were the chief points which helped them to estimate whether or not the breed was free from foreign blood. Little by little the herd book grew in size and they got to know a little about the sire and dam and as time went on grandsires and grandams, etc. In this way a more accurate account was kept of the breeders than by merely estimating them from the known qualities of the existing animal. According as the herd book grew, it became more and more helpful with regard to the selection of sires or dams as it was easy to see if they belonged to a prize strain, etc.

But the herd book only gave information about the build of the stock and the purity of the strain and stopped there. The most desirable information was lacking, i. e., the amount of milk yielded and the percentage of fat it contained. The breed and build of the stock were good in their way, but the end immediately in view was to increase the percentage of fat in the milk and the herd book contained no information on this point. Many hard-headed farmers could not understand how the herd book helped them towards this goal. In bargaining about a bull they said: "It is very good to bear so much as to the animal's pedigre), but if you can tell us something about the milk of the sire's dam and grandam and the dam's dam and grandam, why that's just what we want to know about. May we expect that the bull in question will raise the fat percentage in the milk of our stock?" At that time there was no reliable information on these points and the buyer was obliged to take his chances.

In 1893-95 the control unions came into existence and gave state controlled information regarding the quantity of milk, the percentage of fat and the number of pounds of butter made from it yearly. The material placed in the hands of the Danish dairyman in the course of some years enabled him to select the best animals for breeding purposes with considerable accuracy. There is no surer road to the improvement of the quality and quanity of the milk than by availing yourself of the state controlled individual record of each animal.

Before the advent of the control unions many strains had won excellent reputations and farmers bought freely of such strains. In some cases their stock was much improved, in others slightly improved, and in others there was no visible improvement. Some farmers, who attached too much importance to breed, build and pedigree and too little importance to the quality and fat percentage of milk, felt disappointed in the results of their labors for the improvement of their milch stock. The less fortunate results might in many cases be attributed to the fact that good and bad animals exist in every prize strain and the buyer is just as likely to get a bad bargain as a good one. The control unions hindered the sale of bad bargains to a great extent as they furnished reliable records concerning the merits of the individual milkers. For this reason the farmer is not quite so likely nowadays as in the past to pay out a large amount of cash for an indifferent animal with a pedigree.

It may be of some interest to show how cattle selected with ordinary care may fail from one cause or another to improve the milch stock, but it is much more interesting to demonstrate the importance of a selection made in conformity with state controlled information, that is to say, information which sets clearly forth how far the offspring inherits the good or bad qualities of the sire and dam As it requires a great many years to estimate the effect of heredity, the amount of information available so far is meager enough.

The figures quoted regarding the quantity of milk must be taken with considerable reserve as they vary in a great measure according to the feeding and care of the animals. The quantity of fodder and care of the animals on a farm where a bull is bought may be very different to that of the farm where his offspring is foundso that a direct comparasion of the sire and offspring is unjustifiable.

All comparisons quoted in this article will be between the yield of the dams and their offspring. If the offspring yield more than the dams there is good reason for assuming that the increase is caused by the bull and if they yield less than the dams it may also be attributed to the same cause.

The percentage of fat in the milk is of first importance in deciding the question of milk yield as, unlike the quantity of milk it is not influenced by the quantity and quality of the fodder. The fat percentage must therefore decide the matter. The report of an inquiry concerning the productivity of the offspring of two prize bulls, Brondstrup I and Brondstrup III throws some light on the question of heredity and the fat percentage.

It was ascertained that these bulls, which in their way were considered to belong to the best strain of Red Danish milch cattle on the Island of Fumen, begot offspring whose milk was neither rich nor plentiful. The average amount of milk produced annually by 18 controlled cows (offspring of the bulls referred to) was for each, 6,636.5 pounds of milk containing 3.19 per cent. fat.

Although there was ground for assuming that the low fat percentage was due to the influence of the bulls, this cannot be quite certain as the dams of the milkers were not controlled. Another bull in Copenhagen county "Ole Romer," a son of Brondstrup I and a cow, which was a half-sister to Brondstrup I, have produceda number of offspring of which six head were controlled. Their average yearly production was 8.518 pounds of milk containing 3.07 per cent. fat.

Another bull bred from the same cow and sired by Brondstrup III has in like manner given much milk with a low percentage of fat; a third bull, which was bred from a whole sister to Bronstrup III begot a number of offspring of which five head were controlled and their milk contained 3.07 per cent. fat, while that of their dams which were also controlled averaged 3.49. This goes to show that the bulls of that strain begot offspring whose milk contained a low percentage of fat.

These figures are not encouraging, but they give a broad hint that there is good reasons to guard against poor milk and that the offspring always inherits more or less determined proportions the good qualities of the defects of the sire and dam.

It is more interesting to see how far the percentage of fat can be raised by systematical choice. In the bull union of one county where systematical choice had been the rule for many years, the members succeeded in improving their milch stock through the use of good bulls. In the year 1900, the aim of the union was to raise the percentage of fat in the milk and the members agreed to select and buy a bull for this purpose. They bought a bull whose sire had begotten offspring with rich milk and whose dam and grandam had given milk containing 3.90 per cent. fat. This bull, Max Dysted I, was kept by the union for a number of years and begot many offspring, the majority of which were controlled and almost all gave rich milk. In this case the cows, from which the offspring were bred, were controlled; so they can be compared with the offspring. In order to make the comparison as fair as possible only the offspring, which were controlled after calving for the third time are included.

The records of the dams also apply to the period after their third calf. The average annual production for each of nine dams was: 9043 lbs. of milk containing 3.09 per cent. fat and yielding 508 lbs. butter. The average annual production for each of nine offspring was: 8,087 lbs. of milk containing 3.77 per cent. fat and yielding 339 lbs. of butter. The increase in the percentage of fat and in the amount of butter is rather remarkable. It may be pointed out as a drawback, that the quantity of milk is about 960 lbs. less for the offspring han for the dams at the same age. This was an heredity trait, as the richness of the milk and its diminished quantity were characteristics of the dam and grandam of the bull. At that time it was difficult to find bulls with satisfactory records as to breed, build, fat percentage, etc.

The bull union wanted rich milk and were obliged to renounce the quantity for the sake of the quality and the result answered their purpose.

In the financial years, 1911-12, each of 23 heifers sired by Max Dysted I gave on the average: 7,634 lbs. of milk containing 3.92 per cent. fat and yielding 333 lbs. butter. The experiences of a private dairyman in Copenhagen county yields further information of an interesting character. This man had a stock of good, well-built milkers in 1897-99 of the red Danish breed whose milk was rather poor in fat. The average annual yield of each of sixty cows was: 8,818 lbs. of milk containing from 3.25 to 3.40 per cent. fat.

In 1900 the owner resolved to raise the fat percentage of his milch stock by securing a suitable bull. With this object in view he bought the bull Dan. There was not a great deal of information to be had about Dan. His dam was controlled and the average fat percentage of her milk was 4.16 per cent. fat; its quantity variedgreatly as she suffered for several years from udder disease, became three-teated and finally two-teated. Besides this, it was ascertained that the offspring of Dan's sire, Taurus II, gave rich milk. At present, there is an account of sixty heifers sired by Dan, each of which has a higher percentage of fat in its milk than its

dam. In the following table all the offspring (heifers) are included for which there were corresponding control records of the dams at the same age.

	Number of Cows	Financial year	Milk lbs.	Fat %	Butter lbs.
Offspring	33	2nd	9,666	3 99	371
	20	3rd	8,735	3.84	417
	14	4th	10,034	3.86	433
Dams	33	2nd	8,5468	3.38	320
	20	3rd	9,510	83.4	352
	14	4th	9,03	3.48	341

As a supplementary to the foregoing it may be stated that the average yield of 33 offspring for the financial year 1911-12 was for each 10,744 lbs. of milk containing 3.97 qer cent. fat and yielding 472 lbs. butter.

This information it rather interesting as the controlled account of dams and offspring comes from the same source, affects the same stock at the same age and subject to the same care and attention so that the remarkable increase in the fat percentage may be correctly ascribed to the influence of the bull. The increase in the percentage of fat is more than one-half pet cent. and in the amount of butter about 63.13 lbs. per cow annually. The amount of butter for the 33 offspring mentioned last would be 406.74 lbs., if the fat percentage were 3.40 per cent., whereas the actual yield is 772.88 lbs. of butter and amounts to 66.13 lbs. of butter more for each cow or for the 33 cows, 2,182 the fat percentage 3.97 per cent. This is a goal worthy a long, tenacious struggle on the part of any cow keeper.

The next step taken by the same dairyman was to endeavor to attain an average of fat percentage of 4 per cent. for his entire stock. He made an energetic search through control books, etc., and at length found the bull Hermod, whose dam was recorded as giving a yearly average for two years of 7,966 pounds of milk containing 4.82 per cent. fat. This fat percentage was almost unheard of It was so high that most hard-headed dairymen shook their heads and were skeptical about the figures. Hermod was used for some years and as soon as there was an account of the offspring most dairymen were anxious to know the result. The first record was that of the first financial year of control and the following figures indicate the return of five offspring together with that of the dams all controlled at the same age. Average of each of five offspring: 6,942 pounds of milk containing 4.41 per cent fat and yielding 344 pounds butter. Average of each of five dams controlled at the same age: 8,326 pounds of milk containing 4.14 per cent. fat and yielding 391 pounds butter.

The great augmentation in the fat percentage of Hermod's offspring is sufficient to prove the influence of the bull. The milk yield of the offspring, which is considerably less than that of the dams, seems to counterbalance the increase of the fat percentage. This is not the case, neither is the decline in the milk so great as it appears. The circumstance is due to the calving time. The average calving time for the offspring was April and that of the dams November. It is a well known fact that the average milk yield of cows which calve in spring is considerable lower than that of cows which calve in autumn. The figures which indicate the quantity of milk cannot be compared in this case.

In the financial year 1911-12 the average return for each of 15 offspring sired by Hermod was: 9,100 lbs. of milk containing 4.25 per cent. fat and yielding 463 pounds butter. In spite of the fact that this is a particularly good yield and an over-realization of the fat increase aimed at in making the selection, it must still be admitted, that the quantity of milk does not compare favorable with that of the offspring sired by the bull Dan. Hermod seems to have inherited in more or less determined proportion the shortcoming of his dam who did not give a large quantity of milk.

The figures in the foregoing article prove what may be attained through purposeful, systematic choice in the matter of stock breeding. If it is possible in this way to raise the fat percentage in the milk, there isn't the slightest doubt but that the build of the stock may be improved along the same lines.

But it will never be brought about by folding one's arms and leaving everything to chance. In trusting to choice, the animals are only apt to be good. It lies in the hands of the breeder to develop this aptitude to the fullest extent and afterwards in the hands of the dairyman to thoroughly develop and observe the latent facilities of the animals by careful feeding and control.—J. J. Dunne, Denmark, in Hoard's Dairyman.

A School Teacher's Enterprise.

One of the most interesting letters recently received by the Dairy Commissioner, Ottawa, is from a school teacher in Alberta who asks for milk record forms and literature on the subject of cow testing, because—now listen: Some of the boys in the school ars starting a contest in recording the production of individual cows to last one year.

This opens up a most promising field for every school teacher and for thousands of boys in our country schools. In this we would be following somewhat slowly in the wake of many schools in the United States and New Zealand where the use of the Babcock milk tester has been taught for some time. In a dairy country like this, we should be out blazing trails for other teachers and boys to follow.

No better work could be taken up by such lads for any record work of that kind must infallibly lead to better, vastly better, conditions on dairy farms. Probably these Alberta lads will soon be excellent dairymen obtaining seventy-five or one hundred dollars per cow.

Needless to say the Dairy Division will be only too ready to supply blank forms and instructions in all such cases.—C. F. W.

Bran, Shorts and Chop Feed.

In the months of September and October, 1912 the Inland Revenue Department purchased throughout Canada 396 samples of feeds sold as bran, shorts or middlings and chops. The samples may be taken fairly to represent the character of cattle feed offered under the above names. Such feeds are required to possess the following values:—

	Proteids.	Fat	Fibre
	Min.	Min.	Max.
Bran	14	3	10
Shorts & middlings	15	4	8
Chop	10	2	10

Although feeds of these classes are not required to be registered before being offered for sale, it is not forbidden that any manufacturer who believes his product to be notably better than the minimum legal requirements should register this and sell with a guarantee of quality. In such case the manufacturer must give some distinguishing name to the article, and not sell it simply as "Bran." He may name it "Smith's Bran," or "Jones' Bran," or he may devise a specific name for it. For purposes of the Act, the Article then becomes "Stock Feed" as defined by Sect. 2 (b) of the Act; and is amendable to the conditions of Sect. 2 (e) and Sect. 15. Thirty-eight samples of bran, shorts and chops among the 396 now reported are sold with a guarantee of value. It is, of course, proper that the manufacturer should be required to live up to any guaranteed value which he claims; and it may thus happen that a bran (for example) which would have passed as legal bran, if sold without any special claim of quality may be found deficient and technically adulterated because it fails to show the content of proteid matter or fat which the manufacturer claimed, and upon which, rather upon legal requirements for bran, it is judged.

The following table gives a concise statement of the results of analysis of bran, shorts and chop feeds.

	Sold with a guarantee		Sold without a guarantee		Total		
	Meets guarantee	Below guarantee	Genuine	Below requirement	Genuine	Adult	Sum.
Bran	8	4	121	2	129	6	135
Shorts or middlings	1	3	127	8	128	11	139
Chop	16	6	91	9	107	15	122
Total	25	13	339	19	364	32	396

In some cases the deficiency is very small and may be regarded as accidental. Sometimes the deficiency is one component is fully compensated by overplus in another, so that the purchaser of the feed is not defrauded except technically. As a rule the deficiency is most notable in cases where a guarantee of value is given, the manufacturer evidently basing his guarantee upon a higher analytical result than he has found it practicable to live up to. It is to be noted that standards, as interpreted by section 15 of the Feeding Stuffs Act, 1909, provide for deficiency of one per cent in proteids or fat or for an excess of two per cent fibre, if the total value of the feed is not impaired thereby.

So far as nutriment value is concerned, it therefore appears that only 23 sample out of 396, or less than six per cent of the collection, can be regarded as adulterated under the Act. Of this number, one sample is doubtfully amenable to the charge of adulteration; and seven others, while failing to meet the manufacturer's claims are found to meet the legal minimum values for the class of feed to which they belong. This leaves only fifteen (15) samples in whose regard no extenuating circumstances can be pleaded.

Even among these it will be found that the deficiencies are for the most part slight, and the report shows that bran, shorts and chop feeds are so far as their feeding value goes generally of good quality. Modern milling processes are so complex, and the natural desire of the manufacturer to work economically and to secure a maximum value from his grain is so great that with the fullest intention to bring his low priced products up to the legally required minima, it is inevitable that he should at times utter a sample below standard, unless he takes the precaution of checking his output by analysis.

In Bulletin No. 231 The Department calls attention to a variety of feeding stuff sold as shorts or middlings, but having characters which would seem to indicate that it is rather low-grade flour than shorts or middlings, as these are generally known. The following quotation from Bulletin No. 231 explains this matter:—

"A considerable of samples, which appear to answer a description of low grade flour, were found in the above collection; but these were supplied indiscriminently as shorts or middlings, as indicated by the maxima for fibre and for fat, though most of them were sold as middlings.

"In order to discover whether the present collection indicates any accepted distinction between the terms, I have collated the results for 72 out of 37 samples sold as shorts, and for 54 out of 68 samples sold as middlings, being in each case the number of samples respectively, which meet the requirements of legal definition.

Seventy-two (72) samples of shorts give results as follows:—

SHORTS.

	Fat.	Proteids.	Fibre.
Means	4.65	16.20	6.3
Maxima	6.48	18.46	8.0
Minima	3.44	14.00	3.9

"Fifty-four (54) samples of middlings give the following results —

	Fat.	Proteids.	Fibre.
Means	4.47	15.59	5.2
Maxima	6.26	18.02	8.1
Minima	3.02	14.13	1.4

"The results appear to justify the conclusion that the article sold as shorts is not substantially different from the article sold as middlings; and this conclusion is corborated by the expressed opinion of many millers, in answer to questions by our inspectors. At the same time it is to be noted that samples characterized by very low fibre, low fat and high starch content (indicating flour), are usually sold as middlings, rather than shorts.

"Feeds of this kind should be sold as feed-flour; or by some name which distinguished them from legal shorts or middlings. While they possess considerable value for feeding purposes, they must be regarded as adulterated under the Act when offered as shorts or middlings. Their low fibre content is an advantage from the point of view of nutritive value, since this is replaced by starch in amount equipalent to the difference between the legal maxima the legal maximum for fibre (8 per cent) and the actual fibre present."

The Department is convinced that in none of the above listed samples is there any evidence of intended fraud. The irregulgrity is apparently due to ignorance of legal requirements for shorts (middlings), and a mistaken idea that a low grade flour is even better value, than middlings as usually understood. The Department feels justified in recommending that for this first inspection under the Feeding Stuffs Act leniency be exercise towards the vendors, and their attention called, to the requirements of the Act."

It is a matter for consideration whether the Act should not be amended by addition of this description of feed under the name "FEED FLOUR" in such case it would be necessary to amend the Act in Section 2 (b), by exclusion of the term "FEED FLOUR" as a commercial feeding stuff requiring registration.

The standard for bran, shorts and chop feeds, as defined in the old Act, were amended on June 7, 1911, by the following clause: 'And must be free

from vital seeds of any of the noxious Weeds defined by the Governor in Council under the Seed Control Act.'

Examination of all the samples herein reported as to their content in vital weed seeds has been made by the courtesy of the Department of Agriculture, through the office of the Serd Commissioner, Geo. H. Clarke, who reported as follows:

We have not made germination test of any of the weed seeds enumerated to determine whether they are vital. We have, however, enumerated only those weed seeds which were found to be fully matured and in perfect condition; these we have assumed to be vital.

Nature has provided most kinds of noxious seeds with a hard or mucilagenous seed coat by which the germ may be protected, even though the seed may be exposed to the best possible conditions for germination; such weed seeds do not lend themselves readily to artificial methods for determining their percentage vitality.

From research work that has been done in our seed laboratory and elsewhere, however, we have good reason to believe that there are exceedingly few fully matured and uninjured seeds of plants that can properly be characterized as noxious weeds that are not capable of germinating. The fact that they cannot be forced to germinate until nature has prepared them for such is the principal factor that brings them within the category of noxious weeds and makes them so troublesome to farmers.

The result of this examination is presented in the following summary:—

	Samples.
Containing more than 400 vital weed seeds per lb.	6
Containing more than 300 vital weed seeds per lb.	3
Containing more than 200 vital weed seeds per lb.	4
Containing more than 100 vital weed seeds per lb.	11
Containing more than 50 vital weed seeds per lb.	14
Containing more than 25 vital weed seeds per lb.	27
Containing less than 25 vital weed seeds per lb.	71
Free from vital weed seeds.	260
Total	396

The Seed Control Act (1-2 George 5, Chap. 23) of 1911, as interpreted under Order in Council under section 2, is as follows:—

The maximum proportion of noxious weeds that may be tolerated in any other seeds without affecting their character as being free from the seeds of the said weeds within the meaning of section 6 of this Act, shall be as follows:—

(a) For seed of oats, barley, wheat or other seeds similiar in size, one weed seed in one pound avoirdupois.

(b) For seed of flax, millet or other seeds similiar in size, one weed seed in one ounce avoirdupois.

(c) For seed of white clover grasses, five weed seeds in one ounce avoirdupois.

It is to be kept in mind that these regulations apply to seeds intended to be applied directly to the land. In the case of cattle feeds, the vital weed seeds are presumably applied to the soil only after they have passed through the alimentary tract of the animals to which they are fed, and it is reasonable to suppose that their vitality will be greatly affected in the processes of digestion.

The only experimental data available directed to the determination of the vitality of seeds which have been fed to animals is contained in a report published as Bulletin No. 128 of the Maryland Agricultural Experiment Station, College Park, Md., in June, 1908.

This valuable study of the question is briefly presented in the following summary:—

SUMMARY.

The above results were obtained through experiments concerning the vitality of weed seeds under the influence of their distribution by manure along two different lines; namely, the effect of fermenting manure on the vitality of weed seeds (seeds introduced through bedding) and the effect upon the vitality of weed seeds after passing through the digestive channel of domestic animals (seeds fed to animals).

The first part of the experiment was accomplished so as to cover the condition where manure remains for six months in a barnyard, pound or pile. The second covered conditions where the manure remained on piles for a short while, as when shipped by carload lots from cities.

From the above results the following conclusions seem to be justified:—

1st. When manure is allowed to ferment in piles for six months no danger of distributing weed seeds is incurred.

2nd. When manure is allowed to remain in piles and undergoing partial fermentation, little danger of distribution is incurred.

The second part of the experiment which dealt with the effect upon the vitality of weed seeds after passing through the digestive channels of domestic animals was accomplished so as to bring about three existing conditions.

1st. Manure hauled direct from the stable to the field as a top dressing and left there exposed to the washing of the rains.

2nd. Where the manure is hauled directly from the stable to the field where it is immediately ploughed under.

3rd. Where the domestic animals are allowed to run in pasture and the droppings are allowed to remain wherever they chance to fall.

From the above tables in the latter part, the following results were obtained:—

1st. Where the manure was hauled directly from the stable as a top dressing an average of only 12.8 per cent of the feds fed to animals germinated.

2nd. Where the manure was hauled directly from the stable upon the land and ploughed under, 2.3 per cent of the seeds fed to animals came up.

3rd. Where the droppings remained on the pasture fields unadultered as they fell, an average of only 3.1 per cent of the seeds fed to animals germinated.

Geo. H. Clarke, Seed Commissioner expresses the following opinion:—

"There has been quite a large number of samples of mill feeds analysed in our seed laboratory covering the period of six years, and from the results of this work we have formed the opinion that the proportion of whole weed seeds contained in the feeding stuff depends largely on the care or lack of care on the part of the manufacturer.

Weed seeds in seed grain are probably five times more dangerous to agriculture than are weed seeds in mill feeds, for the reason that only a small per cent of the weed seeds fed to stock ultimately are put on the land in viable condition.

"For the present, I think I cannot do more than to express the opinion that if you were to tolerate five noxious weed seeds per pound of bran, shorts or chop feed before you consider their character affected as being free from the seeds of the said weeds within the meaning of your regulations, then field agriculture would be as well safeguarded as it now is under the regulations that are applied for a similiar purpose under the Seed Control Act."

This last suggestion would place the limit at five vital seeds of noxious weeds per pound; and it is proper, in its regard, to further analyse the case of 71 samples of this collection which contained less than 25 weed seeds per pound:—

	Samples
20 or more weed seeds per lb.	8
15 or more weed seeds per lb.	11
10 or more weed seeds per lb.	14
5 or more weed seeds per lb	18
Less than 5 weed seeds per lb.	20
Total	71

It may be found necessary to place the limit for vital weed seeds in bran, shorts and chop feeds as low as suggested by the Seed Commissioner. There can be no doubt, however, that when the number exceeds 25 seeds per pound, a reasonable limit is passed, and such samples must be regarded as adulterated, on this ground and altogether apart from considerations of nutritive value.

Many of these contain notable amounts of protein and fat, and if properly ground so as to destroy their vitality they might not be objectionable in a feed except in such species as contain acrid or poisonous principals.

Complaints have frequently reached this office to the effect that animals refused to eat certain feeds, or that ill effects have been noted after feeding.

A perusal of the tables submitted by the department reveals the fact that 62, perhaps 63, out of the 65 samples recorded as containing more than 25 vital weed seeds per pound are of satisfactory value as regards the nutritive values of the feeds. This does not prevent them from being judged as adulterated, provided that the limit number of 25 vital weed seeds per pound be held adjustiable, which limit is quite liberal.

Thirty-seven samples are sold as chop, 18 samples as bran and 10 samples as shorts or middlings. It is to be expected that if unground 'weed seeds are to be found in cattle feeds they should appear in chop or in bran. They should not apparently be found in shorts or middlings because this product is supposed to represent only the result of such fine grinding as should ensure the destruction of the seeds by comminution. It would seem that whole weed seeds could only appear in shorts or middlings by purposeful addition of waste 'screenings.'

It is evident from this study that purchasers of stock feeds have little ground for complaint as regards the feeding value of these goods.

On the other hand, they contain very notable amounts of vital weed seeds, and, in the light of present knowledge are adulterated when such contamination exceeds 25 seeds per pound.

The practice of adding 'screenings' or 'offal' to bran, shorts and chop is very objectionable, and unless the 'screenings' have been ground so fine as to destroy the vitality of the weed seeds contained must be held to be a violation not only of the Adulteration Act, but, in spirit at least, a violation of the Seed Control Act.

Financial Report of the Halifax Exhibition.

This year as in years past, various Nova Scotia newspapers are out with the headlines "Deficit on this year's Exposition was over $10,000," while papers in the other provinces report their fairs as either "breaking even" or coming out with a "surplus." The headline "Deficit" as applied to the Nova Scotia Provincial Exhibition is hardly justifiable. Fairs in the other provinces receive an annual grant and as above stated either "break even" or leave a "small surplus" while the Halifax Exhibition does not receive a grant, the Province of Nova Scotia and city of Halifax meeting the apparent deficit share and share alike. Supposing that the Halifax exhibition had been granted a round sum of $10,000, which amount would be the very lowest that any government would offer for an exhibition of the magnitude of the Halifax fair it too could be reported as "breaking even" or coming out with a "small surplus."

When contrasting the following report with that of the other provincial fairs we trust our readers will look on it in the right light and will not be carried away with any wrong conceptions of the success of the fair.

Following is the financial statement of the fair:—

The Provincial Exhibition Commission met on the 18 inst. and fixed Sept. 9th to 17th as the dates for next year's fair. The deficit on this year's show is $10,139.26, which is the lowest for years. In 1910 the deficit was $14,000, and last year it was over $800 more than the present year.

A change is contemplated at the grounds, especially affecting a rearrangement to the live stock buildings.

On application of the Trades and Labor Council the grounds will be put to their use on Labor Day and the firemen will be gipen the use of them on a day in August during the tournament.

The report presented by Manager Hall was as follows:

I beg to submit my report of the Seventeenth Annual Exhibition held September 3rd to the 11th, and as the Superintendents will report for their various department I shall confine my report to the Exhibition as a whole.

Notwithstanding various letters that have appeared in the press, some of them going so far as to say the Exhibition of 1913 was the "worst ever," I feel that this statement will stand investigation.

Beginning with the live stock class, our exhibit in the horses class was the best since 1906, there being 20 per cent. more exhibits than last year.

The Beef Classes were larger, the Dairy not quite so large. The falling off being in the Aryshire and Holsteins, while a perceptible gain was made in the Grade Dairy.

In both the Sheep and Swine classes exhibits were the largest and best we have had for some years.

In the Live Stock Classes it is gratifying to note that the twenty-three exhibitors appeared for the first time.

The Poultry exhibit was not so large as last year, due entirely to the early dates at which it is impossible to get a large exhibit.

It is not to be expected that a good showing of fruit can be made in the early part of September, particularly when the season is a backward one as was very plainly evidenced by our show in this class this year.

The suggestions made by a Fruit Growers' Association, that a Fruit Show be held in this City during the month of November, combining our Fruit Department with the Valley Fruit Show, is one that should be considered and steps taken to carry same out.

Although a late season the exhibit in the Root and Vegetable Department was an exceedingly good one, and as stated by the Judge the best we have had here in years.

The Domestic Department, while not containing as many exhibits as last year, was, I think, one of the most attractive tney have ever had, while the Arts, as usual, though confined very largely to local exhibitors, was well worth the price of the gate admission.

The Mines Building received much

FARMERS SHOULD MAKE PRICES.

We have suggested that if an increase of the food supply is ever needed, it will be up to the rest of society to make the financial returns to the farmer sufficiently attractive to cause an increase in the number of farmers and an increase in the product. It is probable, however, that the farmers will have to force the issue and compel the rest of society to pay to them a sufficient price so that the returns to the farmers for the things they produce upon the farms will be adequate in comparison with the terms that come to others for the handling of those supplies and for other kinds of labor of hands or minds, not one of which is so essential or fundamental as the labor of the farm. It is hardly to be expected that the rest of society will pay the farmers more for their produce unless they demand more and can show reasons for the demand in a statement of the cost. It is right here that a revolution in business is needed. In his relation to the food supply, the farmer is a manufacturer as much as any other business man. He is more than that, he is the original producer. But in his business relations he is a manufacturer. As a manufacturer, however, he is an anomoly, for he is the only manufacturer who allows some other business interest to set the selling price upon his goods. The manufacturers who change the form of the products of the farm not only set the price of their own manufacturers, and set it high enough to make large profits, but they make the price to be paid to the farmer for his original product. This is a practice and custom of modern business which is radically wrong in theory and principle. The farmers ought to set the prices on their products, and they must do so before the business of farming is put upon the right basis.

We can imagine the assurance and compliance with which many of the commercial interests would receive this suggestion, and the tolerant patience and magnanimity with which it would be explained to one who had little understanding or conception of the principles or exigencies of business, that the general principle that the farmers, being the producers, should set the prices on their products, but that in actual practice it would be impossible and impracticable on account of the diverse interests and the peculiar conditions under which farm products are sold and distributed.

It probably would be impracticable from the point of view of those diverse interests and undoubtedly it would be impossible for the farmer to set the prices while he lacks knowledge regarding the cost of farm products.

It is inconceivable, however, that it should not be possible and practitable for the farmer, the man who produces the food supply of the world, and the original producer of all the other necessities of life, to determine and know what it costs him to produce those things, and then set the prices which he should receive for them.

The first great essential, therefore, in bringing about the proper condition is that the farmer should learn the cost of his products. It is not to be expected that every farmer would be able to reckon his costs at the same figure, any more than that every manufacturer would be able to agree upon the exact cost of any particular kind of product. But a fairly general knowledge of what the cost of products of the soil really are on the average would go a long way toward the establishment of fairly profitable selling prices.

It is by no means too much of an Utopian dream to believe that the time will come when the farmers will get together and think together enough to determine whether the cost of a bushel of potatoes is 20 cents or 50 cents, and when that time comes they will insist upon a price no less than the average cost with a fair profit added. It is an accepted principle of the manufacturing trade that the price to the consumer, the retail price, shall be fixed by the manufacturer, as well as the wholesale price, thus fixing the percentage of the middleman or middlemen.

When the proper time comes, the farmers will have the power in their hands to do likewise, for they can sell to the consumer direct, even as they are doing in a small way at the present time.

OPEN MARKETS CHEAPER GOODS.

F. C. Nunnic in Conservation says:

"A burning topic of today, is the high cost of living." While many reasons are cited for the existing high prices of food stuffs, there are many ways in which the dwellers in towns and cities may economize in purchasing supplies for the table, The majority of city dwellers today draw upon the whole world for their food supply and buy from the retail dealer. The telephone and delivery wagon entrench him in his position. Hence comes the difficulty often encountered in maintaining a public market in many of our town and cities.

A study of the whole subject of the public market leads to the conclusion that it is much more advantageous to the city consumer than to the progressive farmer, though there are certain advantages for the latter, such as the building up of a reputation for certain specialities, the placing of a premium on excellence, and receiving better prices than could be obtained from local retailers. The city consumer gets the products fresh from the farm; and at much more reasonable prices than might be charged by the retailer if there were no local market. Various investigations have shown that in some of our cities, certain staples cost two or three times as much as the farmers received for these products. A recent investigation in a Canadian city of upwards of 100,000 population showed that in no case was the scale of prices of the retailer for farm products as low as that on the public market, and, in some commodities, the price was about double. While there are many city residents who cannote get to the public market to buy, there are many who can, but who are not patronizing it. The difference in cost would pay handsomely. The custom of going to market is as old as city life itself, and as honourable as it is old.

"Where a public market has been opened in a town in which it had not hitherto existed, prices to the consumer have been lowered. In towns where they have been allowed to go out of existence, prices have gone up. Markets should be wholly for the use of the farmer and not dominated by hucksters."

FARMERS' MEETINGS.

The season of the fall meetings of the various associations of farmers, orchardists and stock beeeders is here, and we do not think we can offer any better advice to our readers, most of whom are practical farmers, than to take a day or two or three off and attend one or more of them.

We can imagine some who read this saying that they do not teach them anything new; that they do not hear anything at those places which they have not heard many times before, and which they do not already know. This may all be true to a certain extent, but yet we do not think that is a fair case against the principle of holding such gatherings.

It is a fact to be noticed that the farmers who attend those gatherings are among the best farmers in the various communities from which they come. We believe it is also a further fact that the men who are poor farmers do not attend such meetings. There are probably exceptions to both these rules, but on the whole we believe thay hold fairly true. Whether a man is a good farmer because he attends farmers' institutes and meetings of farmers' associations, or whether he attends these gatherings because he is a good farmer, does not matter. The idea is that the two go together to a very geeat extent. The best farmers as a general thing believe in such gatherings and try to make the most of them.

It is impoossible for a man to go to any of these meetings with the intention of participating in them, learning all that he can from the addresses, demonstrations and discussions, without learning something that will help him in his business, that will make him a better farmer.

There is another and a very good reason for attending these meetings and participating in the discussions. If a man is a good farmer and knows how to do any particular thing particularly well, he can help his fellow farmers by giving them the benefit of his experience and knowledge.

There is something in the very fact of getting together and talking things over, learning the other man's point of view, his method of doing things and his reasons why, that helps a man to do better.

A man has a strange disposition indeed if he is satisfied to go right along doing things in the same way with the same indifferent results every year after learning what other men are doing under different methods, and especially after talking it over with them and learning why they have done thus and so.

Attend as many farmers' institutes and meetions of farmers' associations as you are able, even with a little sacrifice. Other men think that they have found that it pays. Go looking for something and you will be likely to find it.

SEX CHARACTER.

A male animal, if said to have masculine character, must be of a positive masculine type, with a strong masculine head and horn. Weak heads and countenances, as usually possessed by steers, should be studiously avoided in a sire, A steery or negative kind of head and countenance is not indicative of prepotency, and an animal of this type will certainly never be an impressive sire. He may be just useful for begetting steers for commercial purposes, but never for begetting breeders' stock. Masculine style also includes a strong, thick neck, wide and well-developed shoulders, broad, "chine," wide and well-fleshy back and loin, good, deep and well-sprung ribs, thickness through the heart, and well-developed thighs. These are a few of the chief points which are included in the term "masculine character." Then again, the word character is applied in the same way with regard to femininity, and a cow should be as distinctly feminine in her chief points as a bull is strong in his.

A cow, like a bull, should never have a "steery" countenance, but should look "breedy" and refined about the head. She should be wide between the eyes and have a wide muzlle, but in all points where the male is strong and muscular the female should be refined. There should be a look of sweetness and general refinement all over a breedy-looking cow which is worthy to be described as of true feminine character. The word character, as applied to a breeding animal, includes much that is difficult to explain in writing, but at the same time it behoves all breeders of pedigree stock to see that the animals they breed possess it, and they will always find when it comes to a sale that very great value attaches to it. Likewise, in the showyard, an animal with strong character will always beat an equally good animal without that quality, and in the science of breeding every breeder of experience knows the value of it.

Alfalfa is Not a Plant.

An alfalfa field, sown with enthusiasm and some knowledge by a farmer, succeeded and became a beautiful thing, says the Breeders' Gazette. The farmer cut from it some fine crops of hay and was an alfalfa convert. Then he found it convenient to pasture the field. The horses and cows and pigs did well indeed in the alfalfa. More than ever he was a convert—but, alas, he left them in the fall. They nipped the tender shoots to the quick, they tramped the land into hard mud. The next year much of the alfalfa had perished and again the field was pastured much. Weeds and foxtail grass began to spring up, the alfalfa's doom was sealed. Finally, the man plowed the field in disgust. "I was deceived in alfalfa," he declared, "it is not adapted to our conditions."

Alfalfa is hardly a fit plant for being pastured hy grazing animals. They nip off the terminal buds, then the alfalfa can not make growth. They eat it to early in its growing period and neglect it after it has become nature and really needs cutting. Alfalfa pastures are fine for the animals, hut they had best be so wide that they are really alfalfa meadows. Then the mower should be taken in and hay made as though no stock was there. Thus treated and by taking off the stock early enough in the fall, the alfalfa pasture is a success and a great money-maker anywhere. The farmer's action was like killing the goose that lays the golden egg and then reviling her because she was not immortal.

The Management of Hired Help on the Farm.

There is a vast difference in farm methods so far as the management of the work of the place is concerned. In visiting several different farms in a day, one may notice the contrast to a marked degree, and draw his conclusion therefrom with a good degree of accuracy.

At one farm we could find fences down, weatherboards off the buildings, shingles loose, crops weedy, and a careful inspection will reveal many other odd jobs which ought to be done while the hired help may be found going slowly to their work, arguing over details and methods of working with the farmer himself, or else collected in groups telling jokes and stories. It is true that they will do some work during the day, but not enough to make it profitable for the farmer, when everything is taken into consideration at the end of any one month or year.

Another farm will show us a "cleaned up" appearance, with most of the "odd jobs" done. It will show the different men employed on the farm, busily engaged with some definite task which has been planned for them hy a "real farmer" and the directions he received from that farmer were short, simple and easy to understand. There was no chance for argument or debate, for the "help" realized that the farmer knew and understood his business.

The succes of this second farm must of course be greater than the first, because there is no waste of either work or energy.

A successful farmer recently remarked: "Show me the farmer who is unable to keep his men busy and I will guarantee him to be a failure in less than three years—and perhaps in six months."

And there is a large amount of truth as well as wise suggestion in what he said.

The plan book will help you to have things mapped out abead so that it will not be at all difficult for you to keep a force of men at work, or even a vest pocket notebook will help you greatly in this matter. But most of all, you must look ahead and learn to be a keen observer. It is a wise plan never to go to hed at night without knowing exactly what you should do the next day. Of course, circumstances will occasionally arise which will prevent you from doing just as you intended, hut you still have other days coming when this unfinished may he done.

Perhaps we ought to have a practical reason for this method of handling help, and it is hest illustrated hy supposing that the average cost of farm help is $10 a week. During a year, we will suppose that three men employed on your farm spend only 15 minutes each morning and afternoon in arguing and debating various questions, either with you or with the other help. This is a waste of a half hour of 312 working days, which is equal to more than 15 workdays, or more than two weeks for each man, making a total loss to you of $20 for each man, or $60 for all.

Now I do not mean by this that there never should he 15 minutes spent in talking or discussing methods, for it is a wise thing sometimes to do so, hut I am speaking of useless discussion and loafing. Nor is it wise to work without pause or rest at any hard labor, but even in this work some definite program could be arranged; that is, it may be understood pauses may be for rest only and not to fool away time. Such things may easily be brought ahout without seeming to be harsh or unjust in any way.

If you allow your men to waste this two weeks or more of time each year, it would he far better for you to keep them husily employed and give them a week's vacation on full pay. They would enjoy it better and you would receive much greater credit for it.

Again, many farmers prefer to pay their help low wages and "throw in" all vegetahles, etc., used by the "help," as well as firewood and house rent in many cases. This is all very good and proper if you make the person realize what he is receiving. Thus, if you pay him $1 a day cash and give him various things, figure it up in this way:

Wages for the vear .....$365.
House rent ....$50.

Thus you can make it clear to him that he is receiving really $40 a month, almost, instead of $30.

It is hest always to have a complete understanding with men before they are employed, and if you draw up an agreement in which your obligations and his are clearly set forth, it will he found profitahle. This is a simple matter and will prevent all sorts of trouhle and misunderstandings.

Help must he kept husy, hut it does not follow that they should be treated unfairly in any way. Give them a square deal and show your appreciation to the man who works to your interest hy advancing him to a better position; that is, if your work is divided so that this is possible.

Large farms should have the work arranged so that certain men may look after certain kinds of work, and in fact, all chores should be assigned to each man, so he will know exactly what is expected of him.

Make Tile Drains More Efficient.

It has been my experience that tiles as usually laid are to close together. Tile just from the kiln will absorb moisture, and in absorhing moisture they expand, and, when closely laid in the first place, they become so extremely tight that water cannot get through and consequently the drain is defective. Unless soil is very sandy, or is muck soil that easily granulates and washes into the tile, small crevices should be allowed occasionally, especially if the tile are such that fit evenly and closely.

Wherever it is possible so as not to hinder tillage we have "drops" that will let the water down into the tile more quickly. We chip off the end of two tiles so as to imake a small cavity at a place where we intend the drop to be and uprightly set a tile (or two, one on top of the other if the drain is deep) over this, firmly tramping the ground around it so that it cannot move from its position. Drainage must have quick service if it is to be effectual. Water remaining several days on crops, especially in hot weather, will ruin them, and often the main trouhle is where water remains unusually long that it is prevented from getting down into the tile hy the soil heing too stiff or the tile heing to tightly connected. An occasional drop will entirely eliminate the trouble.

Where there is a heavy fall or land is unusually sloping often much trouhle is experienced with the outlet of tile drain; the tile at the outlet, forced by the heavy pressure of water, wash away from their position. A huttment of stone and cement should he built around the last tile to hold it in position and prevent the ground from washing away from the tile. The outlet should also be screened to prevent the ingress of any wild animal that may be inclined to build a nest inside the drain. A small floodgate that swings out with the rush of water and falls back against the tile again when the water subsides can easily be erected and should be at the end of all tile drains that run into the open ditches.

WHEN ROOTS CAUSE TROUBLE.

If running tile drains under trees whose nature are to send their roots into tile to seek water you often meet with a proposition which is rather troublesome. You do not like to give up a certain tree as it furnishes shade for your stock and is the only tree in the field, and yet if you let it stand it is likely to give you trouble as we have known such trees to do, unless you know another way out. Here is a substantial way out of the difficulty. As far as tree roots are in danger of penetrating tile enclose tile completely with cement and all danger of trouhle is eluded for all time.

Let me mention here that it is not only trees that are troublesome near tile drains hut also perennial shrubs and hushes. Those are often far more liable to fill up tile with root growth than trees. The common elder is known to be one of the most troublesome. The roots of this hush force their way between the joints of the tile and soon form such a mesh and network of roots inside as to fill up tile completely and stop the flow of water. The quickest and least expensive way out of this difficulty is to clear the farm of all such rubbish, especially in the near vicinity of tile drains.—J. A. Raiser, in O. N. J.

Concerning Potato Troubles.

Editor's Note.—The following article has heen written by a resident of one of the rich agricultural districts of England. At our request he has written this article on potato spraying. He has had experience in that intensive farming district. It will he found of much henefit to the grower of potatoes in Canada.

Under the auspices of the Gloucester Education Committee, an experiment in the spraying of potatoes was conducted at Gloucester, England, during the year 1912 for the purpose of testing this means of preventing the Potato Disease (Phytophthora infestans) upon a crop of Duchess or Cornwalll potatoes.

The soil, which was of a rather gravelly nature, was given a light dressing of farmyard manure, supplemented hy an application of 3½ cwts. superphosphate, 1 cwt. sulphate of ammonia, and 1½ cwts. sulphate of potash per acre.

The seed was obtained from Scotland and planted on April 11th on land previously cropped with wheat, the rows heing 27 inches apart.

The objects of the experiment were to ascertain: (1) The effect of spraying in reducing the proportion of diseased potatoes and increasing the quantity of saleahle tubers. (2) The hest time to spray. (3) The advantages of spraying twice at intervals.

For the purpose of the experiment four equal plots were selected, each ¼ acre in extent and containing six rows of potatoes running the entire length of the field. As the plots were not measured off until the plants were in full growth, the cultural operations, i. e. manuring, planting, hoeing, etc., in each case were precisely the same. The plots were then treated as follows: Plot 1, unsprayed; plot 2, sprayed once, July 19th; plot 3, sprayed twice, July 19th and August 16th; plot 4, sprayed once, August 16th.

THE BURGUNDY MIXTURE.

The spray fluid used was the one known as the Burgundy Mixture, which differs lrom the well-known Bordeaux Mixture as the lime in the latter is replaced by common washing soda. The advantages of the Burgundy Mixture are: (1) it is considered more effective in comhating the disease; (2) it contains no gritty substances, which tend to choke the fine nozzles, and (3) it adheres hetter to the foliage. The mixture was made up as follows: sulphate of copper (hluestone), 20 lhs.; washing soda, 25 lbs.; water, 100 gallons. The quantities are sufficient to spray one acre of potatoes, with the average amount of well-grown tops. The cost, including material and lahor, works out at ahout 10s.—($2.43) per acre for one spraying.

CLIMATIC CONDITIONS.

The season of 1912 being one of the wettest on record, favored the development and rapid spread of the disease, and in many cases where spraying was not carried out, the crops were almost an entire failure. Rain fell on 42 of the 56 days from July 20th to September 14th, and the total rainfall in Gloucester for that period was 11.57 inches.

August 16th.—The effect of the first spraying (July 19th) on this date was very striking, the plants on the spray-

HORTICULTURE.

A Modern Apple Problem.

Of all the fruits grown in North America the apple easily leads in amount and instrinsic value. Apple planting has gone on with amazing strides within the last decade or two, and some orchardists, transportation companies and dealers have become nervous about the outcome.

Eighty years ago my grandfather planted apple orchards that were then called big, and mainly of seedlings, to make into brandy and for other and milder uses to some extent. My father made apple butter and boiled cider which were taken on flat boats down the Ohio river to be sold to southern sugar and cotton planters. Fresh apples were almost a burden and the old records show that picked winter apples sold for "$2 per two-horse wagon load," and "cider and apple butter apples (windfall), $1 per wagon load."

During later days we had quantities of apples which I helped gather from these same trees, and those later, that often sold at from 10 to 50 cents per bushel, according to quality and season. Commercial apple growing and marketing was even then in its infancy, which was in the '50's. and '60's. The price of apples of all grades was really advanced until now the very choicest apples bring from $2 to $5 and more per bushel box. Who says there are enough good apples, or apples of any kind, for the American people to eat at living prices, to say nothing of the foreign consumers? Certainly the consumers are not well satisfied with the situation as yet. They want more apples and cheaper ones.

The apple shippers are thoroughly organized, and I have been told that they parcel out the apple producing territories in ways that suit them. However this may be, the apple growers need to work more harmoniously and intelligentiy, and for their own good as a whole.

They need more organizations founded on the principles on which the various successful rural unions are based. And they need far more storage houses of their own on the farms and at the small trade centers. They should be able to command some sort of fair price for what they have to sell and not be compelled to sacrifice their crops at gathering time to whoever may come along, or send them to the overcrowded city markets.

All these things are parcticable and are done by some growers, but by far too few. It would help to steady the markets, and that is what is needed—steady markets—and not floods of apples at ruinous prices to the producers, and their apparent scarcity and prices that are unreasonably high to the consumers.

PROGRESS IN GRADING AND PACKING.

When we see rows and stacks of uniform, neatly, and above all, honestly packed boxes of apples, we mgy look back to the time of entire absence of anything of the kind in our apple markets. Barrels, hampers and even bags of apples sometimes were all that could be seen. There was no such thing as an apple box or strictly honestly graded and packed barrel to be found. All of them were faced with a better grade in size, color and conditions than that which lay under cover.

The first really honest apple package came from the Pacific coast. They had to put it up that way or not do business with profit at such long range. The western growers did their work so thoroughly that they sold a single bushel for as much as their eastern competitors got for a barrel, and the eastern consumers sometimes paid the freight. They are doing it yet.

It was said that the color did it. Some said it was the soil that made the color—that the east lacked volcanic ashes in the earth. Others say the sun shines brighter beyond the Rockies.

There may be something in all of this, but the greater lies in the conscience and care within the box. Apples that can be and are sold at fixed and fancy prices must have something about them even better than rich flavor in the minds of the buyers. A reputation for fair dealing goes a long way in a bargain. It is the exception rather than the rule to find a falsely graded or packed box of western apples, and barrels they never use.

Those who are really in earnest in getting down to business in the modern grading and packing of appfes have usually hired western teachers of experience, and are following their instructions. Let me cite a case that came directly under my observation last year. A young business man bought for $10,000 a farm of 35 acres mostly set to apples, in one of the good apple sections of Virginia. He had me look it over and advise him, and I urged the boxing of the better grades of fruit. The varieties are Winesap, Arkansas, York Imperial and Ben Davis. I told him to barrel most of the York Imperial and all the Ben Davis.

He looked up a market in a large manufacturing city, and having arranged to sell all the crop that was fit to grade to the standard in size, color and freedom from blemishes, he made the buyer take the Ben Davis in the trade at an even price. He got $2 per box by the carload for the entire crop of over 4,000 bushels, except the culls, which he put in barrels and sold at a fair price.

And another case I know about and saw in part was in the mountain section of southern Virginia. A young orchard last year had about a 1000 barrels of extra large and extra brilliant Winesap apples. The dominating directors of the orchard company

We pay highest Prices For RAW FURS And Remit Promptly

Sixty Thousand trappers send us their Raw Furs. Why not you? We pay highest prices and express charges, charge no commission and send money same day goods are received. Millions of dollars are paid trappers each year. Deal with a reliable house. We are the largest in our line in Canada. Write to-day

This oven test means bake-day "luck"

If your baking results vary, you may find the reason in the flour. For there is only one way that a miller can assure you constant success. An oven test must be made.

So we take ten pounds of wheat from each shipment delivered at our mills. We grind this sample into flour. Then the flour is baked into bread.

If this bread proves to be the "lucky" kind—high in quality, large in quantity—we use the shipment. Otherwise we sell it.

You buy luck in flour bearing this name.

No need to merely try your luck.

PURITY

"More Bread and Better Bread" and "Better Pastry Too"

529

got scared about the apple market early in the season, and being helped in this belief by a firm of speculators sold the lot at $1.50 per barrel, picked and hauled to the railroad, but not including the barrels and packing. In the bargain 30 barrels were retained by the company, and out of these 50 bushel boxes were selected and packed according to western rules. These were exhibited at a fair for a week and then sold for $3 per box. Who believes that eastern apples will not sell in boxes at fancy prices?

The eastern apples have the flavor, although their color is not always up to the western standard in this respect. The western apple is the aristocrat in outward appearance at least, but its eastern mate is a full match, all things considered, when properly grown, graded and packed. The wax on the skin is not quite so thick, because of the moister air, and will, therefore, not take quite so high a polish, but the quality is there.

One of the most skilful of the Hood River packing teachers told me last yaer that he had never packed better or handsomer apples at home than those he worked with in an orchard in Massachusetts. At the land show in New York city I judged some exhibits from Connecticut, New Jersey and Virg nia that were fully up to the standard in all respects except in brilliancy of color. At the second Indianna apple show there were many exhibits of this same character.

THE IMPORTANT QUESTION TO CONSIDER.

The vital question now is, will the eastern apple growers really mend their ways and grade and pack their fruit honestly and carefully? Will their barrels and boxes contain apples that will be alike from top to bottom.

There was a time when apples were simply apples. One variety was about as another to the average consumer. Now they are becoming discriminating and intelligently so. The Baldwin or Ben Davis will rarely satisfy the really sensible buyer who is getting apples for his personal or family use.

The sprightly flavors of Yellow Bellflower, Norther Spy and Esopus Spitzenburg are not forgotten. The tender, juicy Jonathan is called for, and rich, delicious Grimes is becoming well known and sought by lovers of good eating apples, and nothing of inferior quality will satisfy them. It is an encouraging sign to see intelligent and critical displays of fruit for sale. It shows that the public is being educated pomologically, and that the fruit vendors are keeping pace with the public demand for something really good.

Never so far as good apples go, will they ever be too plentiful, and they will rarely be to cheap for living profit to the grower. There will be unusual crops and the markets may be full to overflowing almost, but these occasions will tend to stimulate the general consumption or increase the "apple habit," as some call it.

The public ought to have apples and all fruits at moderate prices. But never fear of really choice apples carefully graded and packed, being very cheap. They will always find sale at top prices just as does the best beef, eggs and other articles of trade on which people live.—H. E. Van Deman, in Farm and Home.

Thinning the Fruit.

After the proper planting of the tree there is no other one factor as important in the production of high quality fruit as the proper thinning of the young fruit, which concentrates the entire forces of the tree in maturing large and perfect specimens rather than a host of imperfect "starved" fruit, says a writer in the Garden Magazine.

A tree that has had its set of fruit properly thinned each year, especially in its early stages, will bear annually and will not go on an annual expedition of restoration which usually occurs in apple trees from carrying to much fruit.

The proper time to thin fruit is directly after the "stoning" period. If you are a close observer you will have noticed that there is always a stage in the apparent development of the frvit, when it shows no growth and a certain number turn sickly yellow and fall off. That is the "stoning" period. In apples it occurs when the fruits are about the size of marbles. If you thin before this time you are very apt to have an unbalanced tree because some of the set will fall during the period; but directly after this stage has been passed is the time to thin. The tree is using what energy it has in forcing the growth of the fruit and the real object of thinning is to save undue effort by lessening the load. Very little energv is expended by the tree in r.pening the fruit.

The next problem: How many apples must be removed; how many left? It all depends on the tree. It is hard to decide intelligently without first seeing the tree, as no two trees are alike. Two trees of the same size might be totally different in their capabilities of bearing. We take as a basis a good healthly tree. Trees that are not in robust health will be the better for a severe thinning and younger trees just starting into bearing should be thinned more than older ones.

Remove any fruit showing signs of disease. This is important, as it will act as a sort of check upon any disease in your orchard. Be certain, too, that, in removing the fruit, you don't in any way injure the stems of the fruit you intend to leave on the trees, as they will fall off later if the stems are started from the spur by rough handling.

A good vigorous health tree just coming into bearing should have about two-thirds of its crop removed for the first season or two. This will give you one apple for about every cubic foot of space the foliage occupies. Always remove the fruit at regular intervals and rather toward the inside of the tree than the tips of the branches.

Where the fruit will get plenty of air and light for several succeeding years, an average of about one-half of the fruit that sets should be removed. By removing one-third of the crop from an old, well established tree, we get a harvest of fine big apples, the tree suffers no strain, and we are preserving for future use an orchard which might be rendered useless by a few seasons of overbearing.

Pears require thinning in much the same manner as apples, although they start bearing much earlier than apples and require earlier attention. Varieties differ in the amount of thinning requisite; I would not thin a Seckle pear as harshly as I would a Barlett, because we cannot expect to increase the size of a Seckle to equal a Barlett.

Peaches should be vigorously thinned. They are very free bearers and if left unmolested will carry tremendous crops of medium quality fruit. When properly thinned, however, the fruit attains a size and quality quite astonishing. Plums should not be thinned so vigorously as is recommended for the larger fruits. But thinning should be done, however, especially when the trees are just coming into bearing.

Grapes respond kindly to thinning and the vines will give large bunches of big, lucious berries instead of a large number of bunches with only small berries. Thin out the berries of each bunch, besides reducing the number of bunches, which should be cut off immediately after the berries are set, removing the smallest ones, Cut out altogether about one-half of the bunches; when the berries on the remaining bunches are about the size of small peas, they also can be thinned, reducing the number about one third. Use a pair of small scissors and a small crotched stick to support the bunches during the operation. The special thinning scissors are a most useful tool and indeed are essential to good work. Be careful at all times not to injure, in any way, the fruits that are left—a mere scratch now will become an ugly scar later.

Raspberries and blackberries are rarely thinned as it is too tedious an operation but currants and gooseberries that are to be used for table or exhibition purposes can be improved, both in size and quality. Cut off about half the number of bunches of currants; there is no need to thin the berries as with grapes. With gooseberries, just pick off the less promising fruits.—Farmers' Magazine.

DAIRYING.

Demonstration Cows.

Are your dairy cows making good profits? It is neceseary to find out, for at the famous National Dairy Show held in Chicago the last week in October, the authorities had gathered nine demonstration cows to prove for one thing how easy it is to lose good money feeding poor cows. All feed was weighed, all the milk was weighed and tested, the results of each day were placarded in bold figures above each cow. These two furnish the extremes for one day. A 7-year-old grade Jersey consuming 21 cents worth of feed produced only 13 cents worth of fat. This means that she incurred a loss of 8 cents for that day, that the feed cost of one pound of fat was 52 cents, that the feed cost of 100 pounds of milk was $2.53, and that for every dollar's worth of feed given to her she yielded only 62 cents worth of product.

Close to her was a 7-year-old grade Guernsey that on the same day consumed only 26 cents worth of feed; but notice what she did with it. She produced two and a quarter pounds of fat worth 79 cents showing there. fore a profit of 53 cents. Her pound of fat cost under 11 cents to produse, while every dollar's worth of feed gave three dollars' worth of product.

It has been demonstrated to Canadian farmers over and over again that similar conditions exist in each province. Just as soon as the keeping of dairy records becomes general, the profit from feeding cows may be expected to increase rapidly. The Dairy Division, Ottawa, gladly supplies feed record forms and a herd record book; apply for them today, and make sure, by systematic records, that each cow in your herd makes a good profit on her year's work.—C. F. W.

The Weighing of Butter and Cheese.

For a considerable time persistent complaints were made to officers of the Department of Agriculture at Ottawa by producers and vendors of dairy produce in Eastern Ontario and Quebec regarding the unsatisfactory methods by which butter and cheese were weighed in Montreal. So numerous were the charges and so serious the allegations that it was considered necessary by the Government to have the matter properly investigated. Consequently in the summer of 1912 a Royal Commission was appointed. The investigation by this Commission covered several months and involved the taking of evidence at many points and from many people who were considered likely to be able to shed light on the subject.

The Commission consisting of R. A. Pringle, Chairman, A. J. Hodgson, and J. S. Macdonell, completed their work some time ago and presented their report to the Honourable the Minister of Agriculture. In this, the advisibility of amending the Act respecting the weighing, measuring and gauging of certain articles of general consumption is recommended, as well as the appointment, under the control and direction of the Dairy and Cold Storage Commissioner, of a competent official, with headquarters at Montreal, who shall be charged with the duty of investigating the weights of cheese when shortages arise.

The Report of the Commission, consisting of a pamphlet of 17 pages, is ready to be sent to those who apply for it to the Publications Branch of the Department of Agriculture, at Ottawa.

A Necessary Food Supply.

Some comparisons of records indicate what infinitely better returns some dairymen obtain from their cows than do other owners of herds. One lot of milk testing 3.4, delivered at a factory last month was 21,580 pounds, the yield of 20 cows in two herds. Two other herds also totalling 20 cows and producing 3.4 milk gave only 12,380 pounds during the same month. These are not extreme comparisons because in many known cases the test was lower and the total pounds of fat delivered would be consquently far lower. Apart, however, from the weight of fat and the monetary value of the milk, think of one group of 20 cows giving in one month four and a half tons of milk more than the other group.

It needs no stretch of imagination to picture the consternation there would be if Canadian cows in general were as poor as these twenty Ontario cows: people need milk, plenty of it, as a good, nutritious and cheap food in these days of high prices. But if poor cows with only low yields are kept, where would be this necessary and universally appreciated food supply?

Fortunately, through systematic cow testing, these comparisons are possible, so that an incentive is furnished to every owner of a poor herd to keep cows more worthy the name of 'dairy' cows. Simple records, easily kept, give definite information acting as guide posts to herds bred and fed for large yields.—C. F. W.

The Milker.

In a recent bulletin issued by the Storrs Agricultural Experiment Station of Connecticut, the authors discuss the milker as a source of bacteria in milk and base their discussion on practical observation and experiments conducted at the station.

The kinds of bacteria, they say, that the milker is likely to introduce into the milk include nearly the whole list of those found in milk. It seldom occurs to the average milker that it is as necessary to wash the hands before milking as before eating a meal of vituals. The number that come from soiled clothes and dirty hands which get into the milk are large. The hands of a milker working around the farm during the afternoon were tested, just before milking time, for the number of bacteria that could be washed off in a quart of sterile water. The number was found to be 45,000,000. This washing did not remove all those that would have dropped off during the milking. Another experiment was tried to determine how many bacteria were left on the hands after thorough washing with soap and warm water. The number that could be washed off them in sterile water was found to be 900,000. These two experiments show that 98 per cent. can be washed from the hands.

The clothes of the ordinary dairyman carry immense numbers of organisms with dust from all sorts of contamination. The milker, has a much wider range for the collection of a larger number and greater variety of organisms than the cow. The only proper attire for a milker is a white suit and cap to be worn only at milking time. A white suit shows dirt very readily, and when made of white will last a long time and can be sterilized almost indefinitely.

The milker may not only be the source of a very large number of harmless bacteria, but the largest source of disease germs that get into milk. The milker may be the immediate source of disease germs or may transmit them to another person. The disease germs that get into milk

DON'T take our word only, but examine the Lister Engine at work alongside any other, compare its quality, efficiency, economy—In a word, let the engine speak for itself and you will become another delighted user of

Is your husband cross? An irritable fault finding disposition is often due to a disordered stomach. A man with good digestion is nearly always good natured. A great many have been permanently cured of stomach trouble by taking Chamberlain's Tablets. For sale by all dealers.

are largely from human origin, infectious diseases that pass from individual to individual. A grave mistake has been made in the past by allowing persons ill with contagious diseases to enter a cow stable or dairy where milk is handled. Many an epidemic of diptheria, scralet fever and typhoid has been traced to a case of illness on a dairy farm, which was not propetly quarantined and cared for. One high grade milk handling concern requires that if a case of contagious disease arises in the dairy of one of its patrons, that the milk supply be withheld till the patient has passed the danger limit of conveying the disease germs. The milk produced, however, is paid for during the quarantine. It is very difficult to make the average individual understand or even believe that our worst diseases are caused by special kinds of bacteria, and that these bacteria can be transmitted to a healthy individual, who is likely to contract the same disease.

Discarding Cows in City Dairies.

In city dairies cows are frequently discarded because they are no longer giving milk in paying quantities. The owner sells them and puts another fresh cow in their place. That would not be a sufficient reason for discarding a cow in a farm dairy if a good producer. In the latter good cows should not be discarded as long as they are able to produce well. The following reasons, however, would justify the farmer dairyman in getting rid of them: If they failed to reach a good standard in production if they were usually restless and irritable, if they were hard milkers, and if they failed to breed regularly.

The standard of production each dairyman must set for himself. In no case should it be less than 6000 pounds of milk a year. In many cases it may be more than that. To know what the cows are doing, of course records must be kept. The very fact of keeping such records will have a salutary influence on the dairyman. It will cause him to reach out for higher attainment.

When cows are irritable and restless and give trouble more or less because of such peculiarities, these may furnish justification for discarding them. Of course, it may be wise to retain such cows for a time in the absence of others not much more satisfactory, but as soon as circumstances will justify it they should be dispensed with.

Difficult milking may be caused by small teats, or by some peculiarity in the milk ducts and glands, which make it not easy to get milk from them. The small teats are, to some extent. peculiarities of breeds, and, therefore, are the outcome of inheritance. They make milking more tedious than it would otherwise be, since it makes stripping necessary. When the structure of the udder and teats is such that considerable strength is called for to get the milk the work of milking becomes much more laborious, and calls for a much longer time to do the work. It is a matter, therefore, of much practical moment that cows shall milk easily.

It is also a matter of prime importance in the farm dairy that cows shall breed regularly. In this way only can the maximum of milk flow be maintained. Of course, the great object in having dairy cows to produce young is to freshen them. If this does not take place at regularly recurring periods, as say once a year. the milk flow will not be sustained as it ought to be. When such cows fail to breed properly this in itself will furnish one important reason why they should be discarded.—Prof. Thomas Shaw.

Hard to get Good Cows.

The reason why more farmers are not finding dairying as profitable as it can easily be made is because they do not pay close enough attention to the business end of it. They are not building up good herds. They are making too much use of beef bulls rather than of dairy bred sires. It is practically impossible for the average farmer to buy high producing cows to start with. The only way he can get a profitable herd is to raise one from the cows on hand, or from a few good ones that he may be able to buy. In doing this he should pay special attention to the bull end of his herd. A poor bull is expensive to the dairyman at any price. The old saying that the bull is half the herd is quite true; in fact, it rather understates than over states actual conditions. This statement, however, should not be construed to mean that the sire has greater influence upon the offspring than the dam, as such is not the case, except where the dam is of mixed or uncertain breeding and the sire has been bred in one line for many generations, so that his characteristics have become fixed and he has become what is termed very prepotent. The statement is true only in-so-far as the sire has greater opportunity to reproduce himself than any individual cow in the herd.

SHARPLES MILKER

The most important factor in dairying today.

The Sharples Milker means cleaner milk—a problem of serious import to the modern dairyman. It means a large saving in milk production. And it eliminates the most disagreeable part of dairying — the drudgery of hand milking.

Think what it would mean to you as a dairyman to be able to save more than a third of your present payroll. Remember, too, that the Sharples Milker is on the job every day, year in and year out, saving you all kind of worry and care.

You keep your cows healthier with a Sharples Milker. Its gentle, uniform action is soothing and restful, fostering milk production and keeping teats and udders in perfect condition.

The Sharples Milker is easy to clean and keep clean. The parts that touch the milk are few and simple—quickly cleansed.

Over 80,000 cows are milked every day by the Sharples Milker—at an enormous saving of time, labor and worry to their owners.

Send for the Milker Book — it has some valuable information for cow owners.

Feeding the Ewes.

Let us suppose that lambing has commenced, and that there is a good crop of swedes awaiting. As each ewe brings forth her single or twins she is penned and fed on hay and a few pulped mangels—by this time a highly nourishing food—with some crushed oats, than which nothing is better. Measured, they may be given at the rate of a pint daily with a small addition of cake. Oats weighing 40 lb. the bushel before crushing would weigh slightly more than a half a pound by the pint, so that alone a pint of crushed oats is insufficient. As a milk-producing food they are excellent. Later on, when the flock is on the swedes, it may be well to add to them some crushed beans, or to mix cotton cake with the linseed cake. Ewes with twins need good feeding, and the remark applies equally to those which are suckling ram lambs intended for stock. This fare will last until they are turned into the fold, when the mangel feeding will cease. On some farms it is as convenient as it is economical to turn them on pasture land during the day, returning at night to the fold, and so to continue until the grass is insufficient for their requirements. Great care is needed to ensure sufficient food until the spring crops are ready for folding. There we have a great variety, including rye, winter oate, trifolium incarnatum, vetches, and sainfoin. On some farms rye grass will be available in addition. Winter oats should not be fed so late that the corn crop will be damaged, while vetches may be sown in successions, so that the flock will be carried right through the spring. For this reason an early action, is necessary. It is not advisable, however, to keep sheep on vetches too long a time, and the seed mixed with oats will produce a more useful food than vetches alone, while the plant will be kept on its legs instead of falling and wasting as it is liable to do upon land in high condition. Although sheep often go into a vetch crop which is as high as the hips, ther are some feeders who cut them, put them into covered racks, or hang them on the hurdles for the use of the lambs. So much depends upon the shepherd and his experience. A careful observer of the habits and preferences of sheep can take many liberties—if such they are—which others dare not attempt; but it is never well to risk the possibility of scour, which keeps the lambing back. It will be noticed that when sheep are folded on roots and forage crops they are not provided with water, but when confined to a minimum quantity of roots, with hay and corn, water is necessary, and it should be essentially clean.

The Lambs.

Unless lambs are required for very early markets, it is doubtful policy to force them. If it is intended to fatten them for sale when they have attained greater size, or to keep them for stock purposes, forcing is a mistaken policy. A flock master who is a good judge of sheep stands in a better position that his neighbours. There are few men who can select the most perfect lambs in their flock at an age when feeding commences, and yet this part of the business. One man is an excellent judge of a foal, and without seeing its sire or dam is able to place a value upon it; another will predict the future of a calf with nothing else to guide him. A good calf is more easily selected from a number, but even so it is not so easy to value it and to give it a place in a herd; but with the flock one lamb can be compared with twenty, or perhaps with a hundred, others, and still it may be difficult indeed to value it as a future stock sheep. It is this fact which places so many at a disadvantage, for the reason that with good ewes tupped by good rams good lambs are produced. But owing to the difficulty of recognizing them they go the same way as the rest, instead of being kept for sale for breeding. When lambs begin to breed well and are weaned the sooner they are fat and sold the better, if they are adapted to the early market.—James Long, in English Exchange.

Diseases of the Liver in Cattle.

It is not surprising that ruminants should be more subject to liver diseases than the horse, when we consider that the liver is the largest gland in the body, and remember the varied diet, the complex digestive system, coupled with the restrictive movements which domestication enforces upon animals of this description. The liver is situated in the abdominal cavity rather to the right of the diaphragm, i. e., the muscle separating the chest from the abdomen, and is distinguished by its bluish-brown or violet color. It is somewhat friable, and it is not notched at its outside in lobes like the liver of the horse, which has three well defined lobes. It is suspended by blood vessels, and is kept in position by three or four strong ligaments attached to the diaphragm. It is surrounded by a strong fibrous capsule or wrapping which penetrates even to the substance of the liver.

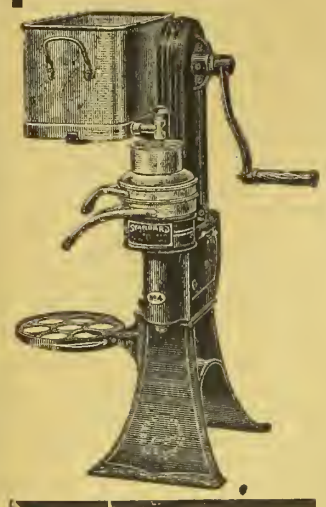
THE ANATOMY OR STRUCTURE OF THE LIVER.

The liver cell is an individual unit, like the citizen of a country. It has its birth, reproduction, and death, and during its life it is busily at work producing, principally, bile and animal starch (glycogen, and also, probably, other substances of value to the body. Millions of these cells combined and working for one common weal we speak of collectively as the liver. If we know the working only of one cell we have gained a very intelligent comprehension of what the functions of the liver are generally. The liver cell is a microscopic, being about one-thousandth of an inch in diameter, and has several sides. The divisions we perceive on the face of the liver with the unaided eye are lobules, or a community of cells. It is pierced by numerous minute passages, some for the entrance of crude material—viz., the blood from the digestive system—others for giving entrance to its own special food supply. Some cells of the liver have trouble thrust upon them in the form of cystic parasites—cancer cells, tubercle bacilli. Sometimes they suffer from a plethora of material to deal with—e. g., too much blood (from cold) or a too great richness in sugar or fat. Being unable to deal with this plethora of material, this we call congestion, occasionally they go out on strike, and no bile is secreted, or only in small quantities. Occasionally the main road is blocked up with gall stobes to the gall duct or from gall bladder, in both of which cases we speak of the condition as jaundice.

BILE; ITS COMPOSITION AND FUNCTIONS.

This yellowish green fluid is probably produced in the liver cell from albuminous compounds; it contains from 15 per cent. of solid matter, the principal part of which consists of two acids, glyco-cholic and tamocholic (sweet bile, and literally bull or ox bile), the latter containing all the sulphur of the bile, to which the bitter taste is due; in combination

Where Do We Hide Its Brains?



Said a dairyman: "Where do you hide the brains of that machine?" "Why! what do you mean?" asked our surprised agent. "Well," said the dairyman, "that Standard Cream Separator of yours is such a really wonderful machine, it seems to know just what to do and how best to do it' and it does some things so nuch better than any other separator I ever saw; that it really seems as if it must have brains of its own."

When you come to think of it, it does seem as that dairyman said, that the

Standard

cream separator must have brains of its own. For instance, think how intelligently it looks after the oiling. You never have to think about seeing if there is enough oil in the neck bearing or any other part. The Standard attends to the oiling of every gear and bearing itself. It also keeps the discs clean by automatically deposting the foreign matter from the milk in the space between the bowl and the disc edges. And it also automatically brings all the gears to a stop the moment you let go of rhe handle. But the way it gets the cream from the milk, only allowing one tenth of a pound of butter fat to escape in every 1,000 pounds of milk skimmed, would do credit to the best money-making brains in the land. See this "brainy" money-making machine at our agents, or write direct for catalogue and easy payment offer.

with soda, are the main constituents. Another constant consrituent is cholestrine (chole bile, stereas solid), a substance which when in excess forms biliary calculi (it also occurs in yolk of egg, beans, peas, wheat, and other plants). Bile first neutralises the acid contents of the stomach; secondly it promotes the peristaltic or circular contraction of the bowls; it assists in the decomposition of fats by partial saponification; it acts as an antiseptic in checking fermentation, and also in keeping down, or limiting, the bacterial flora. The greater part of it is absorbed, like saliva, in a more or less modified form. Another function of the liver cell is to reduce thrown-out tissue of nerve, muscle, and proteid matter in urea or uric acid, which eventually is excreted by the urine. Some physiologists believe that a large portion of the starch and sugar taken in the food, and absorbed and altered by the intestine ferments, is converted into fat and passed on by the white corpuscles to be deposited in other parts of the body.

Another and very important function of the liver cell is the manufacture of glycogen, or animal starch; this is formed and stored up in the cell, converted into sugar, and given out in small quantities as required to the blood. This warehousing, or provision, is of the greatest importance. It is in the nature of banking account, which in times of stress, hunger, starvation, or fever, the tissues can draw upon for supplies of nourishment for the maintenance of life. In hibernating animals large quantities are stored up by the liver in the autumn for consumption by the fody during the winter period of repose.

The cell manufactures glycogen principally from carbohydrate (starch or sugar), and little or none from a pure proteid diet.—Southern Vet.

Halifax Market Report.

GRAIN.—Oats, 49c. to 57c. bus., bagged; Peas, $3.00 to $3.25, bag, 98 lbs.

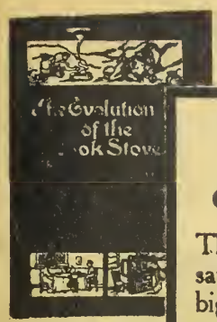
To Clean White Feathers.

Make a strong suds of luke-warm water and ivory or wool soap. Put the feather into the suds and wash thoroughly, being careful not to break the shaft. Rinse well in luke-warm water and draw between the fingers to remove as much water as possible. Spread on a sheet of clean wrapping paper one-fourth to one-half cup of corn starch until it is dry and fluffy.

One is apt to become discouraged during the process and think the feather is tuined, but if directions are carefully followed she will feel more than repaid by the final results. The corn starch keeps the barbules from sticking together and makes the feather appear light and fluffy.

If the feather is to be curled, cover with tissue paper. Pull out from under the paper three or four barbs of the feather and draw over the edge of a very dull knife. Repeat until all the barbs have been curled.—Charlotte E. Carpenter, Colorado Agricultural College.



Let us send you our book "The evolution of the Cookstove"—an interesting history of cooking. It also gives a clear, simple description of the Dominion Pride Range—complete in every detail. Reading this book is like examining the range itself.

Irate doctor, seeing a bottle of quack medicine beside his patient: "Why didn't you tell me you were taking this wretched stuff?" Patient: "Well, it's my wife, sir. She says, 'I'll dose you with this and the doctor'll try his stuff, and we'll see which'll cure you first.'"

THE HORSE.

Conditioning Horses for Sale.

In order to sell horses to the best advantage, whether privately or otherwise, it is always desirable to condition them in a suitable manner, so that they may be presented to prospective buyers in the most favorable light. Such conditioning for sale is everywhere fully recognized as a perfectly legitimate practice, being in effect equivalent to the getting up of horses for the show ring, and it has nothing in common with tactics of second-rate horse dealers whose doping practices are so often designed to deceive the unwary, and, if possible, to mask some unsoundness, blemish or vice. A breeder or farmer is, indeed, culpably neglectful of his interests if he fails to bring a horse for ward in good condition, for the omission will in all probability entail a certain depreciation in its selling value. The intrinsic worth of horses and their good points are usually only fully brought home to buyers when looking well fed and sleek, with carefully groomed coat and trim main and tail. Even many experienced horsemen are notoriously bad judges of a horse in the rough, and quite unable properly to appreciate inherent good shape and looks when more or less obscured owing to the animal being in that unkempt state. Hence horses sold in the rough in most cases fail to make their full value.

FEEDING FOR CONDITION.

As regards the process of getting up a horse for sale, the leading principle is to feed it up well on corn, so as to bring it into a well-fleshed condition. It will be advisable, in fact, to have it a bit on the fat side, for this imparts nicely-rounded contours, which appeal so much to the eye of the average buyer. If the horse is poor, or in rough condition, and is to be prepared for sale quickly, there should be included in the diet, besides a generous supply of oats, some dry bran and a little barley meal, both of which will help it to put on flesh more rapidly, while the use of linseed cake or linseed meal is also to be recommended, these foods have a distinctly fattening effect, and they also improve the appearance of the coat, which is an important consideration, Locust beans comprise another food that specially promotes rapid improvement in the condition when the horse is poor.

Next to presenting it in a well-fed condition, the great secret of showing a horse in an advantageous manner, to an intending buyer consists in having the animal full of mettle, or "above itself," as it is commonly termed. Dealers always make a great point of this, well knowing how efficacious the plan is. To this end the horse should be kept rather short of work, though it must, of course, be given a modicum of exercise every day, if only to prevent it from becoming unmanageable and to keep its legs fine. This line of treatment in combination with liberal corn-feeding will engender the requisite freshness or high spirits, causing the animal to carry itself with a special air of spritliness, to arch its neck in taking fashion, and to step out with unusual freedom and vim. If a horse has been kept in hard work, it will certainly be desirable to discontinue this and work it very moderately during the last three or four weeks before it is put up for sale, otherwise it will not be possible to bring it into the required good bodily condition. If much pulled down in consequence of having been severely work

Horsemen Attention!

Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Thier use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Glanders, Spavins, Pinkeye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Troubl, Fevers, Cuts, Sores and will remove bunches of all kinds

¶An Advertisement in the Maritime Farmer will sell your surplus stock--Try it.

ed, the best plan undoubtedly will be to ease it up for a short while, merely giving a little slow exercise, in order to allow it to recover both its flesh and its freshness. Unless some easement is given as regards the work in these circumstances, the horse will respond but very little, if at all, to a special feeding-up regime within a reasonable limit of time.

GROOMING AND TRIMMING.

An important detail furthermore, is to get the coat into tip-top order, for which purpose plentiful and vigorous grooming is called for, while a good bloom on the coat will also be materially promated by keeping the animal rugged. The mane and tail should be carefully trimmed. A badlar, will detract considerably from ly-kept, disordered mane, in particu- the appearance of the horse, the unfavorable impression it is lible to create being out of all proportion to the actual significance of this in itself a quite immaterial point. It is surprising how much the appearance of horses in the rough can be improved and smartened up simply by thinning and straightening their unkempt mane and trimming the tail. To make the horse's mane look well, it needs to be freely thinned out at the roots, so that it may fall flat against the side of the neck and leaves the line of the crest entirely unobscured. It should then be shortened to the required extent and given a straight edge by carefully pulling it strand by strand. To make it lie well it may be brushed over with a damp water brush twice a day. In the case of a horse that has come up from grass in the rough the most effective way of training the mane to lie as it should do is to keep it plaited for a week or so. The tail is simply squared at the end and gently combed out to remove dead hairs. It often adds to the smart appearance of a norse if it is shown to the prospective buyer with the mane neatly plaited. Dealers frequently favor this plan, but it will only look well if properly done. There are several ways for plaiting the mane, and in the case of carthorses straw is very commonly used for that purpose. These also often have their tail done up with strands of straw when shown for sale.

SHOEING.

Another point to be attended to is the shoeing. It should preferably wear new shoes—that is, shoes that have not been on for more than, say, a week or so, and the feet should be nicely trimmed by the blacksmith and left as neat as may be. Feet that are newly shod will impress the average purchaser much more favorably and appear to him to look more shapely than when the shoes are old and more or less worn down. Supposing one is obliged to sell a horse in the rough, owing to its not being convenient to stable and condition it for a while, it will at any rate always pay to have the animal shod, besides trimming mane and tail, as noted. It is a mistake to show a horse unshod. The mere fact of unbroken young horses being shod will often make them sell for a considerable amount more than would have been offered had they been presented without shoes.—Argus.

"There could be no better medicine than Chamberlain's Cough Remedy. My children were all sick with whooping cough. One of them was in bed, had a high fever and was coughing up blood. Our doctor gave them Chamberlain's Cough Remedy and the first dose eased them, and three bottles cured them," says Mrs. R. A. Donaldson, of Lexington, Miss. For sale by all dealers.

Handling Hen Manure.

One little product of great value which goes to waste on almost every farm is hen manure. Poultry manure is the most valuable fertilizer produced on the farm. It is so rich that ordinarily it cannot be safely applied in the state it is taken from the dropping boards but should be weakened by mixing with wood ashes and compost. Applied in this way, the fertilizing value of the manure dropped during the winter from 100 hens is close to $100. Those who have found out the real value of hen manure allow none of it to go to waste. It pays those owning more than 30 hens to have a shed near the poultry house into which to place the droppings during winter. Land plaster should be sprinkled over the droppings each time after placing them in the shed to prevent loss of fertilizing elements. The manure is best applied to the land with a fertilizer drill as we do commercial fertilizer. To do this we must first pulverize the dry drop pings. One winter's accumulation with ashes and compost added will cover several acres. The effect of the application is very noticeable as treated areas have a much ranker growth of vegetation than untreated portions. On most farms poultry manure is considered to small an item to bother with. Thus without knowing it, the farmer allows one of his most valuable by-products to go to waste. This fact is the more deplorable since poultry manure requires such little labor and expense to handle and results are so encouraging. Many farmers save their poultry manure but do not do it propecly. If piled in a heap outs de the manure loses over half its value through evaporation and decomposition. It is too valuable a product to be treated in this way but should be kept dry and some other substance mixed with it to lessen the loss of its value. Hen manure and ashes are very valuable in fertilizing orchards, also potato lands. The best piece of corn I ever saw was fertilized with hen manure. In the garden it is of especial value. A teaspoonful placed with the seed in hills of cucumbers, melons, etc., works wonders. I believe that considering the expense and labor of saving that hen manure properly handled is the most paying operation that can take place on any farm.—C. J. G.

A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. Write to-day. Address: Mrs. M. Summers, Box. 309 Windsor, Ont.

Using Perches With Bark On.

We have written many years against using perches with bark on, and yet we find how many people with old-fashioned notions still use them. We often ask them why they do this. Sometimes we are told it is because the birds can hold on better with their feet if the rough bark is on, while others say it is natural to leave the bark on the wood. They argue when fowls and pheasants sleep out in the woods they sit on the branches and the bark is there. There is absurdity in this argument.

When fowls sit upon trees' in ninety-nine cases out of a hundred the are growing and the bark is green, therefore the sap runs under the bark, and if the vermin were to get underneath the bark they could not live in it.

Then, again, the trees are outside in the open, and the branches are exposed to the frost and wet weather. The probabilities are, if the branches were alive which the fowls were sitting upon, there would be very few vermin corrode there on account of their being exposed to all weathers. It is different altogether in a poultry house where the bark is on the perches. Thousands of vermin corrode under the bark and irritate the fowls during the night, then in the daytime most of them get back to their hiding-place.

The perches should always be perfectly smooth and clear, so that there is no opportunity for the vermin to corrode there. These pests breed very fast in hot weather. To make sure of the perches it is well to give them a good soaking with paraffin oil all over; it will not hurt the fowls in the least.

Use your gentlest voice at home.

Respect your boy or girl. They may easily outshine you some day. At any rate, they will reach their best only with your encouragement.

A good many folks, and young folks at that, spoil their teeth by using them for nutcrackers. Too costly, friends. Take the hammer, or get a nut-cracker; it only costs a few cents. You can buy it a great deal easier than you can get a new tooth.

WOODEN pails and tubs are as much ou of date as the scythe and the sickle—and just as unpractical.

Eddy's Fibreware

gives superior results—for less money. Pails, tubs, dairy utensils, etc.. made of this material are light, tight and durable. They have no hoops to drop off—no seams to crack. And they outwear the wooden articles many times over.

Ask Your Dealer

"Just as Good as Eddy's Matches."

A Prize Food for Prize Stock

You can raise "fall" pigs and have them fine and fat for the May market. All you need is a little extra care and

"INTERNATIONAL STOCK FOOD."

Feed "INTERNATIONAL STOCK FOOD" with a combination of ground corn, oats and rye—and they will not only keep healthy, but also fatten up in a way to astonish your neighbors. The average pig does not digest more than half of the grain fed. The other half is wasted. "INTERNATIONAL STOCK FOOD" tones up the digestive apparatus, insures perfect digestion, and thus saves this waste in grain. "INTERNATIONAL STOCK FOOD" is a purely vegetable preparation—a wonderful tonic—that keeps hogs well and vigorous, and protects them against the ravages of Pneumonia and Cholera. 78

Make a nice profit on your "fall" pigs by feeding "INTERNATIONAL STOCK FOOD." Get a pail to-day from your dealer.

Crop Bound.

One remedy that will sometimes effect a cure is a teaspoonful of sweet oil, then manipulate the crop contents with the fingers for some time. If this does not afford relief, try suspending the bird by the legs and carefully try to work the contents back to and out of the mouth. After the crop is emptied give no food for 36 hours, but allow the bird to drink a little water containing ' 20 grains of bicarbonate soda to a quart of water. Then feed sparingly with bread softened with milk. If the fowls are valuable a surgical operation is generally successful when done in time by cutting through the outer skin at the upper part of the crop, making an inch iocision, then through the wall of the crop itself and empty by using the finger. Then wash out the interior with a one per cent. solution of carbolic ac d. Sew up the cuts separately with white silk, leaving the ends hanging outside. Give only water containing two drops of salicylic acid per quart for two days then feed a little bread softened with milk. In a week if the wound is healed draw out the thread.

Clam shells are valuable, but are not so plentiful, commercially.

Business Methods on the Farm.

A good business man aims to have everything convenient and such a condition that he can realize a profit.

Ship-shod methods would quickly invite disaster.

The men who succeed in business are careful, energetic and enterprising.

While this is true of the business man, it is equally true of the poultry man.

The merchant in arranging his store has everything convenient, so that he can quickly place his hand on what he wants. He aims to save time and steps. The poultry man in building his houses should use the same precaution arranging them so that the most work can be done with the least labor, and in the quickest time.

The question of feed comes next. For best results in manufacture, the best raw material is used. So with poultry. For good laying, there must be good feed. Simply because a certain article of food is cheap, is no argument that it will do to feed. What is wanted in this kind of food that has in it the largest amount of ingredients to make eggs. Such an article is cheap at almost any price. Damaged or burnt grain is entirely unfit for food—not only is it injurious, but it is decBBB BBB BBB BB ious but it is devoid of the elements necessary for making eggs. Hence, it is dear food even at half the price of good grain. It s poor economy to buy something that is cheap in price only.

Then comes labor. Cheap labor is not economical labor by any means; some mean are dear at one dollar a day, while others are cheap at twice that amount. A man's work must not be measured by his pell-mell, rush style. It is how quickly he does rush style. It is not how quickly he does the job, but how well.

Sex-Limited Inheritance.

A considerable number of characters have been found to behave differently in the two sexes. One of the most striking cases of this kind is the barring of the feathers in the Plymouth Rocks. If a barred Plymouth Rock male be crossed with a Brown Leghorn hen all of the progeny will be barred like the Plymouth Rocks. But if a barred Plymouth Rock female be mated with a Brown Leghorn male, the results are quite different. All the male offspring will be barred, while all the female offspring will be black. The female barred Rock transmits the black color to both male and female offspring, and this black color covers up the Brown Leghorn color; but the barred Plymouth Rock female transmits the barring only to her male offspring.

The same thing is true of the high egg-laying capacity in fowls. If a male is pure with reference to high egg-laying capacity, then he will transmit high egg-laying quality to all his offspring, both male and female, though of course there is no way of telling that a male has high egg-laying capacity except from his female offspring. But a female of high egg-laying quality transmits this capacity only to her male offspring. It follows that a female can inherit high egg-laying capacity only from her sire, while a male may inherit this character either from his sire or his dam, or both, This shows that in order to develop a strain of fowls having the high egg-laying capacity we must give even more attention to the males used than to the females. A daughter of a hen with high egg-laying capacity is of no value as a breeder, unless this daughter has inherited this high egg-laying capacity from her sire.

Many other important applications of the various laws of Mendel could be given, but it is hoped that the illustrations and the preceding articles wil, enable the practical breeder to make use of these laws in his operations.—W. J. Spillman, in Breeders' Gazette' Gazette.

Champion Hen.

The college hen that attracted world wide notice by laying 99 eggs in 100 days has broken the world's record of 282 eggs in a year by having laid 283 eggs nine days before the year expired. Since September 16 she has laid an egg every day, and the prospects are that she will continue to da so at the end of the year for which the record is kept. She lives and lays at the Oregon Experimental College. The highest previous record was made by a Missouri Experiment Station hen which laid 281 eggs in a year.

BOYS AND GIRLS, NEVER BEFORE IN CANADA HAS SUCH A GRAND PREMIUM BEEN OFFERED AND SO EASY TO GET.

READ WHAT THIS GRAND SCHOLAR'S OUTFIT CONTAINS.

1 large leather bound school bag, 1 dozen fine quality H. B. pencils, 6 steel tip pen holders, 1 dozen 292 pennibs, 50 sheets of writing paper, 1 dozen envelopes to match, 1 box of 15 water color paints with brushes and pots, 10 beautiful drawing crayons of different colors, 1 fine quality steel blade penknife, 1 large hardwood slide top pencil box, 1 complete printing outfit containing type, ink, tweezers and stamping pad, 1 twelve inch ruler, 1 large memorandum book, 1 complete dater good for five years, 1 large rubber eraser, 1 steel blade pencil sharpener, and last but not least, 1 Swiss warbler the greatest invention for imitating birds and animals.

Think of it, this scholar's complete outfit is FREE. We are determined to sell a million bottles of Rose Perfume this year, and are sparing no expense to reach this mark.

Rose Perfume is a great improvement on the old style of perfume and goes twice as far. Everybody buys it because it is so good, and a present is given away with every bottle.

We give you one of these grand scholar's outfits **IF YOU WILL AGREE TO SELL ONLY 30 BOTTLES OF ROSE PERFUME AT ONLY 10c PER BOTTLE.** Any boy or girl can sell 30 bottles easy. No trouble at all.

We send you the Rose Perfume free and trust you until sold. Simply send us your name and address to-day. Every girl and boy should win one of these grand scholar's outfits.

Try. If you can't sell the Rose Perfume send it back to us.

Address to-day **THE ROSE PERFUME CO., Dept. S., 50** Toronto, Ont.

Pratts Animal Regulator

DO you want to make more money? Then start, RIGHT NOW, to feed Pratts to your horses, cows, sheep and hogs. Pratts CAN'T hurt them, because it is NOT a stimulant but a mild, natural tonic and health regulator. Every ounce of feed is converted into rich, red blood and firm, solid flesh with the aid of Pratts.

"Your Money Back If It Fails."

Order a pail TO-DAY.

At your dealer's, $3.50 per 25-lb. pail; also in packages at 25c., 50c. and $1.00.

PRATT FOOD CO. of Canada, Limited, TORONTO. S-4

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

CHAPTER XV.

I Make Another Beginning.

Mr. Dick and I soon became the best of friends and very often, when his day's work was done, went out together to fly the great kite. Every day of his life he had a long sitting gt the Memorial, which never made the least progress, however had he labored, for King Charles the first always strayed into it, sooner or later, and then it was thrown aside, and another one begun. This patience and hope with which he bore these perpetual disappointments, the mild preception that he had that there was something wrong about King Charles the First, the feeble efforts he made to keep him out, and the certainty with which he came in, and tumbled the Memorial out of all shape, made a deep impression on me. What Mr. Dick supposed would come of the Memorial, if it were completed; where he thought it was to go, or what he thought it was to do; he knew more than anybody else, I believe. Nor was it all necessary that he should trouble himself with such questions, for if anything were certain under the sun, it was certain that the Memorial never would be finished.

It was quite an affecting sight, I used to think, to see him with the kite when it was up a great height in the air. What he told me, in his room, about his belief in its disseminating the statements pasted on it, which were nothing but old leaves of abortive Memorials, might have been a fancy with him sometimes; but not when he was out, looking up at the kite in the sky, and feeling it pull and tug at his hand. He never looked so serene as he did then. I used to fancy, as I sat by him of an evening, on a green slope, and saw him watch the kite high in the quiet air, that it lifted his mind out of its confusion, and bore it (such was my boyish thought) into the skies. As he wound the string in, and it came lower and lower down out of the beautiful light, until it fluttered to the ground, and lay there like a dead thing, he seemed to wake gradually out of a dream; and I remember to have seen him take it up, and look about him in a lost way, as if they both had come down together, so I pitied him with all my heart.

While I advanced in friendship and intimacy with Mr. Dick, I did not go backward in the favor of his staunch friend, my aunt. She took so kindly to me, that, in the course of a few weeks, she shortened my adopted name of Trotwood into Trot; and even encouraged me to hope, that if I went on as I had begun, I might take equal rank in her affections with my sister Betsy Trotwood.

"Trot, said my aunt one evening, when the blackgammon-board was placed as uaual for herself and Mr. Dick, "we must not forget your education."

This was the only subject of anxiety, and I felt quite delighted by her referring to it.

"Should you like to go to school at Canterbury?" said my aunt.

I replied that I should like it very much, as it was so near her.

"Good," said my aunt. "Should you like to go to-morrow?"

Being already no stranger to the general rapidity of my aunt's evolutions, I was not surprised by the suddeness of the proposal, and said: "Yes."

"Good," said my aunt again. "Janet, hire tire the grey pony and chase to-morrow morning at ten o'clock, and pack up Master Trotwood's clothes to-night."

I was greatly elated by these orders; but my heart smote me for my selfishness, when I witnes*ed their effect on Mr. Dick, who was so low-spirited at the prospect of our separation, and played so ill in consequence, that my aunt, after giving him several admonitory raps on the knuckles with her dice-box, shut up the board, declined to play with him any more. But, on hearing from my aunt that I should sometimes come over on a Saturday, and that he could sometimes come and see me on a Wednesday, he revived; and vowed to make another kite for those occasions, of proportions greatly surpassing the present one. In the morning he was down hearted again, and would have sustained himself by giving me all the money he had in his possession, gold and silver too, if my aunt had not interposed, and limited the gift to five shillings, which, at his earnest petition, were afterwards increased to ten. We parted at the garden-gate in the most affectionate manner, and Mr. Dick did not go into the house until my aunt had driven me out of sight of it.

My aunt, who was perfectly to public opinion, drove the grey pony through Dover in a masterly manner, sitting high and stiff like a state coachman, keeping a staedy eye on him wherever he went, and making a point of not letting him have his own way in any respect. When we came into the country road, she permitted him to relax a little, however; and looking at me down in a valley of cushion by her side, asked me whether I was happy?

"Very happy indeed, thank you, aunt," I said.

She was much gratified, and both her hands being occupied, patted me on the head with her whip.

"Is it a large school, aunt?" I asked.

"Why, I don't know," said my aunt. "We are going to Mr. Wickfield's first."

"Does he keep a school?" I asked.

"No Trot," said my aunt. "He keeps an office."

I asked for no more information about Mr. Wickfield, as she offered none, and we conversed on other subjects until we came to Canterbury, where, as it was market-day, my aunt had a great opportunity of insinuating the grey pony among carts, baskets, vegetables, and hucksters' goods. The hair-breadth turns and twists we made, drew upon us a variety of speeches from the people standing about, which were not always complimentary; but my aunt drove on with perfect indifference, and I dare say would have taken her own way with as much coolness through an enemy's country.

At length we stopped before a very old house bulging out over the road; a house with long low lattice-windows bulging out still farther, and beams with carved heads on the ends bulging out too, so that I fancied that the whole house was leaning forward, crying to see who was passing on the narrow pavement below. It was quite spotless in its cleanliness. The old-fashioned brass knocker on the low arch door, ornamented with carved garlands of fruit and flowers, twinkled like a star; the two stone steps descending to the door were as white as if they had been covered with fair linen; and all the angles and corners, and carvings and mouldings, and quaint little panes of glass, and quainter little windows, though as old as the hills, were as pure as any snow that ever fell upon the hills.

When the pony-chaise stopped at the door, and my eyes were intent upon the house, I saw a cadaverous face appear at a small window on the ground floor (in a little round tower that formed one side of the house), and quickly disappear. The low arched door then opened, and the face came out. It was quite as cadaverous as it had looked in the window, though in the grain of it there was that tinge of red which is sometimes to be observed in the skins of red-haired people. It belonged to a red-haired person—a youth of fifteen, as I take it now, but looking much older—whose hair was cropped as close as the closest stubble; who had hardly any eyebrows, and no eyelashes, and eyes of red-brown, so unsheltered and unshaded, that I remember wondering how he went to sleep. He was high-shouldered and bony; dressed in decent black, with a white wisp of a neckcloth; buttoned up to the throat; and a long, lank, skeleton hand, which particularly attracted my attention, as he stood at the pony's head, rubbing his chin with it, and looking up at us in the chaise.

"Is Mr. Wickfield at home, Uriah Heep?" said my aunt.

"Mr. Wickfield's at home ma'am," said Uriah Heep, "if you'll please to walk in there;" pointing with his long hand to the room he meant.

We got out; and leaving him to hold the pony, went into a long low parlor looking towards the street, from the window from which I caught a glimpse, as I went in, of Uriah Heep breathing in to the pony's nostrils, and immediately covering them with his hand, as if he were putting some spell upon him. Opposite to the tall old chimney-piece, were two portraits; one of a gentleman with grey hair (though not by any means an old man) and black eyebrows, who was looking over some papers tied together with red tape; the other, of a lady, with a very placid and sweet expression of face, who was looking at me.

I believe I was turning about in search of Uriah's picture, when, a door at the farther end of the room opening, a gentleman entered, at sight of whom I turned to the first mentioned portrait again, to make quite sure that it had not come out of its frame. But it was stationary; and as the gentleman advanced into the light, I saw that he was some years older than when he had had his picture painted.

"Miss Betsey Trotwood," said the gentleman, "pray walk in. I was engaged for a moment, but you'll excuse my being busy. You know my motive. I have but one in life."

"Miss Betsey thanked him, and we went into the room, which was furnished as an office, with books, papers, pin boxes, and so forth. It looked into a garden, and had an iron safe let into the wall; so immediately over the mantel-shelf, that I wondered, as I sat down, how the sweeps got round it when they swept the chimney.

"Well, Miss Trotwood," said i-Mr. Wickfield; for I soon found that it was he, and that he was a lawyer, and steward of the estates of a rich gentleman of the country; "what wind blows you here? Not an ill wind I hope?"

"No," replied my aunt, "I have not come for any law."

"That's right, ma'am," said Mr. Wickfield. "You had better come for anything else."

His hair was quite white now, though his eyebrows were still black. He had a very agreeable face, and, I thought, was handsome. There was a certain richness in his complexion, which I had been long accustomed, under Peggotty's tuition, to connect with port wine; and I fancied it was in his voide too, and referred his growing corpulency to the same cause. He was very cleanly dressed, in a blue coat, striped waistcoat, and nankeen trousers; and his frilled shirt and cambric neckcloth looked unusually soft and white, reminding my strolling fancy (I call to mind) of the plumage of the breast of a swan.

"This is my nephew," said my aunt.

"Wasn't aware you had one, Miss Trotwood," said Mr. Wickfield.

"My grand-nephew, that is to say," observed my aunt.

"Wasn't aware you had a grand-nephew, I give you my word," said Mr. Wickfield.

"I have adopted him," said my aunt, with a wave of her hand, im-

AILING WOMEN OF MIDDLE AGE

Mrs. Doucette Tells of her Distressing Symptoms During Change of Life and How She Found Relief.

Belleville, Nova Scotia, Can.—"Three years ago I was suffering badly with what the doctors called Change of Life. I was so bad that I had to stay in bed. Some friends told me to take Lydia E. Pinkham's Vegetable Compound and it helped me from the first. It is the only medicine I took that did help me and I recommend it. You don't know how thankful and grateful I am. I give you permission to publish what your good medicine has done for me."—Mrs. SIMON DOUCETTE, Belleville, Yarmouth Co., Nova Scotia, Canada.

Such warning symptoms as sense of suffocation, hot flashes, headaches, backaches, dread of impending evil, timidity, sounds in the ears, palpitation of the heart, sparks before the eyes, irregularities, constipation, variable appetite, weakness and inquietude, and dizziness, are promptly heeded by intelligent women who are approaching the period in life when woman's great change may be expected.

Lydia E. Pinkham's Vegetable Compound invigorates and strengthens the female organism and builds up the weakened nervous system. It has carried many women safely through this crisis.

If you want special advice write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass. Your letter will be opened, read and answered by a woman, and held in strict confidence.

A Clean Collar in A Minute

For The Man Who Works

CHALLENGE BRAND WATERPROOF COLLARS

Appearances count a lot, these days, especially for the working man.

"Challenge" Collars give the clean, dressy appearance of linen — in fact, they look exactly like linen.

But—here's the point—

No matter how soiled and grimy they get, you can clean them in a minute with soap and water—and look neat and tidy all day. Sold at all Men's Furnishing and Dry Goods Stores—or send 25c. for sample collar. 5

Absolutely the best Waterproof Collar Made.

porting that his knowledge and his ignorance were all one to her, "and I have brought him here, to put him to a school where he may be thoroughly well taught, and well treated. Now tell me where that school is, and what it is, and all about it."

"Before I can advise you properly," said Mr. Wickfield,—"the old question, you know. What's your motive in this?"

"Deuce take the man!" exclaimed my aunt. "Always fishing for motives, when they're on the surface! Why, to make the child happy and useful."

"It must be a mixed motive I think," said Mr. Wickfield, shaking his head and smiling incredulously.

"A mixed fiddlestick!" returned my aunt. "You claim to have one plain motive in all you do yourself. You don't suppose, I hope, that you are the only plain dealer in the world?"

"Ay, but I have only one motive in life, Miss Trotwood," he rejoined, smiling. "Other people have dozens, scores, hundreds. I have only one. There's the difference. However, that's beside the question. The best school? Whatever the motive, you want the best?"

My aunt nodded assent.

"At the best we have," said Mr. Wickfield, considering, "your nephew couldn't board just now."

"But he could board somewhere else, I suppose?" suggested my aunt.

Mr. Wickfield thought I could. After a little discussion, he proposed to might see it and judge for herself; also to take her, with the same object, to two or three housec where he thought I could be boarded. My aunt embracing the proposal, we were all going out together, when he stopped and said:

"Our little friend here might have some motive, perhaps, for objecting to the arrangements. I think we had better leave him behind?"

My aunt seemed disposed to discuss the point; but to facilitate matters I said I would gladly remain behind, if they pleased; and returned into Mr. Wickfield's office, where I sat down again, in the chair I had first occupied, to await their return.

It so happened that this chair was near a narrow passage, which ended in the little circular room where I had seen Uriah Heep's pale face looking out of the window. Uriah, having taken the pony to a neighboring stable, was at work at a desk in this room, which had a brass frame on the top to hang papers upon, and on which the writing he was making a copy of was then hanging. Though his face was towards me, I thought, for some time, the writing being between us, that he could not see me; but looking that way more attentively, it made me uncomfortably to observe that, every now and then, his sleepless eyes would come below the writing, like two red suns, and stealthily stare at me for I dare say a whole minute at a time, during which his pen went, or pretended to go, as cleverly as ever. I made several attempts to get out of their way—such as standing on a chair to look at a map on the other side of the room, and poring over the columns of a Kentish newspaper—but they always attracted me back again; and whenever I looked towards those two red suns, I was sure to find them, either just rising or just setting.

At length, much to my relief, my aunt and Mr. Wickfield came back, after a pretty long absence. They were not so successful as I could have wished; for though the advantages of the school was undeniable, my aunt had not approved to any of the boarding-houses proposed for me.

"It's very unfortunate," said my aunt. "I don't know what to do, Trot."

"It does happen unfortunately,"

PEERLESS PERFECTION

It's made right—from high grade material. In the construction of our PEERLESS FENCING we use open hearth steel wire. By this process impurities are removed from the metal, thus eliminating one of the chief causes for the rapid rusting of fence wire. PEERLESS is guaranteed to give you satisfaction. Send for catalog. Agencies nearly everywhere. Agents wanted in open territory.

Financial Report of the Halifax Exhibition.

(Continued on page 115.)

praise from visitors, one American visitor expressing himself, "that it was the best exhibit he had ever seen, with but one exception, which is kept up permanently by the State in which it is located."

Now we arrive at two departments which receive the criticism.

The Fisheries Department was, perhaps, no worse than the last, or some former years, but was not an exhibit worthy of a fish Province, but the question arises, what can be done with it? Not an exhibit, with perhaps one exception, from a bona fide fisherman, notwithstanding good prizes are offered. For some years, our former superintendent, Mr. S. Y. Wilson, gave a great deal of his valuable time to this department, but was never repaid in the smallest degree for the thorough canvass he made along the shores. Whether it is advisable to cut out the prizes in this department and use the money for procuring an exhibit is a matter which should have consideration.

MANUFACTURERS' DEPT.

Nova Scotia is not alone in its trouble in getting a satisfactory exhibit in this department.

Reading the reports of different Fair Managers at Vancouver, Calgary, Regina, Ottawa, as well as our own Province, we find they have the same difficulty as we have here.

That perhaps our building does not look up to the standard is greatly due to two reasons, i. e. The gallery was vacant owing to the schools not making their exhibit, and which is not only attractive but covers a large area of the gallery which is not suitable for anything else.

Again, two large booths which have been occupying corners were removed but the average visitor would say that the exhibits which occupied these spaces this year were valuable ones and the change was fully justified.

In the Annex, while the whole of the space in the North end was applied for by automobile people, a great many were short in their intended exhibit which naturally gave the appearance of an unfilled building. Notwithstanding this the exhibit on the whole was a creditable one, some of the exhibits being very attractive and valuable.

Summing it all up from an exhibition standpoint we do not believe the term applied was justified.

Leaving the exhibition proper to go to the amusement end of the fair. Not having read of criticisms of this department, it will only be necessary to give it a passing notice, and say, that the programme before the grand stand was on the whole, the best we have ever had.

THE EXPENDITURES.

The cost of the different departments vary very slightly from former years. The amount paid in prizes is about $550 larger than last year, due to the extra money offered in the various live stock classes, which was justified, and went to the Provinces as follows:

Nova Scotia	$7,522.25
New Brunswick	669.50
Prince Edward Island	1, 432.25

Our total receipts are nearly $900 over last year, due entirely to admissions, and privileges, the receipts at the gate and grand stand being nearly 1100 more than last year, while our receipts for privileges were more than $400 larger. The receipts at the grand stand notwithstanding all the bad weather which we had in the second week, when the stand was closed on one afternoon and two evenings, paid for the whole of the attractions and speed prizes, less $86.-20. If we figure the first gate receipts from the number who patronized the stand we would have a surplus of $6,-293.45 to go to the exhibition proper.

FINANCIAL STATEMENT.

By the attached financial statement you will notice that the expenditure of the exhibition over and above receipts is $10,139.26, which should not appear as a deficit.

Putting the exhibition on the same basis as all other Provincial as well as County fairs, instead of a deficit we have a surplus of $773.64, as the amount we have paid as interest, which we would not have to pay were our grants paid in advance, would give us the amount named above as a surplus.

P. E. I. November Crop Report.

HAY.—The final returns from the hay crop were reported on September 10th., showing a better than average crop saved in excellent condition.

OATS.—The oat crop is better than average but not equal to that of last year. The damage from weather was much severer than in the case of wheat. Again the loss is heaviest in Prince County. From 15 to 20 p.c. of the whole crop is unfit for seed on account of the weather conditions and is probably injured in its feed value. There has also been a small amount totally lost.

BARLEY.—The crop of barley is not up to the average. The wet weather affected its growth more than that of the wheat or oats, probably because it was sown in the lower lying grounds. It was not injured by the rains to the same extent as the oats. A much larger percentage of it was out in the rains but practically all of it will make first class feed, and there is some seed saved in excellent condition.

CORN.—The corn crop was a failure this year. The season was very cold for it, and same sections it was injured by a frost early in September. It is not reported as being a full crop in any district.

POTATOES.—The potato crop is considerably below the average and is very patchy, Last year the crop in King's County was fully 50 p.c. above average. This year the crop is about 68 p. c.; Queen's 96, and in Prince 105 p.c., average about a 90 p. c. crop all round. The damage to potato crop has been very great. About half of the correspondents of King's County report potato vines being injured frost in September with the result that the tubers are small. In some sections too they are rotting Queen's and Prince Counties, particularly in the latter, many of the potatoes were in the ground through the very heavy rains of October and were caught by a frost on the first day of November. So between frosts and rot not more than an 80 p.c. crop has been harvested.

ROOTS.—The root crop is below average. The rain has had a bad effect on them and they have been more subject to injury by insects and fungus diseases than usual.

APPLES.—The apple crop in general is light and is not of good quality. Scab is very prevalent and a lot of the fruit did not color well and is smaller than usual. The early apples were about a 76 p.c. crop; the Fall ter apples about a 65 p.c. crop and Winter apples about 60 p.c.

WHEAT.—The wheat crop is much better than average but a great deal of it was lost in the harvesting. About 5 p.c. of the total crop was injured by the heavy rains and is unfit for milling purposes. More than half this injured wheat is in Prince County.

LIVE STOCK.—Live Stock of all kinds are in better condition than usual due probably to the pastures which have been good all the Autumn. There is a scarcity of Pure Bred Rams and Boars, and a large inquiry for Pure Bred Short Horn Bulls, particularly of the milking strain.

The poultry industry is making a great advance. There never was so many eggs offering for sale at this time of year, and the prices were much better than were ever before paid in this province. Dressed poultry too is somewhat scarce and is bringing very high prices. The raising of turkeys and geese is becoming more general on account of the high prices of past years, and their is considerable increase in numbers this year over last year.

REGARDING SUPPLY OF SEED FOR NEXT SPRING:—There will be no scarcity of good seed, both of oats and potatoes for next year, but it looks as if the price of both of these would be much higher than is at the present being paid, and parties having good, bright grain, true to name, would do well to reclean it for the seed market.

A SURE CURE FOR WOMEN'S DISORDERS
Ten Days' Treatment Free

ORANGE LILY is a certain cure for all disorders of women. It is applied locally and is absorbed into the suffering tissue. The dead waste matter in the congested region is expelled, giving immediate mental and physical relief; the blood vessels and nerves are toned and strengthened, and the circulation is rendered normal as this treatment is based on strictly scientific principles, and acts on the actual location of the disease it cannot help but effect a cure of all forms of female troubles, including delayed and painful menstruation, leucorrhoea, falling of the womb, etc. Price, $1.00 per box, which is sufficient for one month's treatment. A Free Trial Treatment, enough for 10 days, worth 35c. will be sent Free to any suffering woman who will send me her address. Enclose 3 stamps and address, MRS. FRANCES E. CURRAH, Windsor, Ont.

For Sale by Leading Druggists Everywhere.

I DOUBLED MY CROPS

This story could be told by many Canadian farmers who have used a high grade POTASH fertillzer.

One farmer in Cape Breton, N. S., doubled his crop of potatoes, in fact has just harvested a yield of 735 bushels to the acre. If he can get such a yield, why can't you?

You surely ought to have plenty of barnyard manure to use. If so, use it in **quantities** in connection with 400 lbs. Basic Slag and 16) lbs. Sulphate of Potash to the acre; cultivate well and you can get a yield similar to his. This is what he did.

Another farmer in Cowansville, Que., obtained a yield of 1,666 bushels of mangels to the acre by using 150 lbs. Nitrate of Soda, 400 lbs Acid Phosphate and 150 lbs Muirate of POTASH, increasing his yield 826 bushels over the plot fertilized with only Acid Phosphate and Nitrate of Soda.

It cost this Farmer just $3.45 to get 826 Bushels more of Mangels.

If **you** want to do likewise on **your** farm, write us and we will tell you how

POTASH PAYS

Every crop removes from the soil so much Nitrogen, Phosphoric Acid and POTASH. This is the food the plant consumes. If you wish to raise bigger crops, you must put back into the soil the plant food that the plant takes up in its natural growth.

You probably understand this, and very likely you use some sort of fertilizer, but if you are NOT using a fertilizer containing 6 p. c. to 10 p. c. of POTASH, you cannot get bigger yields of better quality. This is because a plant removes from the soil more POTASH than Phosphoric Acid.

Ordinarily, low grade fertilizers contain from 6 p. c. to 8 p. c. Phosphoric Acid and approximately 2 p. c. of POTASH. Certainly this is not more POTASH than Phosphoric Acid. You must increase this percentage to 6 p. c. to 10 p. c. POTASH. If you want to raise a bumper crop next year do this.

Insist that your dealer supply you with a 6 p. c. to 10 p. c. POTASH fertilizer. If he cannot do this, and you have to buy a low grade fertilizer, for every ton of low grade fertilizer you buy, add 200 to 300 lbs. Muriate or Sulphate of Potash and this will bring it up to a high grade fertilizer.

You can mix your own fertilizer at home if you want to. Our Agricultural Experts will tell you FREE how to do this. Get in touch with your fertilizer dealer NOW, so that he will be sure to have POTASH on hand for you when you need it. Send us your dealer's name and we will send you FREE booklets on how to increase your yield. These booklets we know are instructive and are the best on the subject, being written by Experts. Write us telling the kind of crops, you raise, giving us the name of your dealer, and we will see that you get a fertilizer high in POTASH.

You will have plenty of time this winter to study this all-important question, and how to proceed another year to get bigger yields of better quality from your farm. Write us today.

German Kali Works, Inc.

TEMPLE BUILDING, - - TORONTO,

Having Muriate and Sulphate of POTASH in Store at St. John, N. B.; Montreal and Toronto makes it easy for you to get your POTASH from us.

Watch Your Liver.

If It Is Lazy, Slow or Torpid Stir It Up By the Use of Milburn's Laxa-Liver Pills.

A lazy, slow or torpid liver is a terrible affliction, as it holds back the bile, which is required to move the bowels, and lets it into the blood instead, thus causing Constipation, Catarrh of the Stomach, Sick Headache, Langour, Pain under the Right Shoulder, etc.

Mrs. Wesley Estabrooks, Midgic Station, N.B., writes:—"For several years I had been troubled with pains in the liver. I have had medicine from several doctors, but was only relieved for a time by them. I then tried Milburn's Laxa-Liver Pills, and I have had no trouble with my liver since. I can honestly recommend them to every person who has liver trouble."

Milburn's Laxa-Liver Pills are 25c a vial, or 5 vials for $1.00, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

PILES CURED at HOME by New Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write to-day to Mrs. M. Summers, Box P. 309, Windsor, Ont.

Women's Institute in Nova Scotia.

The Department of Agriculture of Nova Scotia keenly alive to the best interests of Nova Scotia, introduced into the Province this year a new movement along rather different lines from any work undertaken in the past. This work was the establishing of Women's Institutes; an organization inaugurated some fifteen years ago in Ontario as an offshoot of the Farmer' Agricultural Societies, for the purpose of imparting to the women of Ontario information more closely related to home life and women's work. Intended originally for the farmers' wives and daughters, the organization has gradually enlarged until it includes as its members women in every walk of life, who have at heart the welfare of home and community.

From Ontario the movement spread into other provinces and wherever an Institute has been established the enthusiasm has grown and the good accomplished, not only along practical lines but also tending towards greater sociability in rural districts has been almost uncalcuable. While the organization has been meeting with success in other places, it has never been found possible or expedient to establish it in Nova Scotia. This past summer, however, the Department of Agriculture, being in a position to establish the work on a firm basis, arranged for a series of meetings to be held in Pictou, Colchester and Cumberland Counties during July. The result of these meetings was so encouraging that the Department determined to push the work as rapidly as possible to arrange another series of meetings, this time in the Counties of Hants, Kings and Annapolis.

Miss Susie Campbell, of Toronto, Ont., who has been successfully connected with Institute work in that Province for several years, was associated with Miss Jennie W. Fraser in this work. Three districts in Hants, four in Kings and three in Annapolis were visited, meetings were held and many personal calls made. While this campaign did not meet with the complete success that crowned the first journey, still it was felt that good work had been accomplished. The fact that the women of some districts who felt that their time was already overtaxed and could not see the way clear to take up Institute work, requested the Department to visit them on the return trip, was sufficient guarantee that they had seen the necessity and importance of the work. Out of the ten places visited, six were ready to establish and maintain an Institute and the interest and enthusiasm displayed when the object was fully understood, was most encouraging.

To enable the members of the Institutes already formed to discuss the future development of the work, a Convention will be held from January 13th to 15th at the Agricultural College, Truro, during the Winter Short Course. Lecture and demonstrations will be given along the line of home and outside work.

The following is a list of the Institutes formed throughout the Counties already visited:

Scotch Village, Hants Co., Membership, 16, Pres., Mrs. Frail; Vice-Pres., Mrs. Alfred Cochran; Sec.-Treas., Miss Florence Walley.

Martock and Windsor Forks, Hants Co., Membership 18, Pres., Mrs. Levi Daniels; Vice—Pres., Mrs. Saunders; Sec.—Treas., Miss Queenie Palmer.

Grand Pre, Kings Co., Membership 9, Pres., Mrs. Bowser; Vice-Pres., Mrs. Crane; Sec.-Treas., Mrs. Guy Fuller.

Port Williams, Kings Co., Membership 18, Pres., Mrs. (Rev.) J. D.

NEW COAL OIL LIGHT BEATS ELECTRIC OR GASOLINE

10 Days FREE—Send No Money

We don't ask you to pay us a cent until you have used this wonderful modern light in your own home for ten days, then you may return it at our expense if not perfectly satisfied. We want you to prove for yourself that it gives five to fifteen times as much light as the ordinary oil lamp; beats electric, gasoline or acetylene. Lights and is put out just like the old oil lamp;

BURNS 70 HOURS ON 1 GALLON OIL

Gives a powerful white light, burns common coal oil (kerosene), no odor, smoke or noise, simple, clean, won't explode. Guaranteed.

$1000.00 Reward

will be given to the person who shows us an oil lamp equal to this **Aladdin** in every way (details of offer given in our circular). Would we dare make such a challenge to the world if there was the slightest doubt as to the merits of the **Aladdin?** We want **one person in each locality** to whom we can refer customers. Write quick for our 10 Day Absolutely Free Trial Proposition, Agents' Wholesale Prices, and learn how to get **ONE FREE.**

AGENTS WANTED

to demonstrate in territory where oil lamps are in use. Experience unnecessary. Many agents average five sales a day and make $300.00 per month. One farmer cleared over $800.00 in 6 weeks. You can make money evenings and spare time. Write quick for territory and sample.

MANTLE LAMP CO. 282 Aladdin Bldg., Montreal & Winnepeg

Something New for Men

Restore Your Own Strength--No Drugs

Manly Men Fascinate the Whole World

The free illustrated pocket compendium of private advice for all men, whether young or elderly, single or married, whether well or ailing (explained below), not only contains a great fund of necessary information upon certain avoided private subjects, telling you what to avoid, what to do and what not to do, but also fully describes a new small mechanical appliance called a VITALIZER which generates a natural force and which is now being worn by men all over the world who seek new manly vigor. You, yourself, no matter where you live, may easily have one of these little VITALIZERS to try out in your own case. Therefore, please use the coupon below and get this free pocket compendium by return mail. SANDEN. AUTHOR.

How would YOU, reader, like to be strong, vigorous, vital and manly once more, without an ache, pain or weakness? If you really seek and want this new vigor, this rugged manly strength, then please call at my office or write today and get my free book that you may know the whole wonderful story of this great, drugless, self-treatment, this marvellous little VITALIZER of my invention, which you wear comfortably on your body, and which sends its steady gentle, silent supply of FORCE into your nerves, blood and organism while you sleep.

Real manhood with a perfect manly strength is not only nature's own gift, but, according to my belief, may easily be within the reach of practically any man. Of course, we all know that it is the husky, vigorous, vital fellow who attracts both women and men to him, and it is he, also, who is ever sought out and who achieves the really big things of life. Sturdy, vital manhood is, without doubt, the one great, silent universal power which fascinates us all, no matter how we may argue to the contrary. Therefore, reader, I care not what may be your age, nationality or creed, whether you are married or single, whether you are a bank president or work on the farm or in the shop, nor do I care how unstrung or nervous you may feel, or what past acts may have left you debilitated and enervated, I say to you in all seriousness, if I can show you an easy, drugless way by which you may treat yourself with the object of bringing back full vigor to your organism, then I will show you the road to new hope and new manhood. A man may be small in stature, yet as strong and attractive as a giant, or he may be big in stature, yet unstrung, nervous and unmanly. It is all a question of your own vigorous strength. Therefore, let me suggest that you call or write at once, then, after reading my book, if you decide you want to try out my little vitalizer in your own case, and will write to me sayingso, I will reply to your letter and guarantee to make an easy proposition which should enable you to have one of the vitalizers at once. At all events, you need the knowledge that my little book contains, whether you ever get a vitalizer or not, so please call or fill in and send the coupon.

NOTE—With special attachments my VITALIZER is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, nervousness and general ill health

Free Self-Help Book For Men

I publish a little illustrated pocket compendium in booklet form, as mentioned above, which is meant to guide both single and married men along the road of Vigorous Health and Moral Rectitude, so they may be as vigorous and strong as the best, and may live to a ripe, healthy old age. There is a lot in this little compendium which every young or elderly man should know and can refer to from time to time with great profit to his own physical health. The booklet in one part fully describes my new VITALIZER, the great drugless self-treatment. If it is not convenient or if you are too far away to call, please write for this booklet today. It will come to you in plain, sealed envelope by return mail. Please use coupon. Office hours, 9 to 6.

Dr. M. F. SANDEN, CO.,
140 Yonge St., Toronto; Ont.

Dear Sirs—Please forward me your book, as advertised, free, sealed.

Leaving the Farm.

With hopeful fears they packed their goods,
The farmer and his faithful wife,
Their thoughts returned to'rd the city great,
With all its tumult and its strife.
"The city is the place," he said,
"For country folk to take their ease;
Where all is gayety and joy,
And everything is made to please.
"Where we, with years and labor worn,
May dwell in tranquil happiness."
His patient helpmeet only smiled,
And went on folding coat and dress.
As from the farm they slowly drove,
To take the speeding railway train,
The robins piped a mournful lay,
As if to call them back again.
The cherry blossoms softly fell,
Like white down from an angel's wing;
The horses whinnied in the field;
The cattle drowsed around the spring;
And e'en the gentle springtime breeze
Seemed whispering a sad farewell;
The good wife heaved a parting sigh,
While down her cheek a teardrop fell.
The city, to the rustic pair,
As through its busy streets they'd roam,
Brought disappointment day by day,
'Twas so unlike their country home.
The evening brought no peaceful calm,
And filled with clamor were the days;
Unused to aught but rural scenes,
They felt like lonely castaways.
The crowded town oppressed them sore,
They could not find its fancied charm;
All day they thought of trees and fields;
At night they dreamed about the farm.
With weariness their hearts grew numb,
As sadness timed the rhythmic beats;
A lonelier place they ne'er had found
Than those congested city streets.
Again they quickly packed their things,
This time with buoyant, happy hearts;
Back to the country they would go,
Far from the city's crowded marts!
And as they neared their loved abode,
And passed each field and copse and glen,
The wife breathed softly, "Here is rest!"
The husband cried, "Home, home again!"

"It is a pleasure to tell you that Chamberlain's Cough Remedy is the best cough medicine I have ever used," writes Mrs. Hugh Campbell, of Lavonia, Ga. "I have used it with all my children and the results have been highly satisfactory." For sale by all dealers.

What Well-Known English Proverb Does This Picture Represent?

PROVERB PICTURE No. 1

FREE $2,000.00 IN PRIZES

In the Continental Publishing Company's Great Proverb Contest.

A Genuine Test of Skill and Diligence.

2nd Prize

A magnificent mahogany machine of the newest model.

Can You Guess the Answer to the Above Picture?

The picture shown above represents a well-known standard English proverb, a saying that you hear almost every day. Study it carefully, and when you think you have found the proverb it represents, write it out on a sheet of paper, with your name and address and promptly mail it to us.

How to Enter This Great Contest

We have compiled a series of twelve proverb pictures, each one representing a well-known, standard English proverb. Only the first of this series of proverb pictures will be published in this paper. The complete set of pictures will be sent to you right away when you guess the answer to picture No. 1 correctly.

You obtain entry to this Great Contest by finding the proverb represented by picture No. 1. This starts you on the road to sharing in the stupendous distribution of prizes given in the list below. If the answer you send in is correct, we will write and tell you so and send you

FREE a Fine Book of Standard English Proverbs and the Series of Twelve (12) Proverb Pictures, Completing the Contest

The publishers of Canada's greatest monthly magazine are conducting this great contest. Therefore contestants are assured of its absolute fairness and squareness. In order to give an equal chance to every competitor they have published a fine book of standard English Proverbs and all the proverbs represented by the series of twelve pictures have been chosen from this book. Answer proverb No. 1 correctly and this fine book will be mailed to you free. With it you will receive the complete series of twelve proverb pictures which complete the contest. Thus, there will be no waiting or delay. All the pictures will be presented to you at once and you can set to work to find the answers that can win you your share of these wonderful prizes.

The senders of the winning answers, chosen by the Judging Committee in accordance with the conditions of the contest (see simple rules given below) will be awarded the following stupendous

LIST OF PRIZES

This Contest is Absolutely Free. You are not asked to spend a cent of your money or buy anything in order to enter

This stupendous Contest is being conducted by the Publishers of "Everywoman's World," solely with the object of introducing Canada's greatest home journal into new homes and to new readers. In addition to the fine standard book of English Proverbs, and the series of proverb pictures, each contestant will receive a free copy of the current number of **EVERYWOMAN'S WORLD.** This is sent to you without charge because the publishers know that once this magnificent journal is introduced into the homes of the intelligent people who will enter this great contest it will be wanted every month. There is no other monthly magazine published in Canada like "Everywoman's World," and you will be delighted to have the people in your home become acquainted with a magazine so live, bright and entertaining.

Read Carefully the Simple Rules Governing Entry to the Contest.

1.—Write on one side of the paper only, your solution to proverb picture No. 1, and give your full name (stating Mr., Mrs., or Miss) and complete address. Anything else but your answer to picture No. 1 and your name and address should be written on a separate sheet of paper and should be confined to fifty (50) words.

2.—Members and employees of this firm, or relations of members or employees are absolutely excluded from competing.

3.—**Enclose with your answer two (2) two-cent stamps (4 cents).** This is to help defray postage on the Book of English Proverbs, complete series of pictures, illustrated prize list, etc., which we will mail to you.

4.—Contestants may send any number of solutions to the complete series of pictures but only one set of answers can win a prize.

5.—Different members of a family may compete, but only one prize will be awarded to any one family or household.

6.—All letters must be fully prepaid in postage. We will refuse to accept answers on which we have to pay postage.

7.—The Judging Committee will consist of five (5) prominent Toronto business men whose names will be published in due course. Prizes will be awarded to correct or nearest correct answers in accordance with handwriting and general neatness and contestants must agree to abide by the decision of the judges.

8.—Contestants will be asked to show the copy of Everywoman's World, which we will send, to three friends or neighbors who will want to subscribe.

9.—As soon as your answer is received and found correct we will write advising you and send you the complete series of proverb pictures and the Book of Famous English Proverbs, together with **a copy of the current number of "Everywoman's World."** Address your letters plainly to **Contest Manager.**

CONTINENTAL PUBLISHING CO., Limited, Dept. 22, TORONTO, CANADA.

Consult the Farmer when you want to buy anything for the Farm or Dairy. . . . . .

PIMPLES
Are an "EYE SORE."

Pimples are caused by the blood being out of order. Those little festering sores appear on the forehead, on the nose, on the chin and other parts of the body, and although they are not a dangerous trouble they are very unsightly to both you and your friends.

There is only one way to get rid of them, and that is to purify the blood.

Burdock Blood Bitters is without a doubt the best remedy on the market for this purpose.

Wm. F. Donohue, Jr., Hamilton, Ont., writes:—"About six months ago my little son's face was literally covered with pimples. I tried every preparation I was told of by my friends, but to no avail. Soon I thought I could not have them fixed up, and would have to wait, and let him grow out of them, but thanks to Burdock Blood Bitters they are all gone, and I gladly recommend it to anyone."

Burdock Blood Bitters is manufactured solely by The T. Milburn Co., Limited, Toronto, Ont.

FLORICULTURE.

Amadie writes:—Please tell me how to keep an Azalia plant in the house. It has been in the garden all summer but now it seems to be dropping its leaves and the stem is getting covered with a fine green moss. The leaves turn brown on the under side, and then fall off.

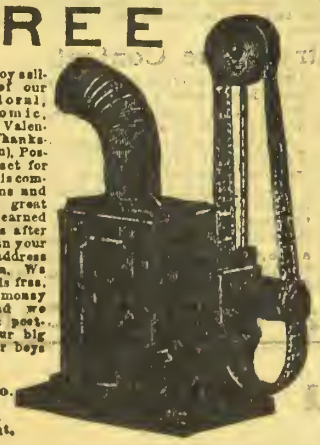
Wash the Azalia leaves with kerosene emulsion or whale oil soap. An hour or so after this application, spray thoroughly with cleab water. Azalias are better for a sprinkling of the foliage occasionally all winter.

I do not understand about the moss spoken of. Would think that a simple rubbing of the trunk with a coarse brush would remove this trouble. Never allow an Azalia to become dry and always see that the drainage is perfect, as stagnant water at the base of an Azalia is almost sure death to it. Spraying buds with clear water will also hasten their development.

To anyone who has delayed the planting of out-door bulbs until the last minute I would say be sure that you give the bed a generous coating of strawy manure at once. If the bed is in an exposed place where the snow is liable to blow off, get a few small spruce trees, sharpen the butts of the trunks and stick them down about it, these will cause drifts to form during the storms that will follow and help protect the bulbs in early spring.

Moving Picture Machine

FREE



To the girl or boy selling 40 sets of our Birthday, Floral, Scenic, Comic, (Christmas, Valentine, Easter, Thanksgiving in season), Postal Cards (6 in set for 10c). Machine is complete with films and slides, shows great pictures, can be earned in a few hours after school. Send in your name and address plainly written. We will send cards free. Return us money when sold, and we send premium post-paid. Get our big premium list for boys and girls.

Sandcrack.

Sandcrack, is a division, split, crack, or fissure, in the wall of the foot. In the fore-foot it generally appears at the inside quarter, and at the toe, or in the front of, the hind feet. According to position the separation is called a toe or quarter crack. In most cases, it is due to brittleness of the crust, and while this may occasionally be constitutional, it is invariably the direct result of rasping the wall, and especially when this is practised above the clenches to the top of the hoof. Sandcrack may also be due to contraction, which in its turn may be due to natural causes, but is certain to be aggraved, if not caused, by the pernicious practice of carving away the bars, and so-called "opening" of the heels. When found in low, flat feet, sandcrack seems to arise from want of tone in the secretions of the crust and to want of quality in the horn. For the most part prevention lies in refraining from rasping the crust, and thus avoiding the grand cause of weakness and brittleness as detailed above. But what most querists want is a "cure," and they ask for it in a way that suggests that they expect to find in some "receipt," or mixture of drugs, a means of healing or re-uniting the divided edges of the split horn; indeed, "something to heal the crack," has more than once been asked for. This is quite impossible. There are various ways of dealing with sandcrack, but the fundamental principles are the same in all. These are the approximation of the divided edges, the limiting of motion, the removal of all bearing or weight off the part of the crust affected by the split and the speedy production of new sound horn from the coronet. The best method of proceeding depends somewhat on the extent of the fissure, and the existence or otherwise of lameness. In the ordinary way sandcrack does not cause lameness until it has become sufficiently deep to expose the sensitive laminae, or until it has extended right up into the coronary band. Lameness then arises either from the insertion of dirt or sand—which possibly accounts for the name—or from granulations from the exposed sensitive laminae becoming pinched between the divided edges of the horn as the foot expands and contracts as weight is imposed or removed when the foot is lifted or placed on the ground.

If there is lameness, the shoe should be removed, and local pain reduced by poultices or fomentation, and any systemic disturbance by a dose of physic, or the administration of febrifuges. In almost all cases of foot lameness a dose of aloes seems to act like a charm. Small cracks that do not cause lameness are sometimes dealt with by firing a V in the hoof so as to leave the top of the crack in the centre of the V. The concussion of the foot is thereby diverted from the injured part of the coronet, and gives the nearest approach to rest obtainable under the circumstances. Another plan of limiting motion, preventing extension of the fissure, and keeping out foreign matter, is to wind narrow tape dipped in tar, or strong waxed cord round the hoof, filling the split with gutta-percha, heel-ball, of cobbler's wax. It may be well to mention here that this method of filling is sometimes employed to hide this serious defect in horses offered for sale. When either of these substances is put in neatly with a warm iron, and the hoof nicely blacked over, a sandcrack may easily escape the eye of the unwary. Well blacked hoof should be closely scrutinised by an intending purchaser buying from a stranger or without warranty.

Various clamps have also been devised for the purpose of drawing the edges of the crack together and retaining them in opposition, the approximation being attained in some cases by forceps, in others by a screw arrangement forming part of the clamp. These mechanical contrivances are sold by veterinary instrument makers. Cheaper, and quite as efficient, or even more so, is rivet the crack with horse nails. This operation requires considerable skill in setting the point of the nail and driving it. The nail is driven through the hoof on each side of the crack, the head partly rasped down, and the point then drawn up and clinched as in putting on the shoe. From one to three nails are necessary, according to the length and position of the fissure. Sometimes a bar shoe is employed with a view to limiting motion, but all feet are not capable of work. Then the only remedy is the French operation of stripping the hoof in the neighborhood and resting until a new foot is grown. In a case that came under my own observation the animal was a valuable hunter and the cracks reappeared after being apparently cured. In this case the operation was a success, or at least the foot continued sound until the horse was lost sight of. All these plans of treatment should be accompanied by some stimulation of the coronet to produce a rapid growth of strong, new horn, for, as I have shown, the crack will never re-unite.

The means to be adopted will vary with the severity of the case, and whether a stoppage of the work is necessary. If the animal is capable of work, repeated mild stimulation with an ointment made by mixing one part of biniodide of mercury with twelve parts of lard will be suitable. Of course, a sufficient interval must elapse between the applications to avoid making the part unbearably sore. If resting, a more active blister may be used, and one dracham each of biniodide of mercury and powdered cantharides, with oz. of lard or lanolin, will be suitable. When the soreness has passed away the foot may be swabbed, or the animal turned out in a level damp pasture, with a tip on to protect the foot. In the case of a crack extending to the coronet, the animal should be kept off work until the new horn has grown down at least an inch and a half. It need hardly be said that the ruinous use of the rasp in shoeing must be sternly forbidden, and that horses subject to sandcrack or shelly feet should have them dressed daily with lanolin or other suitable material, free from alkalis or fatty acids, to prevent undue escape of moisture and the drying up that results from the removal of the natural varnish. There is one method of dealing with sandcrack that I had almost forgotten to mention, viz., clearing out the crack, and inserting a plug of wood. It is the invention of a prominent London veterinary surgeon, but is a plan of which I have no personal experience. —F.

He works 36 hours at a stretch

And overtime when needed. Anyone can afford him, for he only costs $3.00 to buy and nothing at all to keep. Nearly half of the families in Canada have taken advantage of this and have employed him to get the family up in the morning.

Even if you have a preference about waking up, he's ready to get you up your way. If you like to be wakened gradually, he'll ring little short rings every other half-minute for ten minutes. If you're a hard sleeper and need a strong dose, he'll sing out with a long, vigorous, full five-minute ring. Either way, you can shut him off at any point.

7,000 Canadian dealers are necessary to take care of the demand he's created for himself. He's made a world's Record as a success.

He's invaluable on the farm, because he not only helps you get the hands out on time, but serves as a first-class clock to tell the *day* time by.

He stands 7 inches tall, is triple nickel-plated—has a vest of good implement steel that keeps him hardy; large, bold figures and hands to tell the time by in the dim light of morning. He is as fit for the parlor as the bedroom.

If your dealer hasn't him, send a money order for $3.00 to *Westclox, La Salle, Ill.*, and he'll come anywhere in Canada by parcel post, duty charges paid.

He bears the imprint, *Made in La Salle, Illinois, by Westclox*, which is the best alarm clock insurance you can buy.

Concerning Potato Troubles.

(Continued from page 117.)

ed plots, 2 and 3, carrying a healthy dark green foliage, while on the unsprayed plots the tops showed marked signs of disease.

September 3rd.—On the unsprayed plot, No. 1, the foliage had fallen and the tops had nearly all died down. Plots 2 and 4, sprayed once, showed some signs of disease, but the tops on plot 3, sprayed twice, were still healthy and growing and continued so until lifting. The potatoes were raised on October 2nd, and carefully weighed, the results being shown below. All the figures are given per acre and in tons and hundred weights.

It will be seen by the results of this experiment that the effects of the spraying are two-fold; first, a large increase in the total yield, and second, a marked decrease in the proportion of diseased potatoes. The increased yield is accounted for by the much longer growing season ensured to the sprayed potatoes by the absense of disease in the topsf Early spraying in this experiment proved to be better than late spraying (compare plots 2 and 4), but the best results were obtained from spraying twice, the extra labor and expense involved being amply repaid in the resulting crop, this plot, No. 3, showing a return of over one ton per acre of saleable potatoes more than any other plot, together with the lowest proportion—less than 1 per cent—of diseased tubers.—W. H. Tompkins, in Farmers' Magazine.

If you have young children you have perhaps noticed that disorders of the stomach are their most common ailment. To correct this you will find Chamberlain's Stomach and Liver Tablets excellent. They are easy and pleasant to take, and mild and gentle in effect. For sale by all dealers.

MARKETS.

Charlottetown Market Report.

GRAIN.—Oats, White, 35c. to 36c., Black, 38c.

FEEDSTUFSS.—Bran, $26.00 to $27.00 per ton; Shorts, $1.50 per 100 lbs.; Middlings, $1.50 per 100 lbs.; Oil Cake, $2.00 per 100 lbs.; Cottonseed Meal, $1.80 per bag; Corn Meal, $2.00 per bag.

LIVE STOCK.—Butcher's Cattle, 4½c. to 5½c. per lb.; Stockers, $18.00 to $30.00; Milch Cows, $25.00 to $60.00; Sheep, 4½c. to 5½c. per lb.; Lambs 5c. to 6c. per lb.

DRESSED MEATS.—Beef (Carcass), 8c. to 11c. per lb.; Beef (Retail) 8c. to 16c.; Mutton (Retail), 8c. to 14c. per lb.; Pork (Carcass), 10c. to 11c. per lb.

HORSES.—Drafters, $150.00 to $250.00; Carriage, $150.00 to $250.00.

DAIRY PRODUCTS.—Creamery Butter, (Solid), 26c. per lb., (Prints), 27c.; Dairy Butter, 22c. to 26c. per lb. Cheese, 13½c. per lb.

POULTRY AND POULTRY PRODUCTS.—Eggs, 29c. to 30c. per doz.; Fowl, 10c. to 12c. per lb.; Chickens, 11c. to 14c. per lb.; Ducks, 12c. to 13½c. per lb.; Geese, 11c. to 13c. per lb.; Turkeys, 20c. to 21c. per lb.

FRUIT.—Apples, $2.00 to $4.50 per bbl.

MISCELLANEOUS.—Hay, $10.50 to $11.50 per ton; Straw, $6.50 to $7.50 per ton; Beef Hides, 13c. per lb.; Sheep Skins, 80c. to $1.10 each; Lamb Skins, $1.00 each.

VEGETABLES.—Carrots, 40c. to 45c.; Potatoes, 30c.; Turnips, 10c. to 11c.; Beets, 30c. to 35c.; Parsnips, $1.00 per 100 lbs.; Cabbage, 20c. per 100 lbs.

Trade has been quiet during the fall. The continued wet weather during October caused a lot of damage to grain and potatoes and caused so much delay in storing the craps that the farmers have had little time for shipping and the amount of farm produce exported is not nearly as good as if weather conditions had been normal. Prices have been fairly steady all fall. Oats is not as high as it was a year ago; but with this exception almost everything else is considerably higher. This is true more particularly in regard to eggs, pork and potatoes. The potatoes are reported not keeping well and we hear of heavy losses having been made by some shippers but think that the loss was caused largely by shipping immature early varieties. The White potatoes do not give satisfaction grown on our heavy soil with stable manure and if farmers intend growing these varieties we are of the opinion they should use commercial manures. Prices of all kinds of live stock have been fully maintained and lambs sold as high as 6 cents per pound live weight, which so far as we know is a record price for the province. A lot of oats was damaged by rain and large quantities will be unfit for sale and as these will have to be fed at home the demand for mill feeds will be smaller than usual. The quantity of hay exported this fall is much below the usual quantity as farmers did not have time to get it ready.

St. John Market Report.

GRAIN.—Wheat, $2.00 bus.; Oats, 50 c. to 52c. bus.; Peas, $2.40 bus.; Barley, $1.75 bus.; Buckwheat, 80c. to $1.00.

FEEDSTUFFS.—Bran, $25.00 ton; Shorts, $25.00 ton; Oil-Cake, $2.00 per 100 lbs.; Cottonseed Meal, $2.10 per 100 lbs.; Gluten Meal, $2.10 per 100 lbs.; Gluten Feed, $1.90 pet 100 lbs.; Corn Meal, $2.00 per bag.

GRASS SEEDS—Timothy, $4.00 per bus.; Com. Red Clover, 32c. lbs.; Mam. Red Clover, 35c. lb.

LIVE STOCK.—Butcher's Cattle, 4c. to 6c. lb. live weight; Stockers, $30.00 to $50.00 each; Milch Cows, $30.00 to $50.00 each; Sheep, $3.00 to $5.00 each; Lambs, $3.00 to $5.00; Hogs, 9c. to 11c. per lb.

DRESSED MEATS.—Beef (Carcass) 5c. to 11c. per lb.; Beef (Retail), 20c. to 25c. per lb.; Mutton, 15c. to 25c. per lb.; Veal, 8c. to 16c.; Pork, 18c. to 20c. per lb.

HORSES.—Drafters, $200.00 to $300.00 each; Roadsters, $150.00 to $252.00 each; Carriage, $200.00 each.

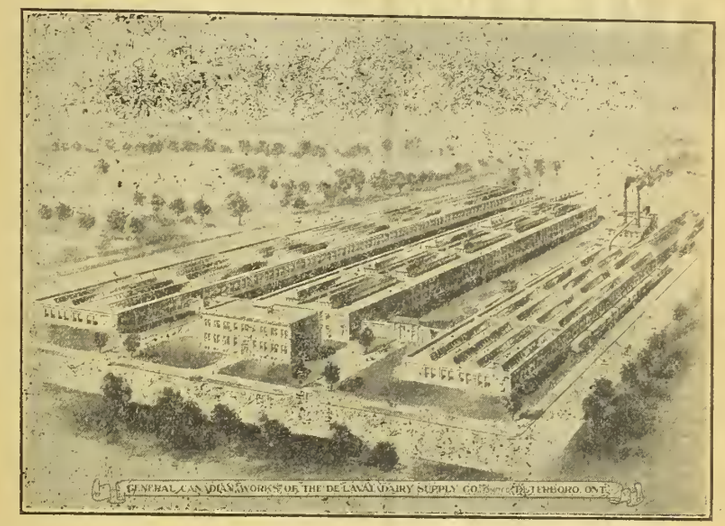
POULTRY AND POULTRY PRODUCTS.—Eggs, 30c. to 50c. per doz.; Fowl, 72c. to $1.50 per pair; Chickens 50c. to $1.50 per pair; Ducks, $1.50 to $1.75 per pair; Geese, $1.20 to $1.75 per pair; Turkeys, 28c. to 30c. per lb.

FRUIT.—Apples, $2.00 to $5.50 per bbl.; Cranberries, $5.00 to $6.00 per bbl.; Honey, $1.00 gal.; Maple Products, Sugar, 16c. to 18c. per lb.

MISCELLANEOUS.—Hay, $10.00 to $15.00 ton; Straw, $8.00 to $10.00 ton; Wool, 23c. to 25c. per lb.; Beef Hides, 12c. per lb.; Calf Skins, 18c. per lb.; Sheep Skins, 50c. to 70c. ea.; Lamb Skins, 40c. to 70c. each.

VEGETABLES.—Carrots, $1.50 per bbl.; Potatoes, $1.25 per bbl.; Turnips, 61c. to 80c. per bbl.; Beets, $1.50 per bbl.; Parsnips, $2.00 per bbl.; Cabbage, 40c. to 60c. doz.

New Home of De Laval Cream Separators and other Dairy Machinery at Peterboro, Ontario



Bird's-eye view of the New Factories and General Offices of the De Laval Dairy Supply Co., Ltd., at Peterboro, Ont.

In this Plant will be Manufactured De Laval Cream Separators, Ideal Green Feed Silos, "Alpha" Gas and Gasoline Engines and a Full Line of Creamery, Cheese Factory, Milk Dealer and Farm Supplies Machinery

Many of our readers who are users of De Laval Cream Separators, Ideal Green Feed Silos or any of the large line of dairy, creamery or farm supplies manufactured and distributed by the De Laval Dairy Supply Company, Limited, will no doubt be interested in the accompanying illustration of their new works which are being built at Peterboro, Ont.

This group of factory buildings, now rapidly nearing completion, is without doubt one of the finest plants of its kind in the country. The two wings on the right are already completed, all the machinery is installed and manufacturing has been carried on for several months. The office building which is shown in the foreground contains every modern convenience for the transaction of the company's business in the best possible manner and with the greatest dispatch and in this office is located the headquarters of the Company in the Dominion.

The construction of the buildingthroughout is of the most modern type of saw-tooth roof construction, affording maximum of light and ventilation; the materials used are concrete, brick and steel, and the buildings and equipment are designed with a view to turning out the highest grade of goods from both the standpoint of workmanship and material.

The group of factory buildings is situated in a plot of land covering fifteen acres which allows lots of room for future expansion.

Some idea of the magnitude of the plant will be conveyed by the fact that over a mile of private railroad tracks is required to serve this group of factory buildings.

In choosing the location for their new home the officers of the DeLaval Dairy Supply Company, Limited, were largely influenced by the convenience of transportation offered by the city of Peterboro, located as it is between Toronto and Ottawa, about seventy miles northeast of Toronto, on the lines of the Canadian Pacific and Grand Trunk Railways and the Trent Canal.

The De Laval Dairy Supply Company, Limited, in addition to its general office and factories in Peterboro, now have offices and warehouses in Montreal, Winnipeg and Vancouver, as well as warehouses for the convenient distribution of their goods at Calgary, Edmonton, Regina and Saskatoon.

The Company appreciate the wonderful possibilities for expansion of the dairy industry in the Dominion and accordingly have made provision for the increased requirements of our farmers for high grade dairy equipment, and they believe that the time is not far distant when Canada, instead of importing dairy products, will be seeking an outlet for them in foreign markets.

Bad Blood

is the direct and inevitable result of irregular or constipated bowels and clogged-up kidneys and skin. The undigested food and other waste matter which is allowed to accumulate poisons the blood and the whole system. Dr. Morse's Indian Root Pills act directly on the bowels, regulating them—on the kidneys, giving them ease and strength to properly filter the blood—and on the skin, opening up the pores. The Sow During Gestation.

When a sow has been impregnated by a visit to the boar, she may be kept under observation in order that it may be known that she stands. After a few weeks have elapsed nature will commence to make a serious demand upon her for the support of her as yet very small young. It is probable that few breeders of pigs realize that the growth of the foetus is provided for by the food consumed by the sow. Her blood is enriched and maintained by the aid of her rations, and whatever tends to diminish them, either in quantity or nutritious value not only deprives her, but also her pigs, of the sustenance they require. The first to suffer, however, is the sow, for she will maintain her pigs at the expense of her own body, hence good feeding is necessary during the whole period of gestation. This, however, does not mean that after service a sow should be made fat, for that process would be unwise. When a cow or a ewe is at grass while carrying young she eats all that she requires, while the food is not of the same character as that usually supplied to a sow confined to a stye. Thus a sow will consume in a few minutes as much feeding matter in meal as would take her as many hours to graze if she were tuzned out to pasture instead. If, however, a cow were chained up in a stall and supplied with all the hay, cake and meal that she will eat, she would do herself harm, and the remark applies equally to a ewe penned in a fold. Sows are in most cases kept and fed under artificial conditions, and it is for this reason that greater attention should be paid to them than is paid to the cow or the sheep. Where, however, a breeding sow is turned out daily to grass she requires little attention, she will cost less to feed, and what is equally good, she will maintain better health and breed better pigs.

The pig-keeper should follow the example of the cow-keeper. If three acres will keep the cow, one acre will suffice for the pig and some poultry as well. It does not appear to be recognized that a pig is a grazing animal, that success in breeding depends almost as much upon her having her liberty during at least eight months of the year as upon her blood, but such is the case. No rational man would expect to breed cattle successfully from cows which are constantly stalled, the thing is impossible; air, sunshine and exercise are as necessary to live stock as they are to man. When an animal is inactive much less oxygen passes through the system, oxidation is consequently slower, the muslular system ceases to exercise its normal powers, and permanent health and vigour are rapidly impaired. That sows will breed pigs although kept in confinement we are aware, but the results are unsatisfactory and can not compare with those which follow upon their regular exercise.

A GRASS PLOT FOR THE PIG.

The pig-keeper should regard a plot of land on which his pig may graze as important as the stye. Indeed, many farmers keep their sows at liberty and shut them in the fold yard at night, so that they are not confined to the stye at all, except when they have a litter of pigs, and even then exercise is good for the sow, although not for her young. Some of the best pig-keepers I have known provide grass plots for the pigs, but these should be large enough to provide plenty of grass, and also well fenced. Nothing is more annoying to a neighbor than to find a strange sow in his garden, his potatoes or his corn. The damage committed in a few minutes may take hours to repair, even if it can be repaired at all. A hedge, however thick, is not a very safe boundary, for most pigs will go through it in time. The best fence is made of posts and rails, the latter close together at the bottom, and fixed so firmly that the leverage exercised by a strong sow with her snout will be vain. A sow at liberty should be rung, otherwise the plot of grass intended to feed her will qu-ckly be turned up with the same powerful organ, although some pigs are much les troublesome in this respect than others. The cost of feeding a sow kept in the stye from the time of service until the day she litters varies in accordance with her size, but it may be reduced by the aid of a garden in summer or with the help of turnips and mangels in winter. If these foods are not available she may be fed on middlings, which will scarcely cost less than half-a-crown a week, and may cost something more. Barley and maize meal are not so well adapted to the purpose. Where, however, a sow can be turned out during the long days of summer to graze, and there is plenty of grass, they will practically earn their living although in such a case it is wise to give them a few handfuls of corn or pulse, which may be thrown on the grass. During winter the same course may be taken, but here the grass ration may be supplemented by the roots named, above, by carrots, parsnips, or cabbage, or chat potatoes. Where there is no grass plot there should still be room for exercise, even though it be only a yard. Many pig-keepers are glad of this advantage if it is much better than nothing

obtain forage in spring and summer, such as clover, vetches, lucerne, or sainfoin.—James Long, in Irish Farm and Home.

Sifting the Grain Feeds.

A grain-sieve is an accessory which should be found in every stable, for the purpose of sifting the oats and chaff before serving a grain feed, in order to rid them as far as possible of the dust they contain. There is a not inconsiderable amount of dust present even in well-cleaned oats, while chaff is generally still more dusty, and dusty provender is well known to have a detrimental effect upon a horse's wind. In fact, badly saved oats and hay, containing an excess of dust, may actually be the cause of horses going wrong in their wind; hence it is most desirable to sift the grain and chaff well before use. The dust seen in the forage is not the ordinary kind of dust, but consists of broken up debris from the outer husk covering the oat grains or from the stalks and leaves of the hay, which is produced as the result of fermentative acting set up after the grain or hay has been harvested. If garnered in a bad condition—that is, after suffering much exposure to rain during the harvesting process—oats and hay will contain an unusually large amount of dust, while an even worse degree of dustiness is caused if the oats or hay are mildewed or mouldy, owing to dampness. Apart from its usefulness for sifting the food, a grain-sieve is also about the most suitable kind of receptacle that can be used in which to carry the feeds of grain and chaff from the bin to the manger.

Lifting Up a Horse's Hind Leg.

The safest method of lifting up a horse's hind leg, supposing one is not sure that the animal is quiet to handle about the hind limbs, is the following:—Assuming it is the near leg it is wished to hold up, one should stand on the horse's near side, close to its body and about midway between the fore and hind leg, facing to-to it, the left man should then be placed on the quarter and gently run down the thigh till the ham string just above the hock joint is reached, this being very firmly gripped. By keeping a strong grip on the ham-string and pressing on it, the horse will be prevented from kicking with the leg, should it feel so inclined. Having thus obtained some control over the limb, we now bend down, grasp the front of the pastern in a back-handed manner with the right hand, and—while slightly relaxing the hold on the ham-string, but still keeping the left hand there—lift the foot off the ground. To keep the leg up it is best to rest it at the pastern joint upon one's left thigh. Thus held, it is comparatively easy to support, even should the horse bear much weight on it in its efforts to place the foot on the ground, while if the animal attempts to free the leg by struggling with it, this may be successfully countered by merely pressing hard upon the ham-string with the left hand, which should remain in position there all the time. An important point to observe is that the leg, when held up, should not be drawn sideways away from the body, for that will hurt the horse and incite it to struggle in order to free the limb. It should be kept in line with the body, but one can draw it out backwards. In letting the leg down again one should keep the hand on the ham-string until the foot is on the ground, so as to prevent any attempt to lash out when the right hand lets go of the pastern. To insure a still greater degree of safety against a possible kick when attempting to lift up the hind leg of a horse of whose temper one is doubtful, one may as a preliminary first of all hold up its fore-leg on the same side. The right hand is used for this purpose (presuming it is near the side leg that is to be picked up), and while holding up the fore-leg one bends forward and grasps the ham-string of the hind one with the left hand. Having thus secured some hold over the latter, one lets go of the fore limb, and proceeds to lift up the hind one in the same manner as described above. By holding up the fore-leg the horse is completely prevented from kicking with the hind leg before one has caught hold of it.

RU-BER-OID
TRADE MARK REGISTERED

Lessens Fire Risks—Cuts Down Insurance

Fire Insurance Companies rate RU-BER-OID Roofing as "First-Class", and insure at the "base" or lowest rate buildings covered with it. RU-BER-OID will not catch fire from flying cinders or burning brands, and the one-piece, air-tight, fire-resisting RU-BER-OID Roof helps to smother a fire starting within.

KA-LOR-OID (Colored RU-BER-OID) has the same fire-resisting qualities, and in its soft, permanent shades of Red and Green it makes most attractive roofs. 109

ROOFING

Condition Powders.

At no season are condition powders more in request than during the autumn change of coat. Any country chemist will make them up. Here is a good recipe for a condition powder suitable at this time of year: 3 oz. each of gentian, aniseed, ginger, anh nitre, 4 oz. of fenugreek, and 1 oz. of powered capsicum. The whole to be thoroughly blended. From one teaspoon to one tablespoon full is given on alternate days, the powder being mixed with a feed of corn, which should be slightly damped, so that the powder may adhere to it. Another useful recipe is as follows: Two parts each of sublimed sulphur, nitre, black antimony, and fenugreek, and one part each of carbonate of iron and powdered turmeric. The dose for a full sized horse is one tablespoonful.—Argus.

will relieve the pain and soreness. bind it over the affected parts and it pen a piece of flannel with it and strengthening plasters. Chamberlain's liniment is cheaper and better. Dam-

Farms—1913-1914.

By instructions of the Hon. Minister of Agriculture a distribution of superior sorts of grain and potatoes will be made during the coming winter and spring to Canadian farmers. The samples for general distribution will consist of spring wheat (5 lbs.), white oats (4 lbs.), barley (5 lbs.), and field peas (5 lbs.). These will be sent out from Ottawa. A distribution of potatoes (in 3 lb. samples) will be carried on from several of the experimental farms, the Central Farm at Ottawa supplying only the provinces of Ontario and Quebec. All samples will be sent free, by mail.

Applicants must give particulars in regard to the soil on their farms, and some account of their experience with such kinds of grain (or potatoes) as they have grown, so that a promising sort for their conditions may be selected.

Each application must be separate and must be signed by the applicant Only one sample of grain and one of potatoes can be sent to each farm. Applications on any kind of printed form cannot be accepted. If two or more samples are asked for in the same letter only one will be sent.

As the supply of seed is limited, farmers are advised to apply early; but the applications will not necessarily be filled in the exact order in which they are received. Preference will always be given to the most thoughtful and explicit requests. Applications received after the end of January will probably be too late.

All applications for grain (and applications from the provinces of Ontario and Quebec for potatoes) should be addressed to the Dominion Cerealpostage. If otherwise addressed delay and disappointment may occur.

Applications, for potatoes, from farmers in any other province should be addressed (postage prepaid) to the Superintendent of the nearest Branch Experimental Farm in that province.

J. H. Grisdale.
Director, Dominion Experimental Farms.

Principles of Housing Sheep.

In preparing winter quarters for sheep a house constructed of the following plan will constitute good accommodation for the flock.

Have a frame building on a good elevation of ground with high ceilings, single board walls well battened, a good shingle roof, and lots of windows and doors so arranged that one or more mey be opened at all times without causing any draught.

Above all have a good-sized yard for the sheep so they may have lots of exercise, as this is one of the things of greatest importance, especially to the breeding eye.

My own pen has a shanty roof built at the end of my barn. The walls are single board and battened. I have also found the barn floor a good sheep pen. The main object is to keep the sheep dry, give lots of fresh air, and exercise and keep all other stock away from them.—G. H. Mark, Victoria Co., Ont., in Farm and Dairy.

To guarantee strictly fresh eggs they must be shipped twice a week, though in the depths of winter one can safely put the shipping down to once every week, and then the eggs will be guaranteed.

Tailoring for Men and Ladies

Goods by the yard for heavy long coats and suits. Buttons and trimming a specialty.

We earnestly request you to give us a call Winter Fair week and look over our goods, They are English imports and our prices are keenly cut.

We claim to have a greater knowledge of cloth than possibly any other firm in the province, having been 20 years studying the cloth problem, on the home makers markets.

Value to **you** is the result of this experience.

NEXT SHORT COURSES

---AT THE---

Agricultural College Truro, N. S.

Jan. 6 to 16, 1914

Special courses for MEN and for LADIES open FREE to all students from the Maritime Provinces. In the past these courses have been attended by people of all ages from sixteen to over seventy.

In the Men's Short Course

instruction will be given in Judging, Feeding, and Management of Live Stock of all kinds, Soil Cultivation, Crops, Seeds, Horticulture, Dairying, Veterinary Practise, Poultry, and, if requested, classes will be provided in Entomology, Botany, Chemistry, etc.

The Ladies Course

will include Dairying (especially Butter and Soft Cheese making), Poultry, Gardening, Floriculture and Domestic Science. A women's Institute Convention will be held on January 13th and 14th.

The 1914 Short Course promises to be the best course yet held. Do not fail to attend.

All Railways in the Maritime Provinces will give single fare on Standard Certificate plan.

GIFTS GALORE ARE OFFERED

In Your EATON Catalogue

JUST THINK!—Christmas is almost with us. A few more weeks and then the joyous season begins. With it comes, of course, the usual tokens of goodwill—the giving and receiving of gifts. "What shall it be?" is the premier thought in most minds, and to many it becomes a great problem indeed. Those of you who have a copy of our Fall and Winter Catalogue need have no such experience. We say this advisedly, because we believe that if you will but take the trouble to look through your catalogue you will find it a veritable storehouse of worthy merchandise. Further than that, there are many pages which list just such articles that are of popular choice and pleasurable interest.

THE TIME TO BUY IS NOW—AND THE REASON WHY

So many conditions may later arise that it is well for us to buy gifts early. To put off your purchase too long often brings disappointment. Sit down now and give this matter your earnest consideration and make your choice while stocks are large and varied. Do not forget, also, that ours is not primarily a Christmas catalogue but a comprehensive showing of articles of daily use in the home or the personal requirement.

If you have mislaid your catalogue, or have not now one from any reason, we will be glad to mail a copy free if you will send us your name and address.

THE PLAYTIME

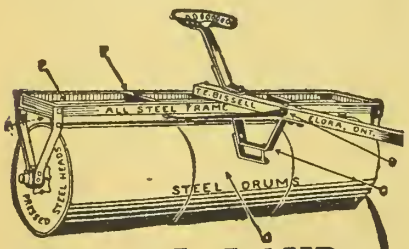
MAKES HAPPY HOMES

A great economist has said that the happy home is the very bone and sinew of our national life; but no home is as happy as it should be if the wife and mother is so utterly tired at night that she cannot be a cheerful companion in the family circle.

The greatest labor saver, the best conservator of health, strength and cheerfulness is the "Playtime" Washer. It takes the tired feeling out of wash-day. It is an efficient helpful servant that never tires and is always ready. As a power machine it is specially adapted for the country where gas, gasoline, steam engine or windmill power is available.

See the "Playtime" at your dealer's or send to us for full information.

CUMMER-DOWSWELL Limited
Hamilton, Ontario. 203



BISSELL LAND ROLLERS

are all steel except the Pole. They are braced and stayed to stand all kinds of hard work and wear well. The entire frame, bottom and all, is built of steel. The (18) anti-friction Roller Bearings make light draught.

The Draw Bracket and low hitch do away with neck weight.

The Axle revolves with the drums and there is no squeaking or grinding.

The Cages holding the anti-friction rollers are the best yet; they're MADE OF MALLEABLE ALL IN ONE PIECE—no twisting or binding of the bearings on the axle of the "Bissell" Roller. The Seat Spring is reinforced and is DOUBLED AT THE HEEL. These good features are not all of the advantages of the "Bissell" Roller. Many more good points are built into them, making a Land Roller that is "built for business," that stands up against lots of hard work.

ELORA, ONT.

The boy's appetite is often the source of amazement. If you would have such an appetite take Chamberlain's Pablets. They not only create a healthy appetite, but strengthen the stomach and enable it to do its work naturally. For sale by all dealers.

Treatment of Mare After Weaning.

Beyond examining their udder morning and evening for two or three days to see that is does not become unduly filled with milk and shows no undue heat, brood mares do not ordinarily call for any special attention after their foal has been weaned and separated from them. Their milk generally dries up pretty quickly of its own accord, especially when they are brought into regular work or are already being worked. If necessary, a little milk may be drawn off with the fingers for a few times, so as to relieve the tension, until the flow finally subsides, but it is a great mistake to empty the udder, for that will only result in encouraging renewed secretion. If the flow appears unduly active, as may be the case when the foal is weaned at an early age, and if the udder in consquence becomes much distended, an application of vinegar, repeated once or twice if required on successive days, will do good, this having the effect of making the vessel contract and reducing fresh secretion. Should the udder harden and get hot, a useful remedy is to rub some goose fat well into the skin twice daily. Lanoline may also be used for this purpose, but it is not so good. Some use linseed oil; this, however, is the least effective. Sometimes physicking is resorted to after the foal has been weaned, in order to check the milk flow, but ordinarily there is no need for this drastic measure, and it ought certainly not to be resorted to unnecessarily, for it might easily do harm. If a medicinal agent should be required, probably the best is a dose of Epsom salts, which will exert a distinctly trying effect on the lacteal secretion. The dietary of mares after weaning may be as usual, and there is generally no harm in leaving a mare out at grass if she is to be kept turned away. Only in cases when she still has much milk, and trouble on that score is apprehended, will it be advisable to keep her up and put her on dry fare for a few days till her milk leaves her.

Care of the Feet, Mane and Tail.

The care of the feet, mane and tail is probably more often neglected than any other step. Besides the usual daily brushing of the mane and tail, we should at frequent intervals wash them. Washing with warm water and castile soap, rinsing with cold water, and then rubbing till almost dry, gives good results. Washing not only cleanses the tail thoroughly, but induces a great growth of hair. The care of the hoof means cleaning out the sole with a hoof hook, washing out the sole and the outside of the hoof with water and sponge and wiping them quite dry with a rag. Many times this means the discovery of nails picked up, or stone bruises, and if carefully attended to there would be little trouble with hoof diseases. It is essential that the hoof be wiped dry after each washing, for if it is left to dry alone the hoof soon becomes brittle and liable to crack. The use of hoof preparation is sometimes visable. A very light application of vaseline is all that is ever necessary for a healthy hoof.

Skim milk is one of the by-products of the dairy that is usually undervalued. It is valuable when given to the growing chickens and laying hens, and is well nigh indispensible to the greatest success in pig raising. When feeding skim milk, it should always be remembered that protein, or muscle forming food, is its most valuable consistent, and that therefore it ought to be balanced up by other foods containing fatty elements of some sort.

Influence of the General Purpose Cow on the High Cost of Living

By Bliss M. Fawcett. Upper Sackville, N. B

THE general topic of conversation people is the high cost of living these days, amongst all classes ing. The subject has become so universal that, whenever an exhibition is opened, invariably the speakers wonder about the cost of food stuffs these days as compared with former years. All statesmen, leaders of Government, and the Cabinet members of Canada and the United States, never finish a speech without referring to the troublesome question of how to account for the high price of every-thing necessary to sustain life.

This state of things has been going on for some years. Every person has an idea of the direct explanation of the matter, but still, day by day, and month by month, the prices soar higher than ever. Some people blame the governments, and get wonderfullyagitated that our representatives will allow such a state of things. Others will bluster away and blame large co-operations for joining together and raising prices to add fresh feathers to their nest. Then a good number, mostly those who do not know a bullock from an elephant, will add coals of fire on the head of the meek and lowly agriculturist and declare that he alone is the cause of making them pay double for everything neccessary to keep body and soul together.

And still the prices rise and the lamentations become louder and louder, till now, from the Atlantic to the Pacific, the cry goes forth, "What shall we do to exist?" Surely they say, there is a remedy. To relieve the strenuous situation all classes of people are clamoring for higher salaries. Brotherhoods of trainmen meet by hundreds and demand an increase or they will refuse to move a train. Al labor organizations are agitating for better conditions, even the humble senators of Canada, during last season declared they could not live at Ottawa for six months on $3,000 but must in future have $5,000, annually.

The universal cry then is, "Oh, brother man, relieve us, we beseech thee, of the terrors now, and those that are to come."

John Gardhouse, Esq., of Ontaro, at the live stock convention at Ottawa in 1912 told us, that in order to keep up the high standard of the Shorthorn cattle, it would be necessary to pay more attention to the milking qualities of that breed.

I will go farther and say that I believe the only sound solution of the high cost of living is in the milking Shorthorn or the general purpose cow.

Now I hear men say "what an extravagant expression, that a Shorthorn with a large udder can possibly be the means of relieving all Christendom of the motly question of, 'Where withal shall I be clothed.' "

Yet it is a stubborn fact, my Canadian farmer, that unless we restock the old farms of this fair Dominion with a different class of stock from what we now have that we can never produce what has been our privilege for years past.

We know pretty well if we have farmed at all that live stock is the bank of any good farmer. We know also that all humanity must eat beef, pork, butter, cheese, etc., daily..

I have said that I believe the Dairy Shorthorn is the only panacea for renewing the old worn out farms and the only animal that will give a profit, not only as a milk producing but an animal capable of raising a steer which when finished will bring the highest market price.

Barnann has said "that the people like to be fooled part of the time; but you couldn't fool all the people all the time." We well know there are two distinct classes of Shorthorns. One class will produce from 6,000 to 10,000 pounds of milk annually and raise a steer large and rangy with plenty of bone, which when fattened, will bring from six to seven cents a pound, live weight, and average 1600 pounds at 3 years of age.

The other class is a low down animal, short-legged, very compact and has been bred for years to appear in the show ring, so square and blocky that the judges universally say, this is almost a perfect animal. This creature's dam would not produce enough milk to raise a pair of twin boys.

That beast, my dear Canadian beef eater is the one animal that has caused you to dig deep into your purse to pay for the juicy steak.

Well now, says the beef ring judges, isn't that preposterous indeed, to say such things. Haven't we, for years, been getting the exhibitors to get the animal more symmetrical and so square back of the shoulder and broad in the back that at least, this beast has not only beaten everything in Canadian and United States fairs, but has brought when sold, as high as 13 cents a poand, live weight.

Yes, gentlemen, this is all true enough and so correct that I say again and again that this very animal is the direct cause of the high price of meats the world over.

I don't intend to say anything against fat stock shows or exhibitions because I believe they do a lot to benefit the agricultural class and to help make life worth while.

But I will say, Mr. Editor, that the everlasting education of so much perfection in the show ring has caused many a Canadian farmer to try and be the individual who will be honored at the fair with this beautiful beast for he is certainly beautiful to behold, yet to produce this model the milking qualities have been neglected altogether.

In many cases the calf has been taken from its dam and reared by one or two dairy cows, as its own mother would not produce enough butter fat to oil a pancake griddle for an ordinary sized family.

I say in that so many farmers have followed this line of education that now the world finds itself face to face with a beef famine. This is so because it does not pay any man to raise a calf to maturity by taking all its mother's milk for the first six months of its life.

In fitting the exhibition steer only one individual can get to the top. His competitor, with an animal perhaps almost equal to the other goes home without any prize money and cost more to rear than his carcass will realize for beef. He tries the game a few times and finally says it doesn't pay unless we get the red ribbon. Finally he stops and finds himself with a dozen cows with udders about the size of a goat's. me truly concludes it doesn't pay to raise a calf for the beef alone.

That being the case he wonders to himself. What will I do? I will get Holsteins, Jerseys, Ayrshires or Guernseys and become a dairyman. So he does and makes a success of it, too, but does that help the beef industry? Not a bit. If he raises the steer calf, from any of these breeds, what happens? Why, he is put on the Toronto or Chicago markets half fattened with no beef build and is sold for 2 to 3 cents a pound and is used for canners or fox feed. Next time he gives the calf at birth a tap under the ear with a hammer and gives the carcass to the cows. This process has been going on for years. Less cattle are raised year by year, while the population has increased and more beef is consumed than formerly.

Now I hear the people say, "where oh where, is this wonderful animal that can do so much to relieve the people of this fair Dominion."

Is she like the new theology, a development of the monkey that has only recently breathed the breath of life? Or is she the animal that all humanity has so long sought alter, "the missing link." It is quite probable she sailed with "Noah in the Ark" as he would scarcely have dared to set forth on so long a voyage without any of the dairy breeds when so much milk and beef was required to feed his flock.

We look to the dear old mother land, Great Britain, now-a-days for almost everything that will better the conditions of man. We point with pride to the many excellent Shorthorn bulls that have been imported from Scotland costing the Canadian breeder one hundred guineas each.

Where we have failed is in not importing from England enough of the dairy type of Shorthorns. We know very well that many farmers have their own herds of from 10 to 30 cows that produce milk equal to the best dairy breeds on earth.

My father, who is now an old man, imported fifty years ago, one of those animals landing him at Baie Verte in a sailing vessel. As a boy my mother took me to the barn and gave me my first lesson in milking. the progeny of this animal. Many the cow have we had from that stock that required 1½ pails to hold her milk. A good number of these bulls at that time were placed asound this section of New Brunswick.

In consequence of breeding quite generally this kind of animal hundreds of excellent beef animals were raised complete,y filling the markets of the Maritime Provinces. Thirty years ago prices were good in Great Britain with no embargo. The town of Sackville where I live, had the grand distinction of shipping the first cattle from the Provinces if not Canada that ever crossed the Atlantic. I had the pleasure of taking over 100 head the last shipment ever sent from this section. They sold at auction in October, at Forfar, Scotland, in competition with thousands of Scottish cattle and averaged £21 each.

Shortly after this, Canadian cattle had to be slaughtered on arrival, and in consequence, not a beast has left these shores for twenty-five years.

Somebody will perhaps conclude that those 100 steers must have been pretty good stuff. Yes they were, but hundreds could be gathered at that time, that were just as good. And they were of the offspring of the general purpose cow, never seeing new milk but perhaps the first two weeks of its life.

Everybody kept a good number of hogs to use up the large quantities

With this kind of farming the turn off was butter and cheese, beef and Pork. What has happened since that date the Ontario Breeders of Short-Shorthorns have imported from Scotland hundreds of the low set bulls to suit the education given in the show ring.

In turn some of us have bought many bulls from Ontario. They have been bred to the good old General purpose type and repeated so many times to the low set bulls that, now we find ourselves with cows giving about half what they did in former years.

The result is that not one quarter the number of cows are kept, as, were here 25 years ago.

You will perhaps begin to see now my city brother why you pay so high for your beef.

Unlessa change is made, and that, very soon, our surloin roasts will cost so much that only the rich will be able to buy them.

Wellthe beef ring judge says, you blame the low set shorthorn for all this trouble, give us the remedy.

Certainly Sir, first, at all the Fat Stock shows and exhibitions in Canada and United States, give large preuims to the General purpose cow and her offspring.

In giving rewards make it compulsary that a statement of the quantity of milk that the dam has given annually be handed in when entries are being made.

Then when a rangy well built steer comes into the ring with some daylight under him and looks as though he hadn't all his life been getting all the butterfat of two cows and then everything that would tempt the beast to lay on more flesh.

I say when he appears tell the people this is the chap that is the salvation of the nation.

Then let a number of us wait on the Provincial Governments of Canada and say, we wish you to import from England a large number of the heavy milking shorthorn blood, whose dams have produced nothing less than 6,0-00 lbs. annually. Have them sold in different parts of the Provinces, and to be owned by the Govt. until they are 10 years old.

Have them exchanged three different times, during the 10 years, after which the bull becomes the property of the last owner. In this way either private individuals or agricultural societies could purchase an animal, and after 10 years it would become the owner of the purchaser.

I will venture the assertion that I believe these bulls well selected will sell at auction and pay cost price.

What would happen in 10 years of such an education?

People from Vancouver to Halifax would begin again to raise stock. In three years hundreds and thousands more steers would be offered for sale. In 10 years this North American continent would be growing cattle enough to supply its own markets and have enough and to share with the mother land.

I will assert again that if this policy is carried out that many vexed questions will be solved.

Instead of the boys rushing to the cities as they do now, they will see that nothing on earth is so uplifting as the noble pursuit of digging into the earth and making it produce every living thing so necessary for the voyage through life. By keeping more stock he will see the futility of his soil increased. Go with him into the meadows and behold the contentment of a well fed herd of animals.

Go into the market and you will find (not produce imported from the ends of the earth to feed the people) but instead there will be everything of every kind grown in our own fair land.

I say my brother farmer, restock the old farms with the General purcow then the north winds of winter the draughts of summer or the floods of spring will in no wise disturb us, because our barns will be filled with plenty and no man need want.

Come back from the city my boy, roll up your sleeves to the shoulder, don't be afraid to milk half a dozen cows at any time. In doing these things the rose will come to the cheek, our fathers will rejoice that the prodigal has returned. Your purses will need enlarging.

Peace and contentment will rule in the land, and our beloved Canada will "blossom as the rose."

Respectively.
BLISS M. FAWCETT.
Sackville, N. B.

This picture is one single hill of potatoes in each case grown from home mixed fertilizer and a high-grade factory mixed article. The hills represent an average for the field and the rows were side by side. Everything was equal so far as we knew with the exception of the difference in the fertilizers. The home mixed goods cost about $29.00 per ton, while the factory mixed article cost $42.00. There was as much difference in the crop as the picture would indicate.

A Live Agricultural Society.

The annual meeting of Agricultural Society Na 23, held at Kingston, November 25th was one of the best in the history of the society. Owing to the awakened interested in the more economical purchase of commercial fertilizers a very large number of the members were present at the meeting and close attention and enthusiastic interest marked the proceedings throughout.

The President, Mr. Geo. Bruce, of Kingston presided at the meeting. The first business of the meeting was the presentation of the financial and annual reports by the secretary, Mr. A. R. Wetmore, of Clifton. The reports showed the society to be in a flourishing condition. In addition to the handling the usual quantity of fertilizer and seeds, the society had during the past year purchased a number of pure-bred Jerseys and Ayrshires, which later were sold by public auction to the members of the society.

Followingthe reports of the secretary the subject of purchasing commercial fertilizers and of reducing the cost was discussed. The judge gave an outline of a scheme which would reduce the price paid at present by the society by about eight dollars and fifty cents per ton and mean a saving of practically fifteen hundred dollars to the members of this society. Arrangements could be made with the bank to make this purchase for cash providing the directors of the society sign a bond guaranteeing the payment for fertilizers so purchased. ference held in St. John recently between Dr. Landry and his agricultural officials and the secretaries of the Agricultural Societies. At this conference it was agreed that, if the societies would combine and buy fertilizing ingredients, though a committee, as one individual the government would guarantee the bonds of that committee. If this scheme is carried out, and every effort is being made to make it go, a further reductiom in the price would be made. The societies would get the benefit of the purchasing of large quantities and of buying seed from the syndicates.

The secretary also spoke of a con-

R. J. Murray of St. John, who has been interested for some time in reducing the cost of fertilizers, and H. B. Durost, Provincial expert on fertilizers were present at the meeting and both followed the secretary and pointed out the benefits of purchasing through co-operation and from the use of universal fertilizers.

The proposal as set before the meeting was well received and the close of the meeting was marked with enthusiasm. The following resolution was moved by Mr. E. S. Carter of Rothesay and carried Resolved, That this society authorizes its directors to make such financial arrangements with any banking institution as will enable them to purchase fertilizer ingredients for the lowest cash price.

A Season's Work with Fertilizers.

Editor Maritime Farmer
Sussex N. B.

Dear Sir,

An outline of results from the work undertaken in the Sackville and Westmorland society last season with raw chemicals as a source of fertilizer for our crops may be of interest to some of your readers.

Our attention has been drawn to the desirability of using this class of fertilizer material from many experiments on different crops in a small way and this past season our executive decided to purchase in quantities for the members. We bought in car lots and had the farmers come to the car upon its arrival and get his supplies, thus doing away with much handling and storing. The large percentage of the mixed goods were made up for potatoes and would analyze what is commonly known as a 4. 8. 10 p.c. mixture.

To make mixture of this kind we would take 1000 lbs. of high grade Acid Phos., analysing 16 p.c. Available Phos. Acid and put that on the barn or shed floor and spread it all out level. This is not lumpy and is all ready for mixing. Next we would take 400 lbs. Muriate of Potash and place that evenly over the Acid. Phos., Next would come the Nitrate of Soda and we want 440 lbs. of this. This material is generally more or less lumpy and in order to make it fine we put on the bare floor and spank it with the back of a shovel or tamp it with a block of wood with handle attached. After this is stirred and pounded for a few minutes it is ready for the other pile and is placed on top.

The pile is now shoveled over twice doing it of course as carefully as you can, seeing that the shovel full is distributed over the surface of the whole pile. The material is now ready for use and may be placed in bags or barrels. While the amounts mentioned here will give you a few lbs. short of a ton weight you will get the ton value and besides will not be paying freight and handling a lot of useless fillor.

A ton of material made up in this way is a very high article and you can easily see it could not contain much filler to the ton, but in making up what is called a low grade article as for example a 2.6.5 p.c. (high grade) 750 lbs. and Muriate of Potash 200 lbs. This only makes a total weight of 1170 lbs. and in order for the manufacturer to make this up to 2000 lbs. or a ton a large amount of useless material must be added, because I must say right here that only the guaranteed available part of fertilizer is paid for and to make one of this analysis it only requires the amounts mentioned.

Now in mixing these materials I must say that any farmer who can handle a barn shovel can do it and do it well. The material will give no trouble in a potato planter and now we come to the results. Our members were all satisfied perfectly and some even go so far as to say that they will not buy commercial fertilizer at all after this, il they cannot get raw chemicals' Some of us never had such crops (potato) io our experience, while for turnips a different composition of the materials gave the growers immense yields.

A few words as to the cost and I am done. Factory mixed goods with the first mentioned analysis usually retail for about $45.00 per ton fall payment. Of course we bought our chemicals for cash and a ton of this mixture would only cost the farmer $30.00. Fertilizer with the second mentioned analysis usually retails for about $33.00 per ton, while this of ours could be sold for about $16.00 per ton.

We are showing our continued faith in this matter by already placing our orders for enough chemicals to mix 200 tons of fertilizer. No more expensive goods for us. If there is any particular point I have not made perfectly clear in this matter I will

be only to pleased if possible to give the desired information.

Trusting that these few remarks may be of use I am

Respectfully

Sackville and West. Agr. Sc.

C. Fred Fawcett, President.

Glengarnock Victor II. is King of all Grades.

J. D. McGregor of Brandon has pullled off the Grand Championship of the International Live Stock Show of Chicago, the bigest show of its kind on earth.

Glencarnock Victor II. has downed all comers in the steer classes, and there were scores of them. He was first in the class as a grade yearling then champion of all grades and cross-breds, and then champion of all yearlings, and finally grand champion over all pure breds and grades. He was bred by J. D. McGregor. His sire was Golden Gleam, and he is out of the same dam as last year's champion. His grand-dam was an ordinary red nurse cow. He has been fed on nothing that cannot be grown on any Canadian farm—namely, barley and oat chop, turnips, oat sheaves, prairie hay, and a very little linseed meal. He would not know corn if he met it.

The greatest triumph of all was that he was fed by young Harry Bowman, a boy not yet seventeen, who had no special training as a feeder, but he has cared for his calf from birth, and Mr. McGregor would not allow him to be interferred with by any of his older and more experienced feeders.

It is the first time in the history of the International that the Sweepstakes Grand Championship of the show has been won twice in succession by an individual breeder. Once previously Ames College won two years in succession. It is the third time the championship has gone to Canada. In addition to this win, J. D. McGregor also won this morning the first place in the class, three steers out of one sire. These steers were all the get of Golden Gleam, who sired the grand champion.

In the sheep barns Ontario continued to do herself proud. The grand championship to John Campbell of Woodville was awarded almost at the moment when the McGregor steer topped the cattle rings, and was an exact repetition of the performance last year. In 1912 Campbell won the pure-bred Shropshire wether, this time with a very handsome grade of the same breed. Experts pronounced him a superb sheep. The champion car lot of sheep came from Idaho and were fed by Knollin and Finch.

Canada won the bulk of honors for fat Lincolns, having the champion wether, owned by H. M. Lee,, Highgate, Ont., who also won three firsts. Fat Cotswood classes were all won by J. B. Brien, Ridgetown, who also won the championship in the Dorset division. Fat Oxford prizes, including firsts and championship, went to R. H. Stone.

There were 783 entries of Percheron horses, and the major portion of these entries were on the ground, Chicago has had some magnificent shows of Percherons in the past, but nothing to touch the 1913 show in either numbers or quality. Every large Percheron stud farm in the United States was represented, and not a few of the smaller ones. Robert Graham of Claremont, Ont., was one of the judges.

R. R. Ness, Howick, Quebec, made a big sweep in Ayrshire winnings.

Middleton Wool and Fur Company.

For several years past our townsman, E. T. Neily has been studying the sheep raising problem. While living on his farm at Brooklyn and caring for a small flock of sheep, along with the other branches of farming, he had an excellent opportunity to become acquainted with the problem.

As he watched the steady decline of the sheep industry in the Maritime Provinces and the growing demand for all the products of the sheep he saw the improving conditions of this department of animal husbandry. The fact that during the last dozen years theprices for mutton and lamb have increased by a 100 and for wool and pelts by 50 to 75 per cent and that the markets are calling for all these products convinced him that there is a profitable field of investment in sheep raising if but conducted in the right way.

After moving to Middleton last year Mr. Neily began to talk the sheep industry to our citizens, and found such a ready response that he decided to organize a company. Accordingly on March the first last the Middleton Wool & Fur Co. Limited, was organized with authorized capital of $30,000. The directors of the company are: Dr. S. N. Miller, president; Capt. J. H. Charlton, vice-president; E. T. Neily, managing director; Mayor Gouncer; Dr. F. S. Massinger; A. W. Allen and Capt. F. A. Brown. J. R. Allen is secretary-treasurer, W. G. Parsons, solicitor the prices for mutton and lamb have bankers.

The first intention was to raise $6000 or $7000 capital and start sheep ranch in a small way, but as the problem was examined and the experience of sheep ranches in other places compared, it was seen that the best results would be obtained by securing a caretaker especially trained in the work, that he could superintend a large as well as a small flock, and that the sheep must be guarded both night and day. The advantages of going into the enterprise on a larger scale than at first intended were therefore recognized. The readiness of our citizens to subscribe to the stock list also encouraged Mr. Neily to enlarge his plans.

At present about $12,000 of capital has been subscribed, nearly all of which has been paid up. The remarkable fact in this connection is that stock is practically nearly all held in Middleton. When we consider the readiness with which in the past our citizens have subscribed capital in distant enterprises and their reluctance to invest at home, this result is creditable both to Mr. Neily and our citizens;

On Saturday last I accompanied Mr. Neily on a visit to the company's ranch. I was agreeably surprised to see the progress which, in a quiet way, has been made. Probably many of our readers scarcely knew that there was a real sheep ranch within two or three miles of Middleton.

The ranch is located in that rich, but little developed territory to the westward of Middleton midway between the Post road and the Brooklyn road. Over 130 acres of this fertile land lying just south of the H. & S. W. railway line was purchased from E. T. Neily and Isaac Moore and about 370 acres to the North of the Brooklyn road and extending up the side and over the North Mountain was bought from Chas. Wright and Oscar Neily.

An elevation in the first mentioned block of land afforded a suitable place for winter quarters for the sheep. Accordingly in September last a contract was given to W. K. Beals to erect four barns each 75x20 feet. A residence close by is also now being completedf

Beforetheir plans were carried out, however, James A. Teifer, of the live stock branch of the department of agriculture, Ottawa, was consulted. After a visit to Middleton Mr. Telfer wrote, "Having made a personal inspection of the property and given the matter some careful thought, I cannot help but say that for sheep farming the situation is ideal, and by careful management the business should be made to return large profits to the shareholders."

In October the sheep, which were selected in the province began to arrive on the ranch. There are now 200 sheep on the grounds and 100 more are expected before the end of the year. The intention is to work into thoroughbreds, and the Oxford Down is the breed that has been chosen. On Monday four fine thoroughbred rams of this breed arrived from Ontario for the company.

For caretaker W. A. Hayden has been engaged. He was reared on a sheep farm near Birmingham, England, and is a trained shepherd. He informed me that he is much pleased and the prospects are excellent for successful sheep raising.

On the land purchased from Mr. Neily by the company there has been a large skunk colony for many years Skunk raising is something which Mr. Neily has also been studying for some time and he believes it is the safest and one of the most profitable lines of fur farming. The price of pelts which a few years ago was fifty cents is now from $4.00 to $10.00, probably averaging $5.00. Skunks multiply rapidly, as each female raises a litter of from four to eleven yearly.

Five acres of the ground occupied by the skunk colony is being enclosed and protected below the ground after the manner of a fox ranch. Twenty enclosures twenty yards square are being made within. Five dens will be made in each of these yards.

About 120 skunks are now on the ranch. A winter burrow in which they can hibernate is being built in each yard. Five females and a male will spend the winter in each of these. In the spring at breeding time the males will be femoved and each female will be given a separate den.

The nearer the skunk is to a perfect black the more it is worth. It is the intention to import black males from a noted ranch near Chicago and breed toward the pure blacks.

The aim of the company is to increase the capital to about $20,000 With this secured the number of sheep would be increased to 1000, the skunks to 500 and possibly the breeding of thoroughbred horses and cattle would be taken up.

With the fine property secured, the enterprise well organized, the readiness with which all the products of the sheep can be disposed of at high prices and the hardiness and prolificness of the skunk, Mr. Neily believes that his enterprise offers to investors something which will prove highly remunerative and comparatively free from risks.—F. E. Cox, Middleton.

The Multiplying Power of Good Seed

In connection with the proposed auctioning in pint lots of Paul Gerlach's prize winning bushel of Marquis wheat, grown at Allan, Saskatchewan and successful in capturing the sweepstakes award at this year's Dry Farmed Products Exposition, Secretary Burns has made a statement that is worthy of attention. He says:

"Planted next year on a seed plot 40x40 feet and properly cared for, a pint of this wheat should yield enough good seed by the third year to plant a 240-acre farm."

When one remembers that it takes 64 pints of seed to make a bushel, and that one pint would have an increase 55,360 times to plant 240 arres with one bushel to the acre, it looks like as though this is asking that single pint of seed to do something almost miraculous. But let us do a little figuring. Supposing one obtains a yield from 25 bushels rom one bushel (not at all an impossible or unusual result where good care is given and good seed is used) we find that by the end of the third season, continuing at this rate of multiplication, one has 15,625 pints, equal to 240 bushels, with still 265 pints left over. This would enable one to seed the 240 acres with just a trifle over one bushel and one pint per acre.

There is a useful moral to be pointed right here. Many farmers despise small lots of seed and make little or no effort to keep them separate for multiplication purposes. They have not grasped the fact that small lots multiply rapidly and that, no matter how small the nucleus, it is worth caring for if it is really of superior quality. A few years ago one of our leading Canadian farm journals even went so far as to condemn the sending out of three pound lots of pure seed from the Central Experimental Farm at Ottawa, claiming in effect that no self-respecting farmer would ever multiply such a trivial amount to any practical proportions. The writer of this article, out of his own personal experience with these identical samples of seed, knows that such a contention is all wrong, and that three pounds of seed, or even one pound of seed, can produce enough to seed a whole farm in a very short number of years. Why, our new hybrid varieties of grains, like the Marquis wheat, for example, have been bred up from a single kernel!

Let no farmer who has a small lot of seed of high grade quality despise its lack of bulk and lose it by throwing it into the thresher with the rest of the crop or doing away with it in some other foolish way. Take care of it; beat it out with astick the first year if necessary; no one will be hurt by having to do this. And in three years it may seed the farm. Take care of all superior lots of seed, no matter how small.

Island Seed Oats Give Results in Australia.

At a meeting of the Banner Oat Club held in Summerside recently the secretary had several very pleasant communications to read to those present. Among them were the following:

"Dear Sir,—Your letter of inquiry dated Nov. 15th duly received. In reply I have much pleasure in stating that the seed oaes purchased from the Banner Oat Club of Prince Edward Island were received in good condition last spring and were distributed to different parts of the municipality by members of the Good Seed Association of Melbourne and in every case they have proved entirely satisfactory.

This has been a good year for oats in this part of the township.

One of the farmers told me over the phone this morning that he had threshed four hundred bushels of splendid oats from your seed from fifteen bushels sown. This is a fair example of how your oats turned out. I need not say more.

Wishing the Banner Oat Club every success, I remain,

Yours sincerely,

J. J. Brightin, Sec'y-Treas.

SHORT COURSE AT THE AGRICULTURAL COLLEGE, TRURO

Arrangements are being completed at the Agricultural College, Truro, Nova Scotia, for the most complete Short Course held in the history of the institution. The buildings which have been in the course of construction during the past two years, are now completed; the faculty has been augmented; and the laboratories and class rooms and stable equipment are all in the best of order.

In previous years, with much less accommodation, the college management have been able to cope with a Short Course class of considerably over 300. The provisions now made will make possible the carrying on of even larger classes and with much less crush.

Never has the college been in such a shape to give instruction in live stock! In the dairy stables are to be found a collection of cows, several of which will probably be producing during the Short Course from three to four lbs. of butter per day. Only last week a two-year-old old heifer bred on the College Farm produced 18.3 lbs. of butter in seven days. The opportunity to examine such stock both in the stable and in the judging pavillion is an education in itself. Great interest too will attach to the dual purpose Shorthorn herd which is being gathered together on the College Fgrm and which will form the centre of some interesting discussions on the place of the dual purpose cow in the Maritime Provinces. Equally interesting will the instruction be in horses, sheep, swine and poultry!

The facilities for instruction in Horticulture have been very much improved during the past year and it is planned to give in addition to the instruction in orcharding, a most thorough course in vegetable gardening. In this connection the Horticultural Superintendent is just now making a specialty of mushroom growing and it should be a matter of peculiar interest to see these valuable fungi that can be sold at from 50c to $1.00 per lb. growing and being harvested.

Equally interesting and instructive will be the work in the various departments, but it is impossible in the columns of a paper to give any accurate idea of the extent and thoroughness of the instruction. Every farmer and farmer's son in the Maritime Provinces who can arrange to leave home from January 6th to 16th should certainly plan to be present.

A Short Course too will be given for ladies at the same time and Miss Fraser, who has been appointed Superintendent of Women's Institutes in Nova Scotia, is preparing a most interesting and attractive program for this course. Instruction will be given in Domestic Science, Dairying, Poultry Raising, Flower and Vegetable Growing, etc.

All that it costs any student from the Maritime Provinces to attend this Short Course is a single railway fare and board for ten days. Tuition is free. In previous years students have attended whose ages have ranged all the way from sixteen to over seventy years and we are safe in stating that from no single line of educational work has so much good accrued to the larmers of the Maritime Provinces.

CHEAPER FERTILIZERS FOR THE FARMERS

The much mooted question of cheaper agricultural fertilizers for the farmers of New Brunswick, has after years of discussion at the New Brunswick Farmers' and Dairymen's Association meetings shaped into definite action.

A week or two ago several interested farmers met Dr. Landry, Minister for Agriculture and J. B. Daggett, Secretary for Agriculture in St. John and laid a scheme before them which met with the approval of the Department.

A central organization is being incorporated which will be unpolitical and known as United Farmers Limited, whose bonds will be guaranteed by the Government. They will purchase fertilizers and fertilizing ingredients direct from the sources of supply and supply it to the farmers at cost plus incidental expenses through their agricultural societies. The executives of the local agricultural societies will give the bonds of their societies to the central organization for whatever amount they may purchase. The societies will in turn collect the cash or its equivalent given by the users of the fertilizers.

So great will be the saving to our farmers in the purchase of even small quantities of fertilizers that they cannot afford to remain outside the membership of their nearest agricultural society. In some cases the saving will amount to fifty per cent. of current prices.

WHAT EDUCATION IS DOING

Is it any wonder that the boys and girls have been anxious to get off the farm, until, if perhaps they have been compelled to remain there by untoward circumstances or have not had the vitality or strength of character to tear themselves away, they have become so dulled in mind and body that relief from their burden of toil and isolation would have failed to bring its desired end?

It were not possible that this should have been the condition of every farm or every farmer, but it has been sufficiently true to have made an almost irreparable injury to the standing of the farmer among the men of all other business and professions. And there has been a change. Education is bringing the profession and the practise of farming into a condition which is somewhat commensurate with its importance as that which provides life and comfort for the people, turns the wheels of commerce and makes possible all that we enjoy and all that life worth living as well as possible. Education is making the life and work of the farmer less a sordid pursuit, which it never should have been. Education is making the farmer the independent man that song and legend have long declared he ought to be. Education is bringing home to the youth of the farm, the young man and maiden, the joys, the beauties and the satisfaction of the country and is keeping them upon the farm where they belong and where we most need them.

A long time ago, no, not so very long ago there was an idea prevalent that education would take a young man or a young woman away from the farm. The education of that day would and did do just that thing. But the education of today, the education of the farmer, is a different education. It is not the narrow kind that left a man fit for only a profession which required good clothes every day in the year; it is an education which fits him for the most noble profession of all, and for the work on which all mankind is dependent.

Today the man who sneers at education is to be pitied; always he was to be pitied, but in these days more than ever, for the sneers show how little he has kept pace with the progress of the times.

FARMYARD MANURE

Farmyard manure constitutes the basis of successful farming and should be cared for as much as any crop on the farm. The main thing is to maintain its quality, as bulk may add notning to its value. In many respects farmyard manure is the most important factor, because to a considerable extent the yield of the other crops is more or less dependent on it, so that in securing a large quantity of good manure, the farmer is aiding very materially in increasing the yield of the others. Profitable farming must have a foundation, and the best foundation is manure, far it not only influences the yield, but improves the quality of the products of the farm, and as the better quality realizes an enhanced price, the aim should be to excel in this respect. The fault of many who accumulate a large manure heap is that they rely too much on the quantity. The more concentrated the plant food in the heap, the lower the cost of spreading; hence quality should be maintained by not allowing of loss from rains or by overheating of the heap.

All manure, it makes no differecne whether it is hauled in the autumn, winter or spring, should bespread at once, and should never be left in piles, even for a short time, if one is to secure the greatest benefit from its application. This principal in the use of farm manure is not to be overlooked by the progressive and up-to-date farmer, and on all farms where the best results from manurial fertilizer are obtained the product of the stables is distributed upon the land as fast as it is made. The old-time piling method is an expensive one, not only from the standpoint of the real value of the manure, but in the matter of hauling as well. When left in piles the manure is leached by rains and the soil enriched by it is only of limited area, whereas, if it is finely and evenly spread over the entire surface the benefit derived is general and of far greater importance. In spreading manure, the finer it can be made and the more evenly it can be distributed over and through the soil, where it may be of use to the roots of all plants, the better results can be expected from it. Because of this fact the spreading becomes an essential element of the successful use of barnyard manure. In the past, spreading by hand has been the most common, and, in fact, about the only manner of distributing the material over the soil, but now the machine spreader worked by horse power is largely used and with most excellent and profitable results. Where mechanically distributed the manure is made very fine and reaches every root of the soil, just where it is of the most use and value. Whenever it is possible, we believe, the farmer should use a manure spreader, as it will be found one of the best paying investments ever made upon the farm. It will pay not only because it prepares and distributes the manure in the best possible manner, but because it will save much time and labor in handling. The saving of labour alone, where one has a large quantity of manure to apply annually, will soon go a good way in paying for the machine, to say nothing about the great additional gain secured from the use of the manure itself.

STATE AGRICULTURAL CONVENTIONS

The beginning of the year will introduce the annual provincial conventions season for 1914. This is an important period in the history of any Province. It is the season of the year that a rendering of accounts is made, the balancing of the books, the taking of an inventory and the planning for renewed energy for the work of the new year. The agricultural associations of all kinds have formed a kind of co-operative interest in holding their annual meetings, which is highly advantageous to the farmer and stockman, and every other specialty of an agricultural kind.

The organization of the persons engaged in each line of agricultural employment into associations for the mutual advantage of its members is the greatest incentive possible in the improvement and building up of these special lines of industry. This co-operative influence is a stimulus to better work, more study and direct investigation into the merits of the occupation, as a permanent source of revenue. It is the means of profitable production in our wordly pursuits, that is left entirely to our own choosing, and our best efforts should enter into every avenue of education that will assist in bringing results.

(Concluded on page 171)

Colchester and Cumberland Boys Win Generous Prizes

A former Nova Scotian who is now residing in New York and on whom Dame Fortune has besyowed a fair share of this world's goods, very generously donated a sum of money in 1912 to encourage turnip growing in the counties of Colchester and Cumberland, N. S. The college authorities at Truro were named as the custodians and awarders of the prizes.

The prizes were open for contribution to boys between 15 and 20 years of age who grew the best acre of turnips on their father's or guardians' farm, the assessed valuation of which did not exceed $3000.

So successful was the competition conducted in 1912 that the donor repeated his generous offer in 1913 and following is a list of the prize winners:

The first prize was $75.00, 2nd, $50.00, 3rd, $30.00 and 4th, $20.00.

It was further stipulated that the money was to be used:

1st.—For acquiring an agricultural education.

2nd.—Purchasing improved pure-bred live stock.

3rd.—Underdraining or otherwise the farm.

4th.—In such manner as may be approved by the following committee.—Prof. M. Cumming, Chas. Hill or F. L. Fuller.

The fields were judged by a scale of points, totalling 100, and in addition to the above named prizes the Provincial Government gave the 5th, 6th and 7th highest score $5.00 each, and the 8th and 9th $3.00 each, in each County.

The judging was done by S. J. Moore and F. L. Fuller of Truro and H. E. Brown, of Wallace Bay.

In Cumberland County there were fifteen competitors, with the following winners:

1st.—Manford Oulton, Lorneville, score, 90½.

2nd.—Roy Jackson, Lorneville, score 89½.

3rd.—Donald Tuttle, Wallace Bay, score, 88½.

4th.—Russell Wells, Wallace, score 85.

The next three winning $5.00 prizes were:

Laurie A. Brown, Pugwash, score, 83½.

Chas. T. Plimmer, Wallace Bay, score, 83½.

Lyman Chapman, Hastings, score, 83.

The next two winning $3.00 prizes were:

Geo. I. Herrett, Windham Hill, score, 82.

Alton B. Forshner, Wallace Bay, score, 81.

In Colchester, there were fourteen boys after the money, the successful ones being:

1st.—John A. Semple, Brule, score, 89.

2nd.—Frank S. Crowe, Old Barnes, score 88½.

3rd.—Earl Jennings, Masstown, score, 87.

4th.—Albert Burrows, Valley, score, 86.

The next three winning $5.00 prizes were:

Jas. Creelman, Halfway Brook, Stewiacke, score, 85½.

Lloyd Johnson, Cross Roads, Up. Stewiacke, score 84.

Baxter Fulton, Bass River, score, 82½.

The two winning $3.00 prizes were:

H. Kilminster, Mid. Stewiacke, score, 81½.

Wallace Bowers, Great Village, score, 81½.

This is the second year for the competition and last year, owing to the season being a very wet one, the results were largely due to soil conditions.

This year, although the best field did not come up to last year's yield, the present year's average is very much larger.

The outstanding feature this year was the advantage of thorough and continuous cultivation. Close observation of last year's growth helped many of the competitors. On the whole, much better seed was used and while last year some of the boys in their anxiety to win used too much stable manure and the result was rough turnips, this year these boys got better results with less stable manure and a little commercial fertilizer and plenty of cultivation. Others experimented with different kinds of fertilizers and adopted other methods which go toward the development of the highest type of farmers.

Another feature worthy of note was that the best turnip fields in the Province were those in the Competition. The largest yield was 1350 bushels per acre. The average of the prize winning fields was 1181 bushels.

That the gentleman who donated the money for this competition is generous is obvious, yet he is more than generous. In electing to encourage the growth of a crop which occupies such a prominent place in successful farming, and one the growth of which our Maritime Provinces is particularly well adapted, he has shown excellent judgment. Futhermore, the conditions of expending the money go to promote the highest ideals and the more lasting benefits to agriculture. If there are other sons of Maritime Canada who have the welfare of our Provinces at heart, they cannot do better than to follow so worthy an example.

Implements cost money. Put them under cover—NOW.

A Good Road in Compton County, Que.

Successful Ploughing Match at Lennoxville, Que.

Encouragement of Ploughing Matches

Ploughs have been modified to suit modern ideas of cultivation, but the change has been more towards speed in turning over the soil than in better methods of doing this. May it not be that speed in ploughing has been gained at te expense of efficiency in the work done?

Good ploughing is not so much a question of good ploughs as good ploughmen. Of late years we have depended more upon the plough itself than upon the man between the handles. Improvement in ploughing can be brought about by training men and boys to do better work.

In Ontario and Quebec there was a time when the annual ploughing match was an event of unusual importance in many localities. Interest in these competitions seems, unfortunately to have died out, particularly among the younger men. While they may not have been all that could be wished for from an educational standpoint, they were certainly an incentive to good ploughing. The scope of such matches could be widened to include contests in soil cultivation on stubble land and testing the different kinds of implements for cultivating the soil. Usually there are prizes given for the best plough-team and equipment. Why not extend this valuable feature by giving several prizes for teams and also for colts, thereby encouraging the raising of good horses? A few pithy addresses on farm topics would make the occasion still more instructive and interesting.

To get the best results from a ploughing match, it should be managed by the local Farmers' Institute or some kindred organization. Municipal Councils might very properly be urged to contribute, because undoubtedly the money so spent would assist greatly in improving the crops and stock of the neighborhood.—J. F.

Farm Machinery--Its Great Abuse

While it is true that many farms are not equipped as they should be with proper machinery, it is also true that hundreds of dollars are lost in unnecessary outlay, and thousands in unnecessary depreciation.

During the Agricultural Survey work conducted by the Lands Committee in 1913, some interesting facts in this connection were revealed. A farmer near Moosomin, Sask., who, after twelve years, was giving up farming, held an auction sale. His binder brought $80 and his other machinery sold proportionately high. It had all been well housed each year and the necessary repairing and painting had been done. On a neighboring farm a binder which had been used for only three years, but left out of doors and neglected during that time, went to the scrap heap and a new one was purchased. Conditions similar to the latter obtain over the whole of Canada, but more frequently in Western Canada. An implement house costs money, but if the depreciation on housed and well-cared-for machinery is only one-third or less of that on machinery left out of doors, it is good business to put a roof over the implements.—F. C. N.

A Good Road in Compton County, Que.

The above illustration shows what can be accomplished by men who always find time for improvements, even on the roads which adjoin or

pass their premises. Once the road is put in good order it takes but little time to keep it up. The split-log drag is kept in a convenient place, and at such times as is found necessary is run over the road, filling up ruts or any depressions. Each farmer takes his turn with the drag. Should extra labour be required it is mutually agreed upon.

If more farmers would be as public spirited there would be better roads and the cost and time to the farmer would scarcely be missed, and much good would be accomplished.

HORTICULTURE.

"I Guess It Will Do."

Within the past week a farmer came to me about spraying his apple trees, saying, "I have been over those which promise a fair bloom and I guess it will do."

Asked as to the relative importance of spraying the non-bearing trees to insure protection for next year, and his reply was, "Yes, I suppose I ought to go over them all, but I guess it will do."

How many of us take this position in our work; not alone in spraying fruit trees, but also in our general field of operations? When we escape direct calamity, it is counted clear gain; when bad results follow gradually, we content ourselves with the thought that "perhaps bad luck would come, anyway," and "it is no use to expect to get cream every day."

Apply guesswork to manufacturing and mills would be ruined, to machine shops and engines would not run, to banking and business would be at a standstill. Is farm work an exception? I remember the orchardist who, having sprayed thoroughly for several years, allowed a public demonstrator to experiment one season. In this experimental work a check plat was necessary, so, through the orchard, two rows of trees, fourteen to a row were left without spraying, the result being little fruit of those twenty-eight trees that year and not a normal crop for three years after. Failing to protect that one year, the injury by pests and diseaes prevented wood growth and bud development as indicated. You cannot caunt results by years. Things lap over and what we do today must be done not with an eye single to the crop of this year, but with the desire to open the way for better things next year and thereafter. If anyone should express thanks over the coming of the dreaded San Jose scale, he would be thought fit only for a straight jacket and close confinement in an insane asylum, yet it is a fact thas, in other New England States, the appearance of this deadly pest has resulted in the production of better fruit than ever was grown before. Spraying for the destruction of this scale has cleaned up orchards and protected trees. The heavy losses reported, of those orchards being wiped out by this pest, only tells of those who "guess it will do," and neglected the dormant spray. There's a right time to do everything, and if so, there must also be a wrong time, and the wrong time to spray for codling moth is before the blossoms open and petals drop, just as the wrong time to spray for the curly-leafed aphis or scab fungus is when we spray for protection against the codling moth. When will men learn that things must be done at the right time? The coming of the potato bug and the blight spore has been a blessing to every potato grower who sprays at the right time and with the right preparations. Those who spray to kill the bugs and "guess that will do," wake too often to find that the profits have gone in rotten potatoes. The only safe rule to follow with potatoes or apple trees is to spray, at the right time and with the right combinations, just as though certain there will be an infestation by every pest and the coming of every disease known.

There is no cure for injury inflicted, and our only salvation lies in complete protection. The man who waits until the potato slugs begin to eat before getting his sprayer started has, by negligence, invited loss. So it is with blight, or scale, or aphis, or codling moth. Never has Central Maine been threatened as this year with damage by the tent caperpillar, yet men will be found in every community who "guess they won't do much harm." When the leaves are stripped from the trees and the danage done, such men will be the first to talk about a dispensation of Providence.

There are difficulties in the path of the worker of 1913 not realized, if met, twenty-five years ago, but the recognition has brought also knowledge of means of protection, and there is no excuse for neglect.

Everywhere results are minimized simply because of failure to apply the simple means of protection. It costs 5 to 6 cents per tree for the dormant spray of lime-sulphur, before the buds of leaves start. It costs 5 cents per tree for the second spraying, when the buds are red, for the destruction of aphids and protection from scab, and 5½ cents for the third, after petals fall. This class of work will also destroy the San Jose Scale.

Now let us see, here is an expense of 16 cents per tree, large tree, figuring labor at $2 per day and horse at $1, but not allowing for wear and tear of sprayer. One-half cent will cover this, so that the total would be 16 cents for the year's work, spraying the apple trees. Is this burdesome? In view of the protection insured, the greatly increased per cent. of No. 1 apples sure to follow, it is the best investment the owner of an orchard can make. It means health and vigor to the trees, it means larger and better apples, it means practical freedom from worms and defects, but there's no chance for guesswork here. Whatever is done must be done thoroughly and this what pays everywhere.

Winter Protection of Young Apple Trees

Editor Maritime Farmer:—

Precautions must be taken to prevent injury from mice, rabbits, etc. Many failures in apple growing here and elsewhere are caused by these pests and a large annual toll in the form of dead trees is annually exacted by them. As far as possible crops harboring and attracting such pests should be avoided and the accumulation of litter, trash, weeds, long grass, etc., which furnish suitable winter quarters for these animals, prevented. Mice work under the snow and damage from them may be prevented by tramping the snow solid around the tree after the first few snowfalls. This method of protecting is, however, somewhat dependent on the weather. The cheapest and safest protection is secured by wrapping the trunks cylinder fashion with paper, wood veneer or some such material. Good strong building paper, as light as possible in color gives satisfaction. This may be placed round the trees in the fall, not tightly, but leaving an inch or so of space between the inside of the paper and the bark of the tree. The soil should then be mounded up around the bottom of the paper to a height of six inches or so. Veneer tree protectors, made of thin material, one-eighth inch thick, 12 inches wide, and costing about ½ cent each will last two and three years and afford good protection. The paper or veneer as the case may be should be removed in the spring, about the middle of April.

SUN SCALD.

This form of damage is very common is some localities, so common, in fact, that a tree which escapes it is a rarity. The greater part of the damage occurs in late winter, or during the warm spring days when the snow is going off. During the warm afternoons the sun, reflected from the snow against the south-west side of the tree trunks, becomes very warm. The trunks are thoroughly warmed on that side. They are thawed out, and the bark becomes soft, sappy and pliable. Then, when the sun goes down the temperature falls again to zero, the bark is again frozen tight. The next day the same thing happens and so day after day the young bark freezes and thaws, and by this means is torn to shreds. When spring arrives the bark is killed and broken open. The various kinds of fungi get in and the damage which begins by freezing and thawing ends with the spread of canker and other troubles all round the trunk of the tree. The best preventatives of sun scald are low heads and veneer and paper cylinder protectors. High-headed trees, which are of doubtful value anywhere are altogether undesirable in places where sun scald is bad. The protectors of paper or wood veneer recommend above for mice and rabbits will also give practical immunity from sun scald. This trouble is a very serious one. It is not uncommon to find entire young orchards ruined by it. In sections where this trouble is prevalent great pains should be taken to protect young orchards from it. For the benefit of the fruit growers, the Fruit Growers' Association has secured about 3.000 veneers and will fill orders for them at cost price. Apply to: The Secretary, N. B. Fruit Growers' Association, Fredericton.

Fire Blight of Apple Threatened.

At a recent Massachusetts fruit meeting Mr. Kinney, from the Pacific coast, spoke about fire blight of apples, telling what a serious matter it has become in the west. He also intimates that fire blight in New England. What are the facts? Is it anything like the pear blight.—A subscriber.

The fire blight of the pear and apple is the same, but in the past has given apple growers in New England little troible. Concerning this matter Prof. A. G. Gulley, of the Connecticut station has the following to sat: "While fire blight on the apple is identical as to disease, it is not as to results. I understand there is an epidemic of the disease from Lake Michigan east, far more serious than for some years past. Two years ago I saw if for the first time in the east

News to most women!

Oven-tested flour is for sale. Instead of buying ordinary flour you can buy flour whose baking ability has been proven in an oven:

A ten pound sample is taken from each shipment of wheat at the mill. This is ground into flour. The flour is baked into bread.

If this flour bakes into bread high in quality and large in quantity we keep the whole shipment of wheat and grind it. Otherwise we sell it.

More bread and better bread from this flour is a certainty!

One Cent a Word Ads.

Two letters last week from one cent a word advertisers, express to the Maritime Farmer their appreciation of the gratifying results following their investments. In each case tne amount invested was trivial. But it brought profits in the way of increased prices for articles offered for sale that surprised the advertisers. While one cent a word ads. are cheap, they are wonderful little messengers. They work while you work, or while you sleep for that matter, telling your story to thousands of Maritime Farmer readers. They never remain idle for a second; so when you want to sell something or buy something or do a hundred and one other things you want the public to know about, mail your one cent a word ad. to the Maritime Farmer, Sussex. As has been observed before the results will surprise you and the profits amaze you. In like manner if you want to get something, read the little ads. They may discover for you just what you have been looking for. Cash must accompany all ads. No ad. less than 25 cents.

in a young apple orchard. Now it is very common in Connecticut. It is not quite so bad on the apple as on the pear, since it does not always kill the tree, even if not removed.

"The remedy is to remove the disease, that is, cut it out of the tree. cutting well below any evidence of the trouble, no matter how much of the tree is removed. This will usually stop it in the apple, and often does so in the pear tree. However, cutting back of the pear does not stop it this season. The college has removed nearly a dozen large trees this year, some of which were nearly killed from the start. My hope is that the present serious outbreak may not run long. I regard the appearance of fire blight on the apple in the east as much more serious than being found on the pear, this at least, in Connecticut."

For the benefit of readers not familiar with the disease, it may be said it is easily recognized by the brown, dead leaves clinging to the dying branches, giving the appearance of having been scorched by fire, whence comes the name. Sometimes only a single branch or small twig is blighted, and in other cases the whole tree. It is a bacterial disease, and the minute organisms multiply rapidly, germs passing the winter in the growing bark layer of the twig. Later these germs may ooze out through a break in the bark along with the juices of the tree. The disease is favored by abundant moisture, and there are three points of attack; the flower, the opening leaf bud, and exposed portions of tissue upon the branches. In the case of the apples, the most common source of attack is through the blossom, according to J. J. Thomas, of New York.

The Maple Sugar Industry.

It may surprise many to learn that the maple sugar and syrup crop in Canada is worth about two million dollars per year. In the Province of Quebec, the industry has maintained a strong foothold, more especially in those countries that contain more or less rough and rocky land. In Ontario it also bulks large, and in New Brunswick and Nova Scotia considerable quantities of sugar and syrup are made each spring.

During recent years the industry has shown signs of decline, and in order to encourage the improvement the Hon. Martin Burrell, Minister of Agriculture, has authorized the preparation of a bulletin which should give it considerable support.

One cause of the decline is given as the poor quality of much of the goods made. On the authority of extensive dealers it is estimated that fully six ty per cent. of maple products do not grade above No. 4, and that this vast amount has to be sold for not more than half the price per pound of No. 1 goods, of which about 10 per cent. is made. On this account it is pointed out in the bulletin that makers are losing each year on quality alone, fully one million dollars.

The bulletin goes fully into the subject of syrup and sugar making, describing clearly the necessary equipment and its operation, and gives useful information on marketing. An interesting section describes the making of maple vinegar and the collection and preparation of sugar sand which constitute two valuable by-products of sugar making.

The work, which is from the pen of Mr. J. B. Spencer, B. S. A., Editor of the Publications Branch, is gotten up in very attractive form, containing very beautiful illustrations portraying sugar making scenes, ancient and modern. To show the appearance if sugar and syrup of different grades, plates of samples of each are presented in natural colors. This work, which is designated "The Sugar Making Industry in Canada," will be sent free to those who apply for it to the Publications Branch of the Department of Agriculture at Ottawa.

Look Here Sir!

If you can get a Suit valued at $25.00 in Canada for $12.50 from Catesbys in London--Will you buy it?

We undertake to prove to you that you can—if you buy from us.

You've heard that clothing is cheaper and better in London. You know, also, that you can't beat the quality of the genuine English fabrics.

When, therefore, we guarantee to sell you a suit made of fine English cloth, cut in the best Canadian, New York or London style (as you prefer), laid down at your door, all duty and carriage charges prepaid, for a price about one-half of what you would have to pay in Canada, isn't that worth looking into? Of course, it is.

Then sit right down now, fill out the coupon below, mail it to our Toronto office, and get our latest Style Book and patterns. With this book is a letter explaining our system of doing business and a self-measurement form which is so simple that you can't go wrong in using it, We'll also send testimonials from a hundred satisfied Canadians who regularly buy from us.

Get these Patterns now and be convinced

If you don't want to cut this paper, write a postal o letter, and we'll send the patterns anyway, but to get them you must mention Sussex Maritime Farmer.

"The Burlington"

This shows the most popular style of suit worn by well dressed men in Canada. The materials used are specially selected for this shape of suit.

DAIRYING.

Accidents to Dairy Cows.

The old saying is that accidents will happen in the best of regulated families, and I think this old adage will prove true when applied to dairy ing. Accidents will happen in the best managed dairies, at least, accidents keep happening in my dairy, not every day, but occasionly. Not more than two months ago a cow came up at night from the pasture with her hip capped; that is, the cap at the end of the hip bone was knocked off. Of course cows recover from this after awhile, but she was lame for two or three weeks so we couldnt let her run with the herd. She finanland now limps but little She finally got better and now limps but little.

But it damaged her. We had her in the test for the register of merit and the accident caused her to shrink so in milk that she is entirely out of it for this period of lactation. There is no particular plade to lay the blame, it was simply au unavoidable accident, and we will have to suffer the consequences.

Another good cow got her teat injured. It looks as if she stepped on it in getting up, but how she did it is more than I can see. On one side of the teat the hide is all scraped off and it extends over the end of the teat so that the scab pratically closes up the opening. It is a very sore thing. You have to take the scrap off from the end of the teat every time you milk, and the cow resents it. You can't blame her. She doesn't know any better. It is getting better now, but the cow in this condition will not give a normal flow of milk. She is a fresh cow and may practically recover from it, and yet I doubt it. Any little thing like this in the beginning of the period of lactation simply gets the cow out of sorts and she doesn't do as well as she would if the accident had not happened. I wish I knew how to prevent all of those accidents, but I haven't learned yet, and I doubt if I ever will, or anybody.—Colon C.

Milking Time.

Although considerable storied romance hangs about the evening hour of milking, there is a practical side to it which should be recognized by every dairyman. In these days of a multiplicity of statues, many states have promulgated laws for the guidance of milk producers, while large creamery owners and milk companies have added rule to rule in their efforts to satisfy the public as to cleanliness and sanitation. All these things should open the eyes of the farmer to the necessity of exercising the greatest care at milking time.

In the first place the pails used for milking should be thoroughly clean. This does not mean cleaning with cold water but scalding and re-scalding and then an exposure to the effects of air and sunshine. I like the partially covered pail best, as the covering keeps out a good many particles of dirt and rust, but of course more work is required to keep it clean.

A great many do not recognize the necessity of approaching the cows with gentleness. I have seen a cow that would not give more than half the usual mess if milked by a stranger. There are some cows of such a nervous temperament that the greatest care is always necessary. A harsh word would practically stop the flow of milk. While this is not true to the same extent in all cows, yet it is well to remember that steady, careful handling of the herds will increase the flow of milk while arbitrary methods will cause a decrease.

If a cow is inclined to be restless at milking, gentleness will almost always prove more effective than the kick of a number ten boot—which so many hired men and even owners of herds, themselves, often resort to. If a cow kicks she can often be cured of the habit by tying her close to a partition. Then crowd her close to the side when sitting down to milk. In this position she cannot use her feet with much effect, and unless she is too badly confirmed in the habit, she will soon submit to the inevitable.

Ropy Milk.

When milk becomes ropy or slimy eight to twenty-four hours after it is drawn, the difficulty is caused by bacteria getting into the milk and is not due to unhealthy cows. The trouble may orginate from cows standing or passing through mud holes.

Where difficulty is experienced with ropy milk everything with which the milk comes in contact has become infected and the remedy is to sterilize all pails, strainers, cans, separator and everything with which persisted in far several days the the milk comes in contact. The cow's udders and the milker's hands should also be carefully washed before milking. If this treatment is thoroughly trouble will usually disappear.—W. J.

The Dangerous Pitchfork.

Have a place to hang up the pitchforks, or make a rack to lay them on. They are dangerous anywhere else.

Carrying the pitch-fork up the ladder into the hay-mow or bringing one down, is a dangerous operation, considering that a person might fall, or the ladder slip.

Throwing the fork down before descending the ladder from the mow is another foolish trick; attempting to toss it into the mow is still more dangerous.

We simply keep one fork in the haymow and one below, around the stalls, mangers, etc., which does not necessitate carrying one up or one down the ladder during the feed-hour.

Handled carefully there is little danger of thepitch-fork injuring anything, but if thrown around and menace to the life and limb of every handled carelessly, it is a constant living thing on the farm.

We rarely lay a pitch-fork down anywhere on the ground. Most painful and serious losses caused by such carelessness are very frequent. It takes but a moment to hang the fork up after using it, and the habit not only avoids the above named dangers, but one always knows right where to find the fork when it is needed.

We have known a fork left sticking in a pile of hay "just for a minute" to painfully, wound some of the stock. A fork stuck in the side of a straw or hay-stack looks safe enough, but a nearly getting killed by sliding down young man friend of ours came very on just such a fork last summer, and we have heard of different cases where men have been instantly killed in this manner.

Withall our careful handling of the pitch-fork we have very narrowly averted several serious accidents with it. One common error made by many is that of putting hay in the mangers while a horse or cow is eating, especially after dark, when one has no lantern. The animal, being touched on the nose or about the head with the fork-tines, suddenly jerks its head and thus it is apt to sink the fork still deeper into its flesh, perhaps putting out an eye. The excitement and

sudden movement of the animal also causes a dangerous mix-up of man, beast and pitch-fork, which is liable to result in serious injury for all.

We have received painful bruises and slight wounds which easily could have been much more painful and dangerous, by careless handling of a pitch-fork around the horse and dairy stalls, in cleaning out manure, passing between the stock and partitions, etc. Ever so slight a touch of the keen tines of the fork causes the animal to jump and kick. This often results in the fork sticking into the flesh of the animal, causing still more kicking and struggling, thus endangering the very life of the animal and its attendant, as we have known the fork to enter the flesh so far in such instances that it required great effort to remove it.—M. C.

The Dry Cow.

There is no class of people in this country who pay heavier for their mistakes than the farmer, and the dairy farmers heaviest of all. It is true misfortunes will happen on the best of managed farms, but the man who brings a certain amount of forethought and sound judgment to bear on his business is bound to come out better than the man who trusts to luck. Among all the animals on the average farm the dry cow, as a rule, gets the least attention, and milk-selling farmers with a contract running for a fixed quantity daily are the worst sinners in this respect. Heavy in-calf cows that ought to be dry are often forced by the feeding of large quantities of concentrated foods to prolong their milking period unduly, while the owner is anxiously waiting for other cows to calve down to take their place. Then when the long expected happens the poor stripping cow is hastily and very often imperfectly dried off, and either turned on to a pasture with not enough on it to keep a rabbit, or in winter time is put on the worst hay of the place, and it often happens that cows so treated, and that are often in high condition when turned out, get very poor by the time they calve again.

Well, after years of experience among dairy cattle, I have come to the conclusion that the manner in which the stripping and dry cows of a dairy herd are managed makes or mars, to a far greater extent than the average farmer thinks, the success of that hard at the milk-pail during the ensuing season, and I will go farther and maintain that from 25 to 50 per cent. of the various losses and accidents incidental to dairy farming are the direct results of bad management with the in-calf cow. I will give a case to prove my ascertion. About twelve years ago a young man took a capital dairy farm in this district of about 200 acres. He was the son of a tradesman, and was over twenty when he started to learn farming. However, he reckoned he new more about farming than most of his neighbors, and was not an easy man to proffer advice to. He kept a dairy herd of about forty-five cows, and weaned ten or twelve calves each year. He was very keen on the production of milk, which he sold. He would keep his cows well as long as they gave a drop of milk, letting them lie in at night and coddling them all the ways to get a quart of extra milk out of them. Judging by my own experience, some of his milk must have cost him half-a-crown per gallon. I have seen him year after year turn out those cows as they became dry in the middle of winter, utterly regardless of the fact that they had been lying in by night for a couple of months or so. They were generally in good condition when turned out, but with only a bit of rough hay and missing the shelter they would fairly melt. Some of them would abort their calves, some would go screws, others had bad udders, and they were all more or less chilled. The calves he weaned from them were chilled before they were born, and half of them generally died before they were a year old. He kept the farm for about ten years, and during the last half-a-dozen years of his tenancy I do not think he sold as many beasts, except screws at about 30s. each. He finished up with the rottenest lot of cattle I ever saw together in my life. He left the farm cursing it and all belonging to it, and complaining bitterly of his bad luck. He certainly paid more dearly for his mistakes than some people. His successor is doing very well on the same farm. It is the alternate fattening and starving that plays havoc with the in-calf dairy cow, and, worse than all, the alternate lying in and out. If you can't keep cows in right through let them stay out altogether—they won't hurt with plenty of food and good shelter. There are thousands of dairy cows wintered out in the district every year, and where they are wintered on sound dryland, with plenty of sheltering hedges and easy access to water, and not too many in a lot, they do very well, especially if they have 2 or 3 lbs. of cake per head daily on towards calving time. I would rather winter them out altogether than house them day and night. Although cows so housed will get in good condition, neither they nor their calves when born are nearly so healthy as the cows wintered out.—Farm and Home, England.

Fast Work Cutting Ensilage

You are a very busy man. Every minute of your time is valuable—is worth money to you. For instance, the time you would save by cutting ensilage with a Renfrew Standard gasoline engine you could put to advantage on some other task. Yet cutting ensilage is only one of the numerous ways in which a Renfrew Standard engine saves precious time and labor for the busy farmer.

Renfrew Standard
It starts without cranking

Does All These Things

A Renfrew Standard gasoline engine would furnish you with power for sawing all your wood, cutting your fence posts, turning handles, running the grindstone and the emery wheel.

It would drive your thresher, grain elevator, straw cutter, fanning mill and hay press. Some people even use the Renfrew Standard for running the sausage grinder, green-bone cutter, separator, washing machine, while on other farms it is used to pump water and run electric lighting plants for house and barn.

We have letters by the score from farmers telling us that they wouldn't know how to get along now without a Renfrew Standard engine. They say, too, that they are sure there is no other gasoline engine so efficient as the Renfrew Standard.

Certainly there is no engine that starts so easily; for the Renfrew Standard starts without cranking in all kinds of weather, hot or cold, fair or rainy.

And where else will you find an engine that runs so smoothly, and is so perfectly balanced, that it does not "creep"—does not need to be anchored down? Where is there another engine that has no pipes, fittings, cooling pumps or fans to leak, freeze or get out of order? Where another engine so simplified, so free from complications, so easy to understand?

The Renfrew Standard is the kind of gasoline engine you want and need. And if you will tell us the size of your farm and general requirements we will give you the value of the knowledge of our experts in choosing the size of engine. But be sure and write for our free booklet and circulars. Do so today—Now.

Compare the "BISSELL" with other disks

Thousands of Farmers have tested the "Bissell" Disk Harrow in the same field with other makes and found that the "Bissell" HAS THE GREATEST CAPACITY.

The plates are the correct shape. They cut, turn and pulverize the soil where others only scrape the ground and set it on edge.

The "Bissell" Scrapers meet the plates chisel fashion and keep the plates clean. Movable Clod Irons—an exclusive feature—keep the space between the plates clear.

The "Bissell" stays RIGHT DOWN TO ITS WORK. It won't bind, buckle or hump in the centre no matter how stiff or hard the soil may be. It is built to stand hard usage. The simple method of balancing the driver's weight removes neck weight. It is the Harrow you should know more about.

LIVE STOCK.

Sore Mouths in Pigs.

There are two kinds of sore mouth in young pigs. One kind is caused by the little pigs cutting each other with their sharp tusks. This kind is not very serious, but it often turns into the Infectious sore mouth, which is very dangerous, since it spreads from pig to pig and may kill a fourth to a half of the litter.

I suggest that all breeders read very carefully concerning this form of sore mouth trouble in pigs. The cause of it is a germ which is found everywhere in dirty bedding and damp, wet yards, and around manure piles. In rooting in dirty yards or pens, or in sucking the sow's udder, it is very easy for pigs to get these sore mouth germs in their mouths. If the mouths have already been cut because of teething or fighting with other pigs, trouble will start at once. The sore spots in the mouths will become larger and larger, then they will become ulcers and the flesh will fall away. About this time the pig becomes very dull and stupid and refuses to suck any more. In three to ten days he generally dies, or if he recovers will never be much good.

In treating pigs for sore mouth, the first thing I would do would be to separate all the sick litters from the well ones. Then I would dissolve two ounces of potassium permanganate or two ounces of good coal tar dip in a gallon of warm water. I would put this in a pail or tub and stick each effected pigs head into it, taking care of course not to leave any animal in long enough to drown. Do this once or twice a day for five days. At the same time wash the sow's udder off with some of the disinfectant. It will also help to take a syringe and wash out each pig's mouth thoroughly with one of the two solutions twice daily. If the sores seem to have any dead matter on them, scrape it away and touch them with lunar caustic.

What is all this for? By all this we are simply trying to kill the germs that cause the trouble. Both the coal tar dip and the potassium permanganate solutions are death to germs. By sticking the pigs' heads in one of these solutions, we kill the germs that are sticking about the heads, and also kill a lot of those which may be in the mouth. By syringing the pigs' mouths, we kill more of them, and by washing off the sow's udder we kill those germs wnich may be sticking there ready to get into the mouths of the little pigs. If any sores appear on the nose or face, put on an ointment which is made by mixing one-half ounce of iodine and eight ounces of vaseline.

Sore mouth can generally be prevented by keeping the pens and yards as clean as possible and disinfecting them with coal tar and whitewash. But even then sore mouth occasionally breaks out, and it will be necessary to stop the spread of the disease by coal tar dip solution or some other germ killer. It is always a good plan to break the sharp little teeth of young pigs off close tot he gums so as avoid the simple kind of sore mouth which may become the serious sort.—Wallaces' Farmer.

Corns on Horses' Feet.

This expression is applied to nearly all bruises of the rear half of the blood vessels from injury (pressure from an improperly fitted shoe, or permitting the shoe to rem in on for more than five weeks). Corns are apparent to the eye as yellowish, reddish, or bluish discoloration of the horn of the sole and white line. The horn tubes are penetrated by blood from the ruptured blood vessel. The discoloration may be so slight that if the foot be improperly pared, the corn may be entirely overlooked. We have corns on the wall, sole and bars. Corns affect principally the inner half of the hoof, and the fore feet are almost exclusively the seat. There are two reasons for this:

First, because the fore feet support the greater part of the body weight.

Secondly, because the heel of the fore foot is first placed upon the ground during progress, thus receiving much more concussion than the heels of the hind feet.

1. Dry Corns. This corn is dry and seldom causes lameness.

2. Suppurating corns. Considerable pus is formed, causing severe lameiness.

3. Chronic Corns. This corn is either soft, moist or lardy and there is an intermittent lameness aggravated by improper shoeing.

Some feet are predisposed to corns, viz., narrow, deformed hoofs, deformity of the limbs, badly trimmed, wide flat feet, excessively weakening the sole bars and frog, permitting the toe to grow to long, shortening one-quarter too much, so that the foot is unbalanced, shoeing a heavy horse with to light a shoe, thus permitting the shoe to spring down on the heel. Permitting the feet to become to dry and brittle, thus reducing the elastic properties of the horn. Nailing the shoe to far back, thus preventing the natural spread of the hoof, when placed upon the ground. Applying the shoe to hot when being fitted. Insufficient concavity of the shoe in flat feet. Horses which have never been shod rarely have corns, thus proving that corns are due to errors in shoeing.

TREATMENT.

First, removal of the cause by paring the hoof to the proper angle; shorten the toe and cut down the quarters if too high. Put on a level shoe. If calks must be used, use both toe and heel calks, never toe without heel, nor heel calks without toe, unless for a special purpose. A leather sole should always be used under the shoe, and place a dressing over the sole of the following mixture: Pine tar, 8 ounces; Venice turpentine, 1 ounce; spirits camphor, 1 ounce; compound tincture benzoin, 2 ounces. Mix and smear plentifully over the sole, after which apply oakum and the leather pad.

When there is a suppurating corn, the shoe should be left off for several days, and drainage for the pus established. Poultices of flaxseed should be applied, in which has been placed about two ounces of creoline. When the lameness has been removed, the horse should be carefully shod, using a bar shoe with a leather sole, and the above dressing. The after-care of the hoof consists in keeping it cool, moderately moist and pliant.

Red Water of Cattle.

The disease is characterised by great prostration and general debility of the bodily powers, with which the urine assumes a redness of more or less intensity. For some time it was the opinion that the kidneys were the organs peculiarly at fault. As a result of certain causes, the liver is the structure that is primarily disorganised. The immediate causes of the disease of red water among cattle may be found in the food the animal attacked is fed upon. Stall-fed cattle are scarcely ever affected, unless a large quantity of turnips grown on very poor soil, or a deal of undecorticated cotton cake constitutes a big

share of their diet. Decidedly the majority of cases originate from putting cattle on grass on badly drained, impoverished meadows in the spring, and contains but little or no nutriment; or during the autumn when it when the herbage is extremely watery is coarse and indigestible, and mingled with dead leaves. In hot summers, also, and when all good vegetation is scorched up, the disease may make its appearance in the herd.

SYMPTOMS.

Perhaps, in a general way the most noticeable symptoms are a yellowness of all the visible mucous membranes of the body, with an undue looseness of the bowels, and in some cases marked diarrhoea. Both these indicate the primary disturbance of the liver. The animal is off its appetite, and ails in this way for a day or so, when fever sets in, gradually becoming greater in degree, accompanied by an obstinate constipation; thirst, and suspension of rumination. In a milch cow the secretion of milk goes off very rapidly. The urine is passed very frequently, at the onset being scarcely tinged, then the stain becomes more marked, and, finally, the redness may be of such intensity that the disease receives the name of black water. Emanciation becomes extremely marked, owing to the impaired state of the blood, and the patient appears to be dying from starvation. The pulse is feeble, the heart's action jerky and audible, the respiration short, quick, painful, and accompanied by a moan. The horns legs, and ears generally cold throughout the attack. The duration of the disease in acute cases is from three to five days, which will either carry the patient off, or bring about a favorable change in its conditikn. Some cases after the animal rallies assume a chronic form, but only for the patient to become worn out, and finally die in a week or so in an extremely emaciated condition.

If one makes a post-mortem examination of the carcase no trace of inflammation will be discernible in any of the structures of the body. Frequently the lungs are watery and slightly congested, and the same may be said of the kidneys. All the organs will be much emaciated, almost bloodless, similiar to those of an animal which has been bled to death. The liver is enlarged and softened, and all the tissues present a more or less yellowish cast.

TREATMENT.

Bearing in mind that great debility is present, and the essential blood constituents incapable of performing their functions, it can be readily seen that neither purgative treatment, nor bleeding—another favorite remedy—is necessary. The animal must be got into a comfortable shed, and made as warm as possible, clothing the body and bandaging the legs being good aids to keeping up the general circulation. When obstinate constipation is present, give a pint of linseed oil or a small dose of Epsom salts, and if the patient is very week, stimulants may be usefully employed; tincture of gentian and ginger in combination with perchloride of iron. The animal must be well nursed and drenched frequently with linseed or oatmeal gruel, the food of the best quality, varied and rendered as appetising as possible. Green meat should be withheld until the strenght is well restored. The stimulant and tonic medicine may be continued for some length of time, and as the animal picks up, a little common salt, nitre, or bicarbonate of potash given in dry food will prove beneficial. It must be added that when recovery takes place there must be a complete change of management, and anything at all of a character likely to bring on recurrence of the malady particularly avoided.

1000 Apple Trees Fully Equipped Farm $3900.

250-acre farm in noted farming and educational section; 2000 cds. wood selling in village for $6 per cd. ; 100,000 ft. valuable timber; 45 acres rich tillage; spring-fed pasture for 50 cows; fine 10-room house; 2 good barns, one 38x65; carriage, ice and poultry houses; if taken now you get 4 choice cows, good horse, full line farm machinery and crops thrown in by woman owner unable to manage, part cash; write for details and traveling instructions to see this and a good stock and fruit farm equipped for only $1700d Box 373, Sussex, N. THE HORSE.

Horse Breeding Test.

Investigqtion has shown that there is a certain loss in weight of horses during work, allowance being made for the fodder consumed. Farm horses lost on an average of 7.7 pounds in weight during eleven hours. A division of German army horses ridden 25 minutes lost 4 pounds in weight. One gelding carrying 176 pounds in training as a school horse lost 11 pounds in 25 minutes anh regained but 1 pound of the lost in 24 hours. A blind stallion carrying 166 pounds was ridden one hour and thirty minutes and lost 33 pounds.

On a test of 876 horses fed on a ration of bran and shorts and 792 horses fed on a ration of oats on a daily service of seven hours' work, it was demonstrated that the former was of equal value with the latter. The horsefed the bran and shorts ration performed three and one-half more hours per week than the lot fed on oats, but the former lost in weight while the latter made an average gain of 10 pounds.

The Paris Omnibus Company, employing nearly 10,000 horses, changed the rations gradually from 18.7 pounds of oats and 1.8 pounds of bran to a corn ration. One month was consumed in the transition and at the end of four months the horses had made an average gain of 25 pounds but were less spirited and ambitious to perform their work. In an experiment by the London Omnibus Company it was found that a corn ration was superior to oats to fatten horses, but the nervous force decreased and the mortality among the horses increased. It was developed that a mixture of 12 pkunds of oats and 6.6 of corn made an economical ration for horses performing fast work in the omnibus service of Paris.

The Hoof

In discussing this subject from experience, observation and conjecture, let me state that I can only hope to give a few fundamental facts, but which to every horse owner are of great importance. The importance of the condition of the hoof cannot be over-estimated; especially are good feet necessary to the horse, for, adds a writer in the Farm, Stock and Home, to whom we are indebted for this article, his value is lessened according to the degree his work is interferred with. While other animals are not used for pulling purposes, yet they should have good feet, so that they may get to the feed trough and pasture, those that are kept for breeding purposes as well as those who are to haul a big load to the market.

The hoof is divided into three different parts—the wall, the sole and the frog. The wall is the part seen when the foot is flat on the ground, and is divided into the toe, the quarters, the heel and the bar. The toe is the front part of the wall (hoof) and is the toughest part of the wall. We find the quarters situated at the side of the hoof. The walls here are not as thick as at the toe, and are nearly straight up and down. At the back part we find the heel, a process of hoof; it looks like a bar; this bar acts as a brace to the quarter. The outer surface of the wall is rounded and covered by a protector, which is called the peroplic band. This can be best seen when a horse's hoof has been well washed off, as it is after it has travelled in wet grass or crossed some water, when the hoof has a shining appearance. The membrane is to keep the moisture in the hoof and to protect it from water.

All parts of the hoof grow downward and forward with equal rapidity the rate they grow being largely dependent upon the amount of blood supplied to the pododerm (quick). They grow faster when the horse is not shod. When given no exercise, dryness of the horn and too great a length of the hoof hinder the proper growth.

A perfect hoof is a product of breeding, and with this must follow a rich protein ration, because the hoof is nitrogenous in composition. Corn is unfavorable for the production of a hard, tough and dense growing hoof; I say this from my own personal experience; and for this reason corn alone should never be fed to a growing colt. If this advice was followed, accompanied by exercise and proper trimming of the colt's feet, we would not see so many poor, deformed horses' feet. I would give them plenty of good feed, and at the proper time remove the overgrowth of hoof, regulating the bearing surfaces by increasing the volume and improving the flow and quantity of the blood flowing to the pododerm. This will favor a rapid growth of horn of good quality. Irregular hoof is not infrequent, and is caused by the improper distribution of the body weight over the hoof; this we call an unbalanced foot. If by ignorance one side wall is cut shorter than the other, and that mistake is repeated again and again, the result will be a crooked foot. Colts standing in the stable too much cannot wear down their hoofs, and at least every two months let them stand on a platform or a level barn floor for treatment, and

Horsemen Attention!

Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. when you are through rasping the walls back you can tell if you have done a good job or not. Never use anything but a rasp and a pair of pinchers to cut and trim back a hoof. The lower edges of the wall should be well rounded to prevent chipping. The hoofs that are becoming crooked should have the wall shortened in such a manner as to straighten the the foot axis.

In regard to shoeing, I look upon shoeing as an evil from a physiological view-point. And yet it is a necessity in many ways. The hoof never rests in a healthy animal; at the toe it takes 11 to 12 months to grow down from the coronary band to ground at the quarters 6 to 8 months, and at the heel 3 to 5. This shows that we must not let the shoes stay on very long at a time before resetting them. In trimming the foot for the shoe the frog must not be touched further than to cut away the loose tags or layers that are too loose to form a protection. The frog should extend below the walls about the thickness of a common shoe. The shoe should always cover the entire bearing surface of the wall.

Breeding

Mares usually come in season and may be bred on the eighth or ninth day after the foal is dropped. If they fail to respond at this time they may be tried on the 27th or 28th day from time of foaling. Mares that are in strong vigorous condition seldom, if ever, refuse service at one or other of these periods. The development of the foetus is very slow until about the sixth month, so that by weaning the suckling foal at the end of the fifth month the task of the dam is reduced. For the first five months she works and nurses her foal; for the next six months she works and builds up the foetus. It is important to know that the chief growth of the foetus occurs during the sixth, seventh and eighth months of pregnancy. The growth during the last three months is comparatively slight, so that from the standpoint of bone and muscle building required in building up the foetus, the mare needs more care from the sixth to the eighth month inclusive. It is therefore wise policy to supply an abundance of nourishing bone and muscle building food during the months when the most active development of the foetus is taking place, and to lighten the work to a reasonable extent if it be possible to do so.

Breeding Age

As a general rule it is not wise to breed mares until they are about three years of age, as early breeding tends to stunt the growth of the animal. In the case of very large, strong draft fillies that will weigh 1,400 lbs. at two years of age, there is no objection to breeding, providing special care is taken to feed more liberally than usual. Breed large draft fillies seems to broaden them out, and if they are permitted to skip breeding the following year, they will be fully as heavy at five years as the mares that were not bred until three years of age. This plan often gives advantageous results in fillies that are overgrown, awkward and lacking in good proportions.

Horse Notes

Early education for the colt, nothing like it.

After all, what good ever came from shouting and swearing at the horses?

SPECIAL ADVICE FOR MEN Strength Restored By New Method

MANLY MEN ARE THE WORLD'S POWER TO-DAY

The little book described below (which I gladly send free, sealed, by mail, to any young or elderly man anywhere) contains in its 85 beautifully illustrated pages everything a man need know with regard to certain strictly personal subjects, and as a guide through his entire life, from the delicate period of youth, when wholesome advice is most needed, on through early manhood to a ripe, vigorous, healthy old age. Over a million of these books have been thus distributed by me all over the world. Therefore, please use coupon below and get YOUR free copy by return mail. SANDEN CO., DISTRIBUTORS.

Do you know, my friend, that there is a wonderful new way to apply a certain, great, natural FORCE to your body, and by which you may, without effort, trouble or inconvenience, treat your own self in the privacy of your home for debility and lost vitality, without using a single drug or medicine? This great FORCE, as a restorer of vitality and as a means to overcome those weaknesses which result from indiscretion and unnatural practices, is to-day being used all over the civilized world, and I give it as my honest opinion, based upon a vast observation and study, that any man anywhere, who leads a decent, manly life and who applies this marvellous FORCE in a scientific and rational way, can, without employing a single drug, be restored again to a state of perfect, rugged health and vigor, without a remaining ache, pain or weakness.

As we all know, these debiliating weaknesses handicap a man in every condition of life, while, on the other hand, a perfect speimen of vigorous, robust, lusty manhood is ever admired by both women and men alike, while, of course, it is certainly only such a man who can attain the really great success of life. Therefore, I say to you, no matter what your size, whether you are small or large, no matter what your occupation, no matter whether you are a college graduate or workng on the farm or in the factory, no matter whether you are young or elderly, it is all a question of your vigor and your vitality, and if I can give you a good, abundant supply of this same great power of VITAL FORCE, then it is easy to believe that I can completely restore your vigorous health, can overcome the evil of past indiscretions so you will be exactly the same in your influence over people, exactly the same in your manly bearing as other manly, strong-nerved, warm-blooded fellows of your acquaintance.

With an idea of attaining this all for you, I recommend you to investigate a simple little VITALIZING APPLIANCE of my invention, which I am now sending out in great numbers for use by men everywhere who need new manly strength. This little VITALIZER is very light, weighing only several ounces, and can be worn without any one suspecting that you are wearing it. You buckle it on your body upon going to bed and take it off mornings. Thus while you sleep it sends its wonderful power which I call VITALITY or VITAL FORCE, into your blood, nerves and organs. Users say it takes pain and weakness out of the back from one application, and further say 60 to 90 days' time is sufficient to restore a state of health, strength and vigor. I am not offering this VITALIZER here for sale, but want you first to send for my book, that you may learn all about the whole wonderful subject, and why I get such quantities of testimonials from users everywhere telling of results after drugs completely and utterly fail.

NOTE—With special attachments VITALIZER is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, nervousness and general ill health. Please write for book to-day, or, if near by, I should like you to call. Hours—9 to 6.

Use Coupon; Get Free Book

Remember, the little illustrated book which I send free, sealed, by mail, as per coupon below not only fully describes my VITALIZER, telling of a special offer by which you may get one on special terms for use in your own case, but contains a great fund of private advice for men, some good, wholesome cautions, and a lot of general information that might be of value to you to the end of your days. Therefore, please write or call.

FARMER ADS. BRING RESULTS.

The Result of New Biunswick's First Egg Laying Contest.

The New Brunswick Agricultural Department offered prizes to the different Poultry Associations of New Brunswick of $60 to each Association for a six months Egg Laying Contest, of ten (10) hens to each pen.

They found there was a great deal of interest taken in this, and it showed what could be done where systematic care and attention were given to poultry and a correct account kept of the number of eggs received and the cost of producing them All the Poultry Associations have spoken highly of the benefits that have been derived from this Egg Laying Contest. The results which have been obtained from Seth Jones, Poultry Superintendent, are as follows:

Westmorland County Poultry and Pet Stock Association, Twelve (12) entries.

1st prize, N. J. Govang, Moncton, R. C. White Leghorns, 1112 eggs; 2nd prize, Samuel Steeves, Sunny Brae, White Wyandottes, 1074 eggs; 3rd. prize, Watson Lutz, Moncton, Barred Plymouth Rocks, 1015 eggs; 4th prize George McEacheren, Moncton, Blue Andulusians, 968 eggs.

Charlotte County Poultry and Pet Stock Association, Eight (8) entries:

1st prize, C. F. McGarity, Milltown, W. F. Black, Spanish, 1187 eggs; 2nd, R. W. Whittock, St. Stephen, S. C. White Leghorns, 118 eggs; 3rd, H. D. Dinsmore, St. Stephen; S. C. Rhode Island Reds, 961 eggs; 4, F. M. McCready, St. Stephen, R. C. Rhode Island Reds, 946 eggs.

York and Sunbury Counties Poultry and Pet Stock Association, Two (2) entries.

1st prize, John Oldham, Fredericton, Black Minorcas, 984 eggs; 2nd, Ernest Pringle, Stanley, R. C. Brown Leghorns, 936 eggs.

Carleton and Victoria Counties Poultry and Pet Stock Association Thirteen (13) entries.

1st prize, Mrs. A. D. Hovey, East Brighton, White Leghorns, 1643 eggs, 2nd, Mrs. A. D. Hovey, East Brighton, White Orpingtons, 1579 eggs; 3rd Hartland Poultry Yards, Hartland Barred P. Rocks, 1140 eggs; 4, R. A. McKay, Centreville, White Wyandottes.

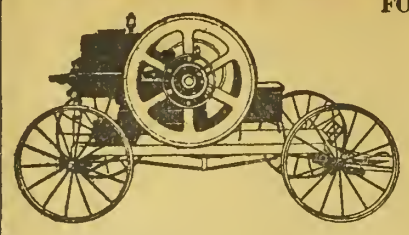
The Crate Fattening of Poultry.

Practical experience has shown that crate feeding is not only a very satisfactory but also an economical method of fattening poultry. The saving of the amount of feed required to produce one pound of gain is quite marked, and the feeder is enabled to observe to greater advantage the progress being made by individual birds. He can also, if necessary, curtail the duration of the feeding period in the case of birds which have attained their maximum weight and are ready to be placed in the furnishing crate.

Crate fattening cannot with success be carried on in a haphazard way. The feeder requires to understand the principals of what he is at and to give the necessary attention to the details of his work. In order to teach the proper method of feeding poultry in crates the Live Stock Commissioner at Ottawa has had prepared a seasonable illustrated pamphlet on the subject which explains clearly the construction of a fattening crate, the constituents and preparation of proper rations, the method of feeding, killing and dressing birds and information regarding packing for market. The work which is designated Pamphlet No. 2 of the Live Stock Branch is available to all who apply for it while the edition

FOR YOUR FARM, YOUR HOME, YOUR FACTORY

FOR EVERY POWER PURPOSE, A



GILSON

"GOES-LIKE-SIXTY"

ENGINE

MORE VALUE, MORE POWER, MORE SERVICE, MORE SATISFACTION

Does satisfaction mean anything to you? Does money saved in fuel, in time, in repairs and expense bills appeal to you? Get Gilson Facts, and find out how the Gilson 60-SPEED engine does the greatest variety of work—how it gives the maximum satisfaction—saves money in equipment, and yields 100% service at lowest cost. Every engine covered by a cast-iron guarantee.

NEW FEATURES AND LATEST IMPROVEMENTS

The new Gilson 100% SERVICE ENGINES, 4 H P and upwards, are equipped with our new friction clutch pulley with five interchangeable rims, each of a different diameter. Change to the proper speed for every job in a few minutes. A NEW and EXCLUSIVE GILSON FEATURE. These engines are also equippeu with a magneto, without batteries or coil, with spark retarder,—no cranking necessary. A child can start them.

We also make 60-SPEED engines in 1½ and 3 H P sizes. These are mounted on truck, with line shaft and five interchangeable pulleys, and pump-jack. Drop us a card to-day, and we will send you full descriptive literature. We are making special prices to the first purchaser of one of these engines in every locality. Write NOW.

Just Make This Test

SUPPOSE you select a rundown horse, cow, sheep or hog and try the effect of Pratts Animal Regulator. It will not cost you a cent to make the experiment, because we have authorized your dealer to refund your money instantly if it fails. If it puts the animal on its feet, causes it to put on flesh, and places it in prime condition, you will consider the money well spent.

Pratts Animal Regulator

is the original stock regulator of America, and for 42 years has been recognized as the most reliable and effectual regulator and tonic for all domestic animals. It is composed of pure medicinal roots, herbs and barks, so blended as to act gently but surely upon the blood, bowels, liver and digestive organs, ensuring perfect digestion and causing the animal to draw more nourishment from a reduced amount of feed.

"Your Money Back if It Falls."

At your dealer's, $3.50 per 25-lb. pail; also in packages at 25c., 50c. and $1.00.

Send 10c. to cover postage, wrapping, etc., and we will mail you Pratts "Pointers on Cows, Hogs and Sheep"—172 pages—or "Pointers on Horses"—183 pages—both books for 20c. Use the Coupon.

Old Hens.

Why it is old birds are tolerated is past my comprehension. Every week in poultry papers fanciers are recommended never to keep their birds more than a second summer, yet some people, simply because they have a certain love for one pen, or because they have laid a large number of eggs, will not kill them off, and this is one of the reasons why poultry farming at the present time is often so unsatisfactory, and egg-production, especially in winter, is on a reduced scale. Yearling hens are 'not anywhere near as good layers as pullets; some of them do very well, but others can not be depended on. A man who wants a big quantity of winter eggs must keep pullets, because they are sure to lay well if he looks after them in proper fashion.

The exact time to kill off two-year-old hens is also most important; many farmers I know usually sell fifty or sixty birds all at the same time; they like the idea of getting rid of a big quantity. This is a handy method no one will dispute, but it means that quite a large number of birds must be sacrificed while still laying. The best plan is to carefully examine each bird, and when it is found that they are not laying, they should be sold off singly to customers in the district. Buyers of old hens can easily be found at a good price per pound live weight. Or another plan one d ozen birds can be selected out each week, and sent to the nearest poulterer. This system is better than getting rid of fifty or one hundred birds in one lot. If half of the birds would only lay six or ten eggs each, surely these eggs are worth having, especially at prices now prevailing!

Those who have old hens that are entering the moult should get rid of them quickly. The markets are crying out for good, heavy hens, and willing to pay high prices, but as soon as large numbers are offered prices will drop very quickly, and instead of making 60 to 75 cents per head little more than half this amount will be made. If most of the eggs have been obtained from a flock of birds little time should be lost in getting rid of the non-layers. It is only by careful work in this direction that big profits can be made.

Sprouting Oats for Winter Feeding.

Many of our readers, no doubt, have tried the feeding of sprouted oats to hens during the winter; a great many more have not. Sprouted oats supply during the winter about the best imitation of summer pasturage that is possible to obtain.

As to the method of preparing these, one poultry expert, Mr. Bourlay, says:

"The method of preparing sprouting oats is as follows:—

"The quantity of oats required is soaked overnight in a bucket of water and then placed in boxes or tins which should have holes bored or punched through the bottom to allow drainage. No soil of any description is used, but a layer of the grain is placed in each box or tin to the depth of about one inch. These receptacles containing the oats are then placed in a dark place and the grain is well watered once daily with an ordinary water can fitted with a rose spray. As a dark place in which to sprout oats, we use large tanks which are covered with old sacks in order to keep them dark, but packing cases would serve the purpose equally well. It is necessary to place the tins or bricks or pieces of wood so that they are raised from the floor of the sprouting chamber; otherwise they are likely to be partially submerged in water which is liable to accumulate from the daily watering. After the grain has been in the dark chamber for four or five days an examinaeion will show that it has begun to throw out fine white roots, and this is quickly fallowed by young shoots or sprouts which rapidly grow until in ten or twelve days' time you have the tin or box full of lovely green sprouted oats which the fowls will eat greedily. If left too long, the sprouts lose their fresh green color and gradually turn yellow. While the oats have been sprouting, the roots have also been growing rapidly, and by the time the green food is ready it will be found that the grain has been bound together into a solid mass by these, so that it is necessary to cut the mass into sections with a spade or sharp knife. The oats should not be watered for twenty-four hours before feeding in order that the roots and grain may dry out to a certain extent. When ready for use turn the whole mass out of the receptacle in which it has been grown, and cut up with a sharp spade or knife into blocks, and give to the birds who will eat both the roots and the green growth. It is occasionally found, on turning out a tin of sprouted oats, that a certain amount of fermentation has set in at the bottom of the roots. In such cases it is necessary to cut off the affected parts, for, if fed to the poultry, it is liable to cause disease."

Nova Scotia Hen Holds World Record

Rev. W. B. Crowell, of Arcadia, has a pullet of the Barred Plymouth Rock variety, which has beaten the world's record in laying the largest number of eggs in one year. Her product during the time specified was 292 eggs.

Rev. Mr. Crowell sent to the American Poultry Journal attested ment of her day by day record, which was acknowledged by Dr. Prince T. Woods, managing editor. This journal is the leading poultry journal in America, and it sends the following with its acknowledgement:

"It looks as if "Lady Morley' (his pullet's name) is world's champion to date. Oregon Experimental station is a close second with a crossbred hen with 291 eggs to her credit. Expect to use the data in December editorials."

Mr. Crowell has a flock of sixteen pullets of the same variety, each of which produced 205 eggs in an average of 283 laying days this year.—Yarmouth Herald.

A patch may not be a handsome thing, though sometimes one is handsomely put on; but "handsome is that handsome does." A patch usually tells a handsome story, as well as covering what might be rags and disgrace. It tells a story of the thrift that is determined to save, pay its bills and owe no man anything. Hence, all honor to the patch.

If honey granulates or candies, it may be liquefied by setting the vessel containing it in another vessel containing hot water; not too hot, or it will spoil the color and flavor, and honey contains the most delicate of all flavors.—that of the flowers from which it was taken. It may take half a day or more to melt the honey.

INTERNATIONAL STOCK FOOD

Makes The Big Money For Hog Breeders

"I shipped a car of Hogs to South Omaha about 10 days ago. There were 7,500 hogs on the market that day. I had given mine International Stock Food. For my 64 heads, I received 25c. per hundred pounds more than any of the other sellers. Hogs all around my pen sold at 25c. per 100 lbs. less, so I topped the market for the day and week. Say, I sure felt proud. I lay it all to using International Stock Food".
JOHN WELLS, HARVARD, Nebraska.

International Stock Food keeps the brood sows well and strong—they give more milk—and raise more and stronger pigs. It's just what the "fall" pigs need to keep them fat and vigorous all winter and have them ready to market when prices go up.

Sold by dealers everywhere. If you will write and tell us how many head of stock you own, we will forward to you free, our $3,000, Stock Book. 103

INTERNATIONAL STOCK FOOD CO. LIMITED, TORONTO.

Molascuit Meal

This Cattle Food is a pure product of the Sugar Cane, which, as everyone knows, is the richest grass in the world. All Cattle and other stock owners will be aware of the value of Sugar as feed stuff for their animals, and **"Molascuit"** contains more than 50 p. c. of pure Sugar. Give it a trial, and the improved condition of your stock will surprise you. Your horses after a hard day's work, deserve a treat,—give them a handful or so of "Molascuit" with their other food—price is very reasonable.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

said Mr. Wickfield. "But I'll tell you what you can do, Miss Trotwood."

"What's that?" inquired my aunt.'

"Leave your nephew here, for the present. He's quite a fellow. He won't disturb me at all. It's a capital house for study. As quiet as a monastery, and almost as roomy. Leave him here."

My aunt evidently liked the offer, though she was delicate of accepting it. So did I.

"Come, Miss Trotwood," said Mr. Wickfield. "This is the way out of the difficulty. It's only a temporary arrangement, you know. If it don't act well, or don't quite accord with our mutual convenience, he can easily go to the right-about. There will be time to find some better place for him in the meanwhile. You had better determine to leave him here for the present!"

"I am very much obliged to you," said my aunt; "and so is he, I see; but—"

"Come! I know what you mean," cried Mr. Wickfield. "You shall not be oppressed by the receipt of favors, Miss Trotwood. You may pay for him, if you like. We don't be hard about terms, but you shall pay if you will."

"On that understanding," said my aunt, "though it doesn't lessen the real obligation, Ishall be very glad to leave him."

"Then come and see my little housekeeper," said Mr. Wickfield.

We accordingly went up a wonderful old staircase; with a balustrade so broad that we might have gone up that, almost as easily; and into a shady old drawing-room, lighted by some three or four of the quaint windows I had looked up at from the street: which had old oak seats in them, that seemed to have come of the same trees as the shiny oak floor, and the great beams in the ceiling. It was a prettily furnished room, with apiano and some lively furniture in red and green, and some flowers. It seemed to be all old nooks and corners; and in every nook and corner there was some queer little table, or cupboard, or bookcase, or seat, or something or other, that made me think there was not such another good corner in the room; until I looked at the next one, and found it equal to it, if not better. On everything there was the same air of retirement and gentility that marked the house outside.

Mr. Wickfield tapped at a door in a corner of the panelled wall, and a girl of about my own age came quickly out and kissed him. On her face I saw immediately the sweet and placid expression of the lady whose picture had looked at me downstairs. It seemed to my imagination as if the portrait had grown womanly, and the original remained a child. Although her face was quite bright and happy, there was a tranquility about it, and about her—a quiet, good, calm spirit,—that I have never forgotten; that I shall never forget.

This was his little housekeeper, his daughter Agnes, Mr. Wickfield said. When I heard how he said it, and saw how he held her hand, I guessed what the one motive of his life was.

She had a little basket-trifle handing at her side, with keys in it: and she looked as staid and as discreet a housekeeper as the old house could have. She listened to her father as he told her about me, with a pleasant face; and when he had concluded, proposed to my aunt that we should go upstairs and see my room. We all went together, she before us. A glorious old room it was, with more oak beams, and diamond panes; and the broad balustrade going all the way up to it.

I cannot call to mind where or when, in my childhood, I had seen a stained glass window in a church. Nor do I recollect its subject. But I know that when I saw her turn round in the grave light of the old staircase, and wait for us, above, I thought of that window; and I associated something of its tranquil brightness with Agnes Wickfield ever afterwards.

My aunt was as happy as I was, in the arrangement made for me, and we went down to the drawing-room again, well pleased and gratified. As she would not hear of staying to dinner, lest she should by any chance fail to arrive at home with the grey pony before dark; and as I apprehended Mr. Wickfield knew her too well, to argue any point with her; some lunch was provided for her there, and Agnes went back to her governess, and Mr. Wickfield to his office. So we were left to take leave of one anoth-

She told me that everything would be arranged for me by Mr. Wickfield, and that I should want for nothing, and gave me the kindest words and the best advice.

"Trot," said my aunt in conclusion, "be a credit to yourself, to me, and Mr. Dick, and Heaven be with you!"

I was greatly overcome and could only thank her, again and again, and send my love to Mr. Dick.

"Never," said my aunt, "be mean in any thing; never be false; never be cruel. Avoid those three vices, Trot, and I can always be hopeful of you."

I promised, as well as I could, that I would not abuse her kindness, or forget her admonition.

"The pony's at the door," said my aunt, "and I am off! Stay here."

With these words she embraced me hastily, and I went out of the room, shutting the door after her. At first I was startled by so abrupt a departure, and almost feared I had displeased her; but when I looked into the street, and saw how dejectedly

Better Than Spanking.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her today if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

[illegible] drove away without looking up, I understood her better, and did not do her that injustice.

By five o'clock, which was Mr. Wickfield's dinner-hour, I had mustered up my spirits again, and was ready for my knife and fork. The cloth was only laid for us two, but Agnes was waiting in the drawing-room before dinner, went down with her father, and sat opposite him at the table. I doubted whether he could have dined without her.

We did not stay there, after dinner, but came up-stairs into the drawing room again; in one snug corner of which Agnes set glasses for her father, and a decater of port wine. I thought he would have missed its usual flavor, if it had been put there for him by any other hands.

There he sat, taking his wine, and taking a good deal of it, two hours: while Agnes played on the piano, worked and talked to him and me. He was, for the most part, gay and cheerful with us; but sometimes his eyes rested on her, and he fell into a brooding state and was silent. She always observed this quickly, I thought, and always aroused him with a question or caress. Then he came out of his meditation, and drank more wine.

Agnes made the tea, and presided over it; and the time passed away after it, as after dinner, until she went to bed: when her father took her in his arms and kissed her, and, she being gone, ordered candles in his office. Then I went to bed too.

But in the course of the evening I had rambled down to the door, and a little way along the street, that I might have another peep at the old houses, and the grey Cathedral; and might think of my coming through that old city on my journey, and of my passing the very house I lived in, without knowing it. As I came back, I saw Uriah Heep shutting up the office; and feeling friendly towards everybody, went in and spoke to him and at parting, gave him my hand. But oh, what a clammy hand it was! as ghostly to the touch as to the sight! I rubbed mine afterwards, to warm it, and to rub his off.

It was such an uncomfortable hand, that, when I went to my room, It was still cold and wet upon my memory. Leaning out of the window, and seeing one of the faces on the beam-ends looking at me sideways, I fancied it was Uriah Heep got up there somehow, and shut him out in a hurry.

CHAPTER XVI.

I Am a New Boy in More Senses Than One.

Next morning, after breakfast, I entered on school life again. I went, accompanied by Mr. Wickfield, to the scene of my future studies—a grave building in a court-yard, with a learned air about that seemed very well suited to the stray rooks and jackdaws, who came down from the Cathedral towers to walk with a clerkly bearing on the grass-plot—and was introduced to my new master, Doctor Strong.

Doctor Strong looked almost as rusty, to my thinking, as the tall iron rails and gates outside the house; and almost as stiff and heavy as the great stone urns that flanked them, and were set up, on the top of the red-brick wall, at regular distances all round the court, like sublimated skittles for Time to play at. He was in his library (I mean Doctor Strong was), with his clothes not particularly well brushed, and his hair not particularly well combed: his knee smalls unbraced; his long black gaiters unbottoned; and his shoes yawning like two caverns on the hearth-rug. Turning upon me a lustreless eye that reminded me of a long forgotten blind old horse who once used to crop the grass, and tumble over the graves, in Blunderstone churchyard, he said he was glad to see me; and then he gave me his hand; which I didn't know what to do with, as it did nothing for itself.

But, sitting at work, not far off from Doctor Strong, was a very pretty young lady—whom he called Annie and who was his daughter, I supposed—who got me out of my difficulty by kneeling down to put Doctor Strong's shoes on, and button his gaiters, which she did with great cheerfulness and quickness. When she had finished, and we were going out to the school-room, I was much surprised to hear Mr. Wickfield, in bidding her good morning, address her as "Mrs. Strong;" and I was wondering if she could be Dr. Strong's son's wife, or could she be Mrs. Doctor Strong, when Doctor Strong himself unconsciously enlightened me.

"By-the-Bye, Wickfield," he said, stopping in a passage with his hand on my shoulder; "you have not found any suitable provision for my wife's cousin yet?"

"No," said Mr. Wickfield. "No. Not yet."

"I could wish it done as soon as it can be done, Wickfield," said Doctor Strong, "for Jack Maldon is needy, and idle: and of those two bad things, worse things sometimes come. What does Doctor Watts say," he added, looking at me, and moving his head to the time of his quotation, "Satan finds some mischief still, for idle hands to do.' "

"Egad, doctor," returned Mr. Wickfield, "if Doctor Watts knew mankind he might have written, with as much truth, "Satan finds some mischief still, for busy hands to do." The busy people acheive their full share of mischief in the world, you may rely upon it. What have the people been about, who have been the busiest in getting money, and in getting power, this century or two? No mischief?"

"Jack Maldon will never be very busy in getting either, I expect," said Doctor Strong, rubbing his chin thoughtfully.

"Perhaps not," said Mr. Wickfield, "and you bring me back to the question, with an apology for digressing. No, I have not been able to dispose of Mr. Jack Maldon yet. I believe," he said this with some hesitation, "I penetrate your motive, and it makes the things more difficult."

"My motive," returned Doctor Strong, "is to make some suitable provision for a cousin, and an old play-fellow of Annie's.

"Yes," I know, said Mr. Wickfield, "at home or abroad."

"Ay!" replied the Doctor, apparently wondering why he empasized the those words so much. "At home or abroad."

"Your own expression, you know," said Mr. Wickfield. "Or abroad."

"Surely," the Doctor answered. "Surely. One or other."

"One or other? Have you no choice? asked Mr. Wickfield.

"No," returned the Doctor.

"No?" with astonishment.

"Not the least."

"No mottie," said Mr. Wickfield, "for meaning abroad, and not at home?"

"No," returned the Doctor.

"I am bound to believe you, and of course I do believe you," said Mr. Wickfield. "It might have simplified my office very much, if I had known it before. But I confessed I entertained another impression."

Doctor Strong regarded him with a puzzled and doubting look, which almost immediately subsided in

to a smile that gave me great encouragement; for it was full of amiability and sweetness, and there was a simplicity in it, and indeed, in his whole manner, when the studious, pondering frost upon it was got through, very attractive and hopeful to a young scholar like me. Repeating "No," and "not the least," and other short assurances to the same purport, Doctor Strong jogged on before us, at a queer, uneven pace: and we followed: Mr. Wickfield looking grave, I observed, and shaking his head to himself, without knowing that I saw him.

The school-room was a pretty large hall, on the quietest side of the house, confronted by the stately stare of some half dozen of the great urns, and commanding a peep of an old secluded garden belonging to the Doctor, where the peaches were ripening on the sunny south wall. There were two great vines in tubs, on the turfs outside the windows: the broad hard leaves of which plant (looking as if they were made of painted tin) have ever since, by association, been symbolical to me of silence and retirement. About five-and-twenty boys were studiously engaged at their books when we went in, but they rose to give the Doctor good morning, and remained standing when they

"A new boy, young gentlemen," said the Doctor; "Trotwood Copperfield."

One Adams, who was the head boy, then stepped out of his place and welcomed me. He looked like a young clergyman, in his white cravat, but he was very affable and good-humored; and he showed me my place, and presented me to the masters, in a gentlemanly way that would have put me at my ease, if anything could.

It seemed to me so long, however, since I had been amongst such boys, or among any companions of my own age, except Mick Walker and Mealy Potatoes, that I felt as strange as ever I had done in my life. I was so conscious of having passed through scenes of which they could have no knowledge, and of having acquired experiences foreign to my age, appearance and condition as one of them, that I half believed it was an imposture to come there as an ordinary little school-boy. I had become, in my Murdstone and Grinby time, however short or long it may have been, so unused to the sports and games of boys, that I knew I was awkward and inexperienced in the commonest things belonging to them. Whatever I had learned has so slipped away from me in the sordid cares of my life from day to night, that now, when I was examined about what I knew, I knew nothing, and was put into the lowest form in the school. But, troubled as I was, by my want of boyish skill, and of book-learning, comfortable by the consideration, that, in what I did know, I was much farther removed from my companions than in what I did not. My mind ran upon what they would think, if they knew of my familiar acquaintance of the King's Beach Prison! Was there anything about me which would reveal my connection with the Micawber family—**all those pawnings**, sellings, and suppers—in spite of myself? Suppose some of the boys had seen me coming through Canterbury, way, worn and ragged, and should find me out? What would they say, who mad so light of money? if they could know how I had scraped my half-pence together, for the purchase of my daily saveloy and beeer, or my sauces and pudding? How would it affect them, who were so innocent of London life and London streets, to cover how knowing I was (and was ashamed to be) in some of the meanest phases of both; all this ran in my head so much, on that first day at

WOODEN pails and tubs are as much ou of date as the scythe and the sickle—and just as unpractical.

Eddy's Fibreware

gives superior results—for less money. Pails, tubs, dairy utensils, etc.. made of this material are light, tight and durable. They have no hoops to drop off—no seams to crack. And they outwear the wooden articles many times over.

Ask Your Dealer

"ust as Good as Eddy's Matches."

Her Cough Racked Her Terribly.

DR. WOOD'S NORWAY PINE SYRUP Effected A Cure.

Obstinate coughs and colds yield to the greatful, soothing and healing power of Dr. Wood's Norway Pine Syrup, and for the racking, persistent cough, often present in consumptive cases, it will be found exceedingly beneficial and pleasant to take. The use of it is generally indicated wherever symptoms of throat, or lung troubles appear, but especially so with all persons of a consumptive or catarrhal tendency, as its prompt curative properites speedily remove the danger, and restore the throat and lungs to a sound healthy state if used in time.

Mrs. Edward Patterson, Young's Cove Road, N.B., writes:—"I have had occasion to use Dr. Wood's Norway Pine Syrup, and can say that it is certainly a good medicine. About a year ago I contracted a severe cold which settled on my lungs, and left them in a very weak state. The cough racked me terribly, and I was in despair until a friend advised me to give Dr. Wood's Norway Pine Syrup a trial. I got a bottle, and before I had it half gone I found relief. I used two bottles, and have never been bothered since. I would not be without it in the house."

Price, 25c.; family size, 50c. Manufactured only by The T. Milburn Co. Limited, Toronto, Ont.

Doctor Strong's, that I felt distrustful of my slightest look gnd gesture; sunk within myself whensoever I was approached by one of my new schoolfellows; and hurried off, the minute school was over, afraid of committing myself in my response to any friendly notice and advance.

(Continued in next issue)

Dairying, Fruit and Cold Storage.

Without cold storage the dairying and fruit industries would be greatly handicapped as much valuable produce would be destroyed by decay. Under such circumstances the cost of living would have mounted much higher than it has, and there would be little hope of establishing outside markets. Because these several lines of industry are closely allied they are all grouped under a single branch of the Dominion Department of Agriculture, that of the Dairy and Cold Storage Commissioner.

This Branch, under Mr. J. A. Ruddick, has become a far reaching organization extending from the milking sheds and the orchards even to the great markets of the United Kingdom. Through the Dairy division encouragement is given farmers to increase the production of their herds, instructions are issued to reach the best methods of turning out fine butter and cheese. The Fruit division seeks to enlighten growers on the condition of crops, to teach correct methods of productiob and marketing and to establish confidence in the value of Canadian fruit. The Cold Storage service assists institutions that require refrigeration to erect proper warehouses; during warm months aid is given railways that carry fruit and da ry products to maintain low temperatures in their cars; and help is provided to secure cool temperatures to export produce while on the ocean. The Extension of Markets division exercises a close supervision over the handling of perishable farm produce in transit and, as opportunity offers, transportation companies are advised of needed improvements in their equipment. Besides other duties it keeps a careful register of the wholesale weekly prices of all manner of farm produce and publishes these in the Annual Report of the Branch.

The duties of this Branch of government service enumerated are by no means complete, but they serve to indicate the nature of its work which bears a close relation to the cost of living. They are selected at more or less random from the Annual Report for the past fiscal year, which contains a large amount of useful information. This volume, which is made up of a general review by the Commissioner and eight appendices, is available to those who apply for it to the Publications Branch, Department of Agriculture, Ottawa.

PILES CURED at HOME by New Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write to-day to Mrs. M. Summers, Box P. 309, Windsor, Ont.

Swine Fever.

Is known by several local names. such as pig thphoid, red soldier, the rose, the purples, pig distemper, and on the Continent two serums are used as a preventive, one form the lung and intestine form, another for the hog cholera form. Wallis Hoare's "System of Veterinary Medicine," says, "It is now universally accepted that a filtriable ultra-visible virus is the true cause of swine fever, and that the so-called swine fever bacillus or bacillus choleroe suis, when presebt in the blood and tissues of pigs suffering from the disease, is probably a secondary invgder, but an important acessory factor, most probably responsible for the characteristic lesions of the disesse." The serum is used generally as a preventive, but is sometimes used as a curative, but is not advised by the German authorities on account of its expense, etc.

Two serums are injected subcutaneously by means od sterilized syringe on the inside of the leg, and one other part of the body—generally behind the ears. In Germany the pigs are injected when a few days old, and it is held that it renders them more or less immune to swine fever for life. When a herd is attacked all those animals not showing symptons or having a slight attack, are injected so as to prevent its spred, those having it badly are killed. The styes, etc., are disinfected, and the usual precautions to prevent its spread are also taken. It is claimed that this method reduces the mortality quite 60 per cent.

It is recommended to use the serum again in later life, as the body lases its immInity to a certain extent. The preventive dose varies from seventy-drops to 300 drops, according to the size of the pig. As in its preparation the serum is defiltered, mixed with a suitable antiseptic, it is perfectly safe, and does not give the animal a mild attack of the disease. It is claimed that the serum, if properly stored in air-tight sterilized bottles, will remain good for years. Veterinary surgeons and owners have for years, owing to the disease being included in the Diseases of Animals Acts, been forced to slaughter all cases of the disease, so that treatment, etc., has been in England at a standstill, and we can only fallback on the foreign reports for stastics, etc., as to the result of various serums employed as preventative and curative. Nearly every country with the exception of England is using free,y in one form or other the various serums emand with the small pig population of the world, compared with the number of consumers of pork and its products, it is to be hoped that some means of preventing its spread or satisfactory method of treatment will be discovered, as the scourge is responsible for more deaths in pigs than all the other diseases put together.—Southern Vet.

NEW COAL OIL LIGHT BEATS ELECTRIC OR GASOLINE

10 Days FREE—Send No Money

We don't ask you to pay us a cent until you have used this wonderful modern light in your own home for ten days, then you may return it at our expense if not perfectly satisfied. We want you to prove for yourself that it gives five to fifteen times as much light as the ordinary oil lamp; beats electric, gasoline or acetylene. Lights and is put out just like the old oil lamp;

BURNS 70 HOURS ON 1 GALLON OIL

Gives a powerful white light, burns common coal oil (kerosene), no odor, smoke or noise, simple, clean, won't explode. Guaranteed.

$1000.00 Reward

will be given to the person who shows us an oil lamp equal to this **Aladdin** in every way (details of offer given in our circular). Would we dare make such a challenge to the world if there was the slightest doubt as to the merits of the **Aladdin?** We want **one person in each locality** to whom we can refer customers. Write quick for our 10 Day Absolutely Free Trial Proposition, Agents' Wholesale Prices, and learn how to get **ONE FREE.**

AGENTS WANTED

to demonstrate in territory where oil lamps are in use. Experience unnecessary. Many agents average five sales a day and make $300.00 per month. One farmer cleared over $800.00 in 6 weeks. You can make money evenings and spare time. Write quick for territory and sample.

FREE This 150 PIECE Complete Scholar's Outfit FREE

BOYS AND GIRLS, NEVER BEFORE IN CANADA HAS SUCH A GRAND PREMIUM BEEN OFFERED AND SO EASY TO GET.

READ WHAT THIS GRAND SCHOLAR'S OUTFIT CONTAINS.

1 large leather bound school bag, 1 dozen fine quality H. B. pencils, 6 steel tip pen holders, 1 dozen 292 pennibs, 50 sheets of writing paper, 1 dozen envelopes to match, 1 box of 15 water color paints with brushes and pots, 10 beautiful drawing crayons of different colors, 1 fine quality steel blade penknife, 1 large hardwood slide top pencil box, 1 complete printing outfit containing type, ink, tweezers and stamping pad, 1 twelve inch ruler, 1 large memorandum book, 1 complete dater good for five years, 1 large rubber eraser, 1 steel blade pencil sharpener, and last but not least, 1 Swiss warbler the greatest invention for imitating birds and animals.

Think of it, this scholar's complete outfit is **FREE.** We are determined to sell a million bottles of Rose Perfume this year, and are sparing no expense to reach this mark.

Rose Perfume is a great improvement on the old style of perfume and goes twice as far. Everybody buys it because it is so good, and a present is given away with every bottle.

We give you one of these grand scholar's outfits **IF YOU WILL AGREE TO SELL ONLY 30 BOTTLES OF ROSE PERFUME AT ONLY 10c PER BOTTLE.** Any boy or girl can sell 30 bottles easy. No trouble at all.

We send you the Rose Perfume free and trust you until sold. Simply send us your name and address to-day. Every girl and boy should win one of these grand scholar's outfits.

Try. If you can't sell the Rose Perfume send it back to us.

Address to-day **THE ROSE PERFUME CO., Dept. S., 50** Toronto, Ont.

A WONDERFUL REMEDY

Orange Lily is daily curing the most obstinate cases of Female Disorders. Falling of the Womb, Leucorrhoea, Painful and Suppressed Menstruation, etc., etc., are all of them relieved from the start by its use, and a few weeks' or months' treatment accomplishes a complete cure. This remedy is a positive, scientific preparation, and is based on the discoveries of Pasteur and Lister. It is an applied treatment; that is, it is not taken internally, but is applied direct to the suffering parts, and it, therefore, acts with all the certainty of the known laws of chemical action. As it comes in direct contact with the diseased tissue, its antiseptic and nerve-food properties cannot help have a beneficent influence. I receive from 10 to 50 letters daily, speaking of the benefits and cures it is performing, and so sure am I that it will do what is claimed for it that I will send, absolutely free, a 35c box to every suffering woman who will write for it. Price, $1 per box, which is sufficient for one months' treatment. Address, MRS. FRANCES E. CURRAH, WINDSOR, ONT.

For Sale by Leading Druggists Everywhere.

MARKETS.

Charlottetown Market Report.

Date—December 4, 1913.

GRAIN—Oats, white, 35c to 36c; Black, 37c to 38c.

FEEDSTUFFS—Bran, $1.25 to 1.35 per 100 lbs.; Shorts, $1.40 to 1.50 per 100 lbs.; Middlings, 1.40 to 1.50; Oil Cake, 2.00; Cottonseed Meal, 1.80 to 2.00; Gluten Meal, 1.85; Corn Meal, 2.00 to 2.10.

LIVE STOCK.—Butcher's Cattle, 4c to 4½c, live weight; Stockers, $18.00 to 35.00; Milch Cows, 28.00 to 60.00; Sheep, 4½c to 5c live weight; Lambs, 5c to 6c lb. live weight.

DRESSED MEATS—Beef (Carcass) 8c to 10c lb; Beef, (Retail) 8c to 16c lb.; Mutton, 9c to 14c lb.; Pork, heavy, 8½c to 10½c lb.; Selects, 11c.

Horses.—Drafters, $125.00 to 250.00; Roadsters, 125.00 to 250.00, Carriage, 125.00 to 250.00.

DAIRY PRODUCTS—Creamery Butter, solids, 26c lb.; prints, 27c to 27½c dairy butter, tubs, 23c to 25c; prints, 24c to 26c; Cheese, 14c to 14½c lb.

POULTRY AND POULTRY PRODUCTS—Eggs, 30c doz.; Fowl, 10c to 12c lb.; Chickens, 10c to 14c lb; Ducks 13c to 14c lb.; Geese, 12½c to 13c lb.; Turkeys, 20c to 22c lb.

FRUIT—Apples, $2.50 to 4.00 bbl.

MISCELLANEOUS—Hay, pressed, $11.50 to 12.50 ton; Straw, 6.50 to 8.00 ton; Wool, 25c lb.; Beef Hides, 12c to 14c lb.; Sheep Skins, 90c to 1.25 each; Lamb Skins, 80c to 1.00 each.

VEGETABLES—Carrots, 30c to 40c bus.; Potatoes, 30c bus.; Turnips, 12c bus.; Beets, 30c to 35c bus.; Parsnips, 1.00 per 100 lbs.; Cabbage, 40c to 50c per 100 lbs.

There is little or no change in market conditions for farm produce since our last report. The continued mild weather has enabled farmers to finish up the fall work and also permit of their shipping considerable surplus of roots which would otherwise have had to be carried over till spring. Large quantities of turnips have been shipped at eleven to twelve cents, and potatoes at 30c. There is considerable rot in the potatoes in most sections and dealers have been rather timid about taking large quantities of them. Eggs are scarce and firm, in fact the receipts are so limited that the prices quoted are only nominal. With the near approach for the last sailing for Newfoundland the price of oats, which had firmed up for a few days is likely to ease off and we think that the inside prices quoted will likely be the best obtainable as soon as the last boat is away. Hay is not offered very freely but in sufficient quantities for present requirements as space available for shipments is very limited. The market for meats of all kinds continues firm and poultry is being readily picked up at the full price quoted. The local pork packers are the only buyers at present and it looks from this that they are paying full value. Select hogs at 11c per lb., including the weight of organs is a good price and farmers are killing as soon as stock is ready for market.

Halifax Market Report.

GRAIN.—Oats, 50c. to 51c. bus. bagged; Peas, $2.20 per bus.; Barley, for feed, $1.75 per 100 lbs.

FEED STUFFS.—Bran $25.00 to $25.50 ton; Shorts, $25.00 to $26.00 ton; Middlings, $26.00 to $27.00 ton; Oil-Cake, $2.00 per 100 lbs.; Linseed Meal, $2.00 per 100 lbs.; Cottonseed Meal, $36.00 to $37.00; Gluten Meal, $29.00 to $30.00 per ton; Corn Meal, $1.70 to $1.75 per bag.

GRASS SEEDS.—Timothy, 6½ to 7c lb.; Com Red Clover, 20c to 24c. lb.; Mam. Red Clover, 20c. to 24c. lb.; Alsike, 18c to 20c. lb.; Alsike, 18c. to 20c. lb.

LIVE STOCK.—Milch Cows, $45.00 to $60.00; Lambs, $4.50 to $5.00.

DRESSED MEATS.—Beef (retail), 16c. to 26c. lb.; Mutton, 14c. to 20c. lb.; Pork, (carcass), 12½c. to 13c. lb.

HORSES.—Drafters, $250.00 to $300.00; Roadsters, $200.00 to $250.00; Carriage, $175.00 to 200.00.

DAIRY PRODUCTS.—Creamery Butter, 32c. to 34c. lb.; Dairy Butter, 28c. to 30c. lb.; Cheese, 16½ to 17½c. lb.

POULTRY AND POULTRY PRODUCTS.— Eggs 35c to 50. doz.; Fowl, 16c. to 18c. lb.; Chickens, 18c. to 22c. lb.; Ducks, 20c. to 22c. lb.; Geese, 20c. to 23c. lb.; Turkeys, 24c. to 26c. lb.

FRUIT.—Apples, $2.50 to $4.00 per bbl.

MISCELLANEOUS.—Hay, $14.00 to $15.00 ton; Straw, $10.00 to $11.00

VEGETABLES—Potatoes 55c to 60c bus.; Turnips, 40c to 50c bus; Beets, 50c to 60c bus.; Cabbage, 35c to 60c. doz.

Practical Recipes.

Calf's Head Pie—Stew a knuckle of veal till fit for eating, with two onions, a few isinglass shavings a bunch of herbs, a blade of mace, and few pepper-corns in three pints of water.

Calves head pie.—Stew a knuckle of veal till fit for eating, with two onions, a bunch of herbs, a blade of mace, and a few pepper corns in three pints of water. Keep the broth for the pie. Take off a bit of the meat for the balls, and let the others be eaten, but simmer the bones in the broth till it is very good. Half boil the head, first fat, then lean, with balls and hard eggs cut in half, and so on untill the dish be full; but be carefulnot to place the pieces close, or the pie will be too solid, and there will be no space for the jelly. The meat must be first pretty well seasoned with pepper and salt, and a little nutmeg. Put a little water and gravy into the dish, and cover it with a tolerable thick crust; bake in a slow oven, and when done, pour into it as much gravy as it can possibly hold, and do not cut it till perfectly cold. In doing this use a very sharp knife, and first cut out a large bit, going down to the bottom of the dishes; when cut thus, thinner slices can be cut. The different colours and the clear jelly have a beautiful marble appearance.

Giblet Pie.—After very nicely cleaning goose or duck giblets, stew them with a small quantity of water, onion, black pepper, and a bunch of sweet herbs, till nearly done. Let them grow cold, and if not enough to fill the dish, lay a beef, veal, or two or three mutton steaks at the bottom. Use the liquor of the stew to baked, pour it into a large teacupful bake with the above; when the pie is of cream. Sliced potatoes may be added.

Beef Olives.—Cut slices ½ in. thick, and 4 in. square, lay on them a forcemeat of crumbs and bread, a little suet or fat, pepper and salt. Roll them and fasten with a small skewer; put them into a stewpan with gravy made of beef bones, or the gravy of the meat, and a spoonful or two of water. Stew till tender.

Prescription for a Stingy Man.

In the Woman's Home Companion appears a story in which is related an account of a prescription given to an exceedingly stingy farmer by a doctor. The farmer took the prescription to the druggist. The druggist told the farmer that he could not fill the prescription and said to the farmer: "If you will read it yourself you will see why." Whereupon the farmer adjusted his glasses and read to his astonishment:

"One hired girl to be taken as soon as you can get her, and kept constantly on hand thereafter.

"A few new dresses that the wives of your hired men wouldn't be ashamed to wear, a new hat and wrap to replace those you bought her last—13 years ago.

"All to be tinctured with at least as much daily consideration as you bestow upon your cattle."

Oil in the Home.

A little knowledge of lubrication will amply repay the time and attention it requires. Doors should move without apparent effort, and certainly without noise. Bureau drawers ought never to stick or bind. While other things may prove annoying, the machinery of our homes should be so oiled that its operation is perfect.

Here is the matter in a nut-shell. When two dry surfaces are rubbed together under pressure friction results, and this shows itself in several ways, such as the hard work required to cause the motion, and also as heat or noise and wearing or grinding away of the surfaces.

However smooth the surfaces in contact may appear, they are in reality rough, much like sandpaper, if, seen under the micorscope. It is, therefore, the interlocking of these projections which follows the friction While no material wrars to a perfectly smooth surface, still it may become much improved by some wear. this explains the easier working of a sewing machine or egg-beater after some use.

The only cure for all these evils is lubrication of ntome sort, which in practice does away with them. Noise especially—such as a squeaky door hinge—can always be stopped if the remedy—oil—can be properly applied. It separates the two bearing surfaces so that they do not actually come in contact, and really acts much like many little rollers in easing the mo- "soothing syrup" "wears out," so that it must be renewed from time to time.

One wise housekeeper has constantly at hand a large can, filled with heavy machine-oil. It is made of heavy sheet steel similiar to those used in shops and factories, and is much more durable and satisfactory than the light tin ones usually seen. After once realizing the necessity for it, she has had the pumps for weel and cistren, as well as the clothes-wringer and cream-freezer, thoroughly oiled once each month. Only a drop or two is required for each bearing, but care has to be taken that none of them is overlooked. Any oil remaining on the outside of the bearing is removed with a cloth kept for the purpose, otherwise it will collect dust and stain clothes coming in contact with it. For a long time the ice-cream freezer was the the only thing which she refused to have "oiled," fearing that in some way the oil would find its way into the cream. Finally she consented, after being shown that this was guarded against by the peculiar construction of the freezer, and that the labor of turning it could in that way be materially reduced.

Door hinges and knobs, window fasteners and other similiar contrivances she oils carefully when cleaning house and then wipes thoroughly afterward. Window fasteners, which it was almost impossible to operate, and doors which woke persons in neighboring rooms, if opened or closed at night, are now noiseless and well behaved.

A door lock, in which the key turned with great difficulty, was removed from the door and oiled, after first removing the side-plate. When replaced it worked perfectly. A peculiar discovery was also made regarding the latch moved by the hand knob. This worked with such difficulty that when the door was pushed shut without turning the knob, the door usually rebounded, swinging open again. A heavy slam was required to force this projection in and so allow the door to latch securely. After oiling, however, the slightest push was sufficient to close and latch the door with almost no noise.

KA-LOR-OID
TRADE MARK REGISTERED

(Colored RU-BER-OID, Canadian Patents Nos. 93,027 and 93,160)

KA-LOR-OID, in its beautiful, soft shades of Red and Green, is the **only** prepared roofing made in permanent colors. In KA-LOR-OID Roofing the colors are not painted on, but by our patented process are made an integral part of the exposed surface. They last as long as the roofing itself—and that means longer than any other prepared roofing has lasted, for KA-LOR-OID is made of the same materials, and has the same wonderful durability as RU-BER-OID Roofing in the regular Slate color.

ROOFING

You Must Break The "Family Group" When It Comes To Music

EACH one's taste is individual — his own — and different. No one, not even a genius—could suit you all. And yet every one in the family loves music and regrets the silent piano none can master. The

New Scale Williams Player Piano

With the "Meister- Touch—most human of all."

spans the "Great Divide" between you and music. It enables you to play as though yours were the most perfectly trained fingers in the world. The intricacies of MacDowell's harmonics—the crashing chords of Liszt's stupendous Rhapsodies—the brilliant two steps or the dream-like waltzes of Strauss; all roll from under your fingers without effort or fault. You play what you love most—in the way that suits you best. And so does everyone else in the family. The New Scale Williams Player Piano combines the technical ability of the world's greatest musicians with the opportunity for your own individual interpretation. Write for our Player Piano Book and the personally autographed letters of the renowned artists who use the New Scale Williams Piano. Both gladly sent on request. 4D

We will make you a generous allowance in exchange for your present piano.

The Williams Piano Co., Ltd., - - Oshawa, Ont.

DEALERS EVERYWHERE.

While machine oil is the best for general use, almost anything can be used in an emergency. Even water will stop the squeak of an oar-lock or pump-handle, but it requires frequent application. Olive oil or butter, tallow or lard would be much better, as they are good lubricants. They have the disadvantages, however, of being expensive and emitting a bad odor if they become rancid. Vaseline, is perhaps, the best of anything usually found in the house, and may, if desired, be used regularly for general work. For a sewing machine or clock, it is, of course, too solid, but for ice-cream freezers and other places where oil is desired which will not run,, it is very well adapted.

In the absence of light machine-oil, kerosene works well on sewing machines or typewriters. If used freely on cheap time-keepers, such as alarm clocks, which have passed their prime, will restore them to usefulness. This is due to its effect in washing away the dust and dirt which is clogging the mechanism as well as to lubrication of the bearings.

While these oils and greases are well adapted to metal surfaces, they should never be applied to wood. Many things about the house are, however, constructed of this latter material, and its constantly changing size with changes in the weather conditions makes its lubrication an important matter. Soap is probably the best for this purpose and should be rubbed thoroughly on the sides and especially on the edges of drawers: It proves equally effective on doors and windows.

Graphite, while a solid has marked lubricating properties. Mixed with oil it is frequently used on heavy machinery. Its value is due to the fact that the small flakes become packed tightly into the depressions in the bearing surfaces making them very smooth. A lead pencil is in fact a good substitute for oil-can in many cases. It will certainly stop the squeak of the door-hinge if the graphite can be worked into the rubbing surfaces. Raising the door slightly will assist in this work and may be easily done with a lever placed under it and pressed down with the foot.

In this age of steel, we must all become more or lenss engineers to properly care for and operate the machines which are becoming more and more to be a necessity in our daily lives. Lubrication is just as necessary for a bed caster which is to perform its work satisfactorily as for the engines of the ocean liner.—H. L. Whittemore.

What an Inch of Rain Means.

An acre of ground contains 43,560 square feet, consequently a rainfall of an inch over an acre of ground would mean a total of 43,560x144, or 6,272,-640 cubic inches of water, or an equivalent of 3630 cubic feet, weighing 113 tons.

We wish to call your attention to the fact that most infectious diseases such as whooping cough, diphtheria and scarlet fever are contracted when the child has a cold. Chamberlain's Cough Remedy will quickly cure a cold and greatly lessen the danger of contracting these diseases. This remedy is famous for its cure of colds. It contains no opium or other narcotic and may be given to a child with implicit confidence. Sold by all dealers.

Doesn't this Louden Litter Carrier look good to you?

One of these Litter Carriers would be a real help to you in the barn. A LOUDEN Carrier changes drudgery into child's play and enables a boy to do a man's work in half the time and with half the trouble—and it costs but little.

A pound pull lifts 40 lbs.

A BOY can easily hoist half a ton and push the carrier right out of the barn to the manure spreader or litter heap where it can be easily dumped. Runs smoothly, too, and never gets out of order.

LOUDEN Litter Carrier

Makes barn work easy and light—costs little—means a cleaner better barn—time saved—and bigger profits. Now's the time to have it installed.

Every Farmer should have the new LOUDEN Catalogue as a valuable guide and reference book on Farm Equipments. It is FREE for the asking.

LOUDEN MACHINERY CO. - Dept. 28 GUELPH, Ont.

Feed your stock with a Louden Feed Carrier

and lighten your barn work. A LOUDEN Carrier raises or lowers any distance up to 25 feet, and hoists **twice as much** as any other carrier. Stands anywhere; can't fall. Easily installed and strong enough for anything. Box of heavy galvanized steel — no wood.

2

CANADA Portland CEMENT

SOME men ask for so many bags of "cement"—

Others, more careful, say they want "Portland Cement"—

But the man who does the best work insists upon getting "Canada" Portland Cement—

And he looks to see that every bag bears this label

Annual Meeting of the Sussex and Studholm Agricultural Society.

The annual meeting of the Sussex and Studholm Agricultural Society was held at the Province al Dairy School at 3.30 o'clock on Monday afternoon, at which there was a good attendance of members. Col. H. Montgomery-Campbell, President, in the chair.

The mibutes of last annual meeting and directors' meetings since held were read by the Secretary, M. A. McLeod, and approved by the society. The Treasurer's statement of receipts and expenditures which was attached to the Auditor's report showed a good credit balance on the year's operations, and was approved of by the meeting. The Secretary also gave a statement of the various activities conducted by the Society during the year. It was resolved that in future the Judge of the standing crops competition be asked to furnish each contestant with a score card of his crop as soon as possible after any particular field had been judged. The object for this being that with a score card in hand the owner of the plot may see at a glance wherein his crop was deficient and thus enable him to rectify defects in future competitions.

Resolved that the Treasurer, be authorized, with Mr. Prescott's consent to reduce the note held by the Joshua Prescott estate, for loan against mortgage on driving park; as much as possible and give a renewal note for balance.

Resolved that a standing crop competition for Kings County be conducted for the year 1914, provided the usual grants are forthcoming.

Resolved that sections in the standing crops competition be open for red clover, alsike, and timothy plots, particulars of contest to be arranged by a committee to be appointed by the new board of directors.

Resolved. That a seed fair be held in Sussex in the Spring of 1914, provided the usual grants are forthcoming and that each and every farmer member be urged to put forth an effort to make an exhibit.

The question of the co-opaerative purchase of fertilizer material by the Society for the benefit of its members was discussed at some length and the general concensus of opinion was that such an action on the part of the Society would result in a very material saving in the reduction of cost. The Secretary read a letter from R. G. Murray, St. John re the proposed arrangement whereby the Government is being memorialized to lend assistance in the purchase of fertilizer for Agricultural Societies all over the Province. A Committee was appointed consisting of W. H. Venning, J. H. Manchrester, H. A. Flewelling, and the President and Secretary to keep in touch with this latter movement and formulate ways and means whereby the purchase ol fertilizer and seeds may be purchased collectively by farmers for use in the spring of 1914. Moved by H. R. McMonagle and seconded by E. O. McIntyre that an exhibition be held in Sussex in the fall of 1914. Moved as amendment made by W. H. Venning, and seconded by A. D. Freeze that the matter of the holding of an exhibition in the fall of 1914 be left for the consideration of the new board of directors; which amendment was carried.

The appointment of delegates to attend the 1914 Farmers' and Dairymen's Association was also on motion left to the new board of directors.

Col. H. Montgomery-Campbell, who has held the office of President for nearly 25 years, signified his wish to be relieved of the duty and did not wish his name again placed in nomination. A great number of the members of the Society urged him to again accept the office, but as he desired to withdraw, in deference to his wishes, they acceeded to his request and J. Frank Roach was elected President by acclamation. J. T. Prescott Vice-President also by acclamation. The Directors were named by a Nominating Committee consisting of A. D. Freeze, J. T. Prescott, Wm. Jamieson, and H. R. McMonagle, who submitted the following list which was approved by the meeting: Col. H. Montgomery-Campbell, James Manchester, Harvey Parlee, Geo. B. Jones, M. L. A., Hon. James A. Murray, A. D. Freeze, A. Branscombe, H. R. McMonagle, S. J. Goodliffe, C. W. McDougall, E. O. McIntyre, J. E. Fenwick, Murray Heustis, William Jamieson.

On retiring from the chair President Campbell made some fitting remarks regarding the success and activities of the Society. All down the years since its orgamization it had always been considered one of the foremost Agricultural Societies in the rovince and these successes had been achieved through the hearty co-operation of the officers and members. He expressed his appreciation of the generous support which had been given him while he occupied the chair; by the various boards of directors. He could proudly say that he had never known of a case where any officer of the Society had made an attempt to work society matters for personal motive or gain. The policy had always been, always do everything for the best interest of the Society and its members at large. While he had had the honor of presiding over several agricultural associations of various kinds from time to time he always considered the presidency of the Sussex and Studholm Society being more honorable than all others. From that capacity he had an opportunity to work for the best interests of his fellow farmers in his home district.

Following these remarks the Society tendered Col. Campbell a unanimous vote of thanks for the deep interest which he had always manifested in the Society.

At the close of the meeting the new Board of Directors met and reappointed M. A. McLeod, Secretary-Treasurer.

A Des Moines man had an attack of muscular rheumatism in his shoulder. A friend advised him to go to Hot Springs. That meant an expense of $150.00 or more. He sought for a quicker and cheaper way to cure it and found it in Chamberlain's Liniment. Three days after the first application of this liniment he was well. For sale by all dealers.

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my **free** ten days' trial of a **home treatment** suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men **cannot** understaud women's sufferings; what we women know **from experience**, we know better than any doctor; and thousands have proved there is **hope** even **for the hopeless** in my method of home treatment. If you suffer from **pain in the head, back,** or **bowels, feeling of weight** and **dragging down sensations, falling or displacement of internal** organs, **bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send to-day for my complete ten days' **treatment** entirely **free and postpaid,** to prove to yourself that these ailments can be easily and surely conquered at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and **when you are cured,** my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—**young or old.** To **Mothers** of **Daughters,** I will explain a simple home treatment which speedily and effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer, **write for the free treatment** suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. **Write and ask** for the **free treatment to-day,** as you may not see this offer again. Address:

State Agricultural Conventions.

(Continued from page 152)

The gathering together of this great array of organized industries into one common cause for improvement offers advantages that could not otherwise be available to the average citizen, there is not time even in one week of meetings to afford all the advantages of the full program of the various associations is greatly to be regretted. That the duty of the program committee in its efforts to dove-tail in the exercises of the various associatiobs so as to afford the greatest advantages to all is a hard one, anyone familiar with the work will cheerfully admit.

There is a strong tie of relationship, naturally, between all associations of an agricultural character in any province or district of country. The tiller of the soil may legitmately engage in any of these organizations. The farmer is a horticulturist, a dairyman, a florist, a breeder of live stock a bee keeper, a poultryman, etc., by his right to the soil and its adaptability to be turned to any line of production.

PRACTICE AND PLAN.

"An ounce of prevention is worth a pound of cure," so, avery little bit of practice is worth an infinity of plans. How often we find the time to make new plans of all kinds, when many old ones of some real value, if executed, are still left worthless because never put into practice. The places where most of all the maxim, "Union is strength," holds true, is the army, the place one man plans and thousands execute. The fewer assistants he has in his plans, the better, but the more help he has to carry them out the surer and more complete the result will be. The greatest folly of all is to plan without the assurance that one can carry it out well, for even the plan of only common adaptability, if well carried out, is far better than the best plan indifierently executed. Plan are things we can afford to economize. The thing we must be extravagant of is practice.

The Banner Oat Club is Doing Splendid Work.

A meeting of the Banner Oat Club was held in the office of John Grady, at Summerside, on Thursday, November 27th. The president, Rev. J. J. McDonald, of Kinkora, called the meeting to order and spoke of the work that had been done last year. The secretary, Thos. S. Waugh, then submitted his financial report whi(h was accepted.

The Club then proceeded to make arrangements for the sale of oats for this year. Several propositions were made by members in regard to the oats and a communication was read by the secretary from Joseph Read & Co., offering to purchase the whole of the oats or to handle it on commission. The Club decided to accept this offer of purchase and arrangements are being made for delivery. The Club however undertakes to guarantee the oats of its members and all Club oats leaving the Island through the firm of Joseph Read and Co., will be stencilled with the name of the Club on each bag or package.

It was further agreed upon that seed growers who are eligible for membership and who did not join the Club this year should be asked to contribute five dollars each toward the expenses, as this amhunt was contributed last year by members joining the Club.

The election of officers then took place and resulted in the re-electivn of the president, Rev. J. J. McDonald; Horace Wright, Bedeque, vice. president and Theodore Ross as secretary. The retiring secretary, Mr. Waugh, stated that he was to far from town and the telephone to act as secretary again and would not permit his name to go before the Club. The meeting then adjourned to meet at the call of the president.

The members fet that the Banner Oat Club was doing good work and would urge every farmer on P. E. Island who grows Banner oats and who entered fields in the Standing Fields of Grain Competition last year to apply for membership at once.

Sheep Notes.

Although there is time enough, it is a good plan to arrange for the production of spring food for the ewes and lambs—and, indeed, for the tegs, if there are any to be fed—at the earliest moment. The land to be devoted to each crop, including successions, may be selected, and the work arranged accordingly. I have seen crops growing on sheep farms which were eaten off by another farmer's flock owing to the inability of the tenant to obtain one for himself. Sometimes sheep fed in this way have paid their owner handsomely, his contribution having simply been a guarantee to consume so much cake on the land. Clearly, it is essential on a sheep farm to eat off the crops or a given portion of them in order to ensure a succeeding crop of corn and seeds in succession. As a rule, however, the difficulty is in obtaining a sufficiency of roots, vetches, and other forage crops to carry the flock on, for with plenty of food on the land it becomes possible to reduce that which is bought. In a poor season a good shepherd will go far with short keep assisted with hay, cake and crushed oats, whereas in a good season a careless shepherd will do just the reverse, and use quite as much of these foods, costing his employer more money than he should spend, and at the same time wasting a large portion of the crops on which he folds his charges.—English Exchange.

High Quality Builds Big Telephone Business

THIS business was organized to manufacture telephone equipment for independent local and municpal systems. Right from the start our equipment made records for efficiency. It did not take long for our goods to acquire a reputation for quality and reliability. As a result, our business has grown by leaps and bounds.

It is a well-known fact that we have been securing over 80 per cent. of the new telephone business in Ontario. The buainess, too has been secured with less effort than business secured by competitors. The satisfaction our telephones and equipment have given under all conditions has paved the way for easy business getting.

To judge how fast our business is growing, you'll remember we stated in a previous announcement that our business last year doubled that of the year before. Well, this year the first two months' sales total more than twice the 1912 sales for the same period. More and more is it being recognized by those in the local telephone business that we are the legitimate people to deal with. There are those in the telephone business who are interested in depreciating the success of the independent telephone movement and the developmedt of municipal systems. On the other hand, our business lies wholly and directly with the independent telephone systems, and it is to our own best interests to look after these systems well, as on their success depends the growth of our business.

If you would like a list of the large independent telephone systems built in Ontario during the last twelve months, just drop us a line. We would be glad to send you a list of the systems, with the make of the telephones they are using. In fact, if you'll name over the large independent telephone systems built during the last year in Western, Northern and Eastern Ontario you'll find that nine out of every ten are using our telephones and equipment.

You are absolutely safe in equipping your systems with our telephones. We guarantee them as regards material and workmanship. In fact, we guarantee all our equipment and materials. And in addition, we offer to send our telephones for Free Trial, so you can test and compare them with others right on your own lines before risking a dollar.

Ask for our No. 3 Bulletin—containing the latest information about building telephone lines—Also No. 4 describing our magneto telephones is free on request.

Also manufacturing agents for the Magnaphone Co., under Mr. George R. Webb's Canadian Patents No. 123363, No. 124537, No. 131145."

The Scientific Farming sf the Woodlot.

"There is no part of the farm which will give bigger returns for so little expenditure of time and labor as the woodlot." This statement in the July number of the Canadian Forestry Journal, is made by Mr. B. R. Morton, B. Sc. F., the silvical expert who is engaged by the Forestry Branch at Ottawa to demonstrate to the woodland owners of eastern Canada just how these bigger returns may be achieved. But if it is not possible to obtain such expert advice, there are yet three ways in which the farmer, by the exercise of ordinary common sence, can vastly improve the composition, production and reproduction of his woodlot.

The first thing necessary is to improve the character of the crop, which can be done by cutting down and using for fire-wood all deceased and deformed trees, as well as such species whose presence in the woodlot is nor desirable. Only too frequently is the method of cutting exactly the reverse The best trees are cut, often for purposes for which an inferior wood are left to seed-in the cut-over areas and to gradually crowd out the better varieties. Before cutting the farmer should consider first the use to which the wood is to be put, and second, the species-composition of the returns for a small acreage and for this purpose, rapid-growers such as popular, ash and elm should be encouraged, which should make an annual growth of from one-half to one cord per acre. Basswood too, will be in increasing demand because of its rapid growth, because it coppices readily and because of its value in small articles for which the wood is small sizes for the manufacture of excelsior, cooperage stock and other particularly adopted. Maple produces readily, and although not a rapid grower, it nevertheless yields a substantial revenue when it becomes large enough to tap. Soft woods like spruce, balsam and pine grow much more rapidly than hardwoods and might be advantageously grown for fuel of pulpwoohf.

When the most suitable species have been selected and the weed-trees removed, the woodlot must then be thinned until the crowns of the best formed remaining trees are seen to barely touch. An acre can only produce a given amount of wood each year and the fewer trees there are to share this yearly increment, and yet fully ultilize the crown space, the more rapid will be the growth of these trees.

The third requisite is the scientific farming of the woodlot, is that the cattle be kept out, especially after heavy cutting, when reproduction is most desired. Cattle are just as injurious to a young cron of tree seedlings as they are to a young crop of grain. They may indeed eat the grass in the woodlot, but they would just as soon, if not sooner eat the young and tender hardwood shoots, and the same can be said of the sheep. Even coniferous seedlings are not immune so that the certainity in reproduction is only assured by fencing-off the cut-over areas.

Dr. Fernow predicts that "There will be a time when the woodlot will sell the farm or will be a necessary part of the farm to make it valuable." In the seasons when his other work slackens the farmer could very easily improve his woodlot in anticipation of this time of increased wood value.

Household Hints.

To prevent prints from fading when being washed, soak black and pink prints in salt and water, and delicate mixed colors in pared potata water. Use alum.

It is the tritest and yet nearly the most necessary of commonplaces that encouragement is sorely wanted in life. There is very little of it; yet, as a rule, it is wholly beneficial, and it is a gift which everyone may impart.

A stretcher for carrying an injured person may be improvised out of a strong sheet or blanket and two light poles. Each side of the sheet is wound up on the pole until there is just room for a person to lie between.

To distinguish good cottons from poor ones remember that a good print or cotton leaves a very fair, straight edge when torn; the thread ends are also even. A good washing print usually has the pattern stamped well through to the wrong side.

You will find that the druggists everywhere speak well of Chamberlain's Cough Remedy. They know from long experience in the sale of it that in cases of coughs and colds it can always be depended upon, and that it is pleasant and safe to take. For sale by all dealers.

Minard's Liniment Co., Limited.

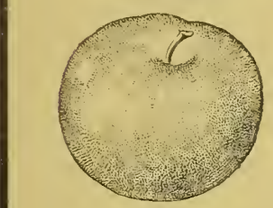
Gentlemen,—Last winter I received great benefit from the use of MINARD'S LINIMENT in a severe attack of LaGrippe, and I have frequently proved it to be very effective in cases of Inflammation.

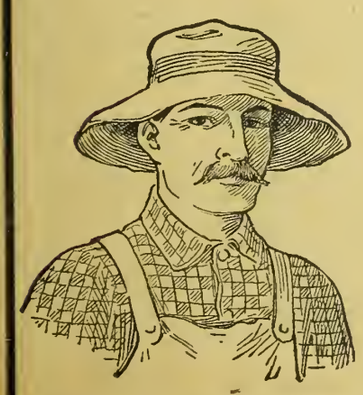
Yours,

W. A. HUTCHINSON.

Progressive Jones Says:

"It Pays Big To Fertilize The Harab Way"





THIS year I have seen scores upon scores of proofs that it pays big to fertilize the Harab way. I've seen worn out soils made to yield bumper crops and make pocket books bulge with profits. I've read oceans of letters from my farmer friends giving evidences of their success with Harab Fertilizers. What better proofs could you want, friends, than the proofs of what the Harab way has done for others.

I think you will agree with me that the Harab way is the sensible method of fertilizing. You see there are 25 different

Harab FERTILIZERS

prepared from tested, absolutely reliable formulae. Among these twenty-five different fertilizers is to be found exactly what is needed for your particular locality and for your crop you wish to raise. Harab experts give each inquiry individual attention and advice as to what fertilizer is required, based on actual tests and reports from your own district.

Harab fertilizers are being used all over Canada and are producing big results. I know the results you will get will be equally as good as the successes some of my farmer friends tell about on this page.

Harab fertilizers are mechanically mixed in exact proportions and are of the highest quality in every way. I've seen them made and I ought to know. They are manufactured from blood, bones, tankage, etc., from big Harris slaughter houses. In addition, they have Potash and just enough quick-acting Nitrates and Superphosphates to produce well-balanced Fertilizers which feed the plant as required and develop it to early maturity in a natural way. Their beneficial effect upon the soil can be felt for years after the application is made.

But, friend, what you want right now is the Harab Fertilizer booklet. It gives complete information about fertilizing the Harab way. The Harris people have promised me to mail a copy promptly to every friend of mine who writes for a copy, and to give personal advice to each inquirer. Just drop a post card to them right away.

Yours for bumper crops
Progressive Jones

Read What My Farmer Friends Say

Nanticoke, Ont., Oct. 18, 1913.
The Harris Abattoir Co., Toronto,
Dear Sirs:
Last spring we tried your Farmer's Special Fertilizer on 8 acres of Oats, and were very well satisfied with the results. It raised the average yield 10 bushels per acre over any former crop that we had raised on that field for the last eight years, and we take great pleasure in commending it for run down land.
(Signed) FRANK FLEMING.

Doubled the Corn Yield

Canard River, Ont., Sept. 8, 1913
The Harris Abattoir Co., Toronto
Dear Sirs:
I have used your fertilizers of all kinds ordered and they have proven satisfactory in every case, especially on the sweet corn, of which the yield was about double that on which there were no fertilizers. I think next season I will use double of what I used last season.
(Signed) DOLPHIS VIGNEUX.

Largest Celery Farm in Canada

Thedford, Ont., Sept. 3, 1913.
The Harris Abattoir Co., Toronto.
Dear Sirs:
Having used fertilizer on celery for the past seventeen years, wish to state that the brand we received from you last year and this spring has given us the best results of any fertilizer we have ever used. We would suggest that any gardener, who has not been fortunate enough to try your goods should do so at first opportunity, and get the best. Wishing you every success and you can feel assured that we will back you for more fertilizer next spring, we remain,
(Signed) THEDFORD CELERY CO.

Cheaper Than Horse-Manure

Walkerton, Ont., Aug. 25, 1913
The Harris Abattoir Co., Toronto.
Dear Sirs;
Your Mr. Grose called here and looked over our Strawberry field, which is beginning to show the results of your furtilizer.
We have been experimenting with an acre of Berries fertilized with 500 lbs, Harab to the acre, cost $8.50. Also an acre alongside of it with 20 loads of Horse Manure ar a cost of $2 00 per load delivered, $40.00. The plants where the Harab was used are larger and more healthy than where the manure was used, convincing us that it is much cheaper, allowing for a crop of Rape or any green crop to supply the humus which is all the fertilizer does not supply; to say nothing of the saving of lahor in hoeing the crop and keeping it clean as we find the acre with manure requires more work on account of the weed seeds which you always get in manure.
(Signed) J. E. McGREGOR.

The only Good Corn Crop

Port Hope, Aug.23, 1913
The Harris Abattoir Co., Toronto
Dear Sirs:
In answer to yours of the 15th inst. I am sending you by express a sample of Oats, grown by us this year. The soil is a gravelly loam, considered one of the poorest fields in the neighborhood.
Last year's crop was silo corn fertilized with your fertilizer at a cost of about $3.00 per acre in the drill. It was the only good corn crop in this part last year. We sowed it this spring with oats. We entered them for the county prize in the field crops. There were 15 entries from all the best farms within 20 miles. They got third place out of seven prizes, being only five points behind number one and three behind number two We fertilized the oats at a cost of $4·50 per acre and am sure we added 30 or 40% to the crops. We are prepared to furnish seed up to 200 bushels at one dollar per bushel, bags free. Hope to be able to see you at the fair.
(Signed) R. L. HOLDSWORTH & SONS.

PATRONIZE YOUR OWN LINE

The Greatest Blessing.

Doss not everyone desire the greatest of all blessings—good health. Given their birthright at the start all may continue to enjoy it through life, by carefully observing the laws of hygiene and sanitation. Intelligent people no longer ascribe sickness to "Providence," but rather to the sin of ignorance. The discoveries of science have shown that many of the fatal diseases of mankind are preventable.

Where men congregate more or less in numbers the dangers that menace health are proportionately increased, owing to sanitary neglect or ignorance. In cities and large towns sanitary affairs are controlled by public boards of health, and violations of the laws subject the individual to punishment, but in isolated country districts it is necessary for each householder to look after such matters himself, if he would enjoy good heath. Consider the following:

THE AIR WE BREATHE.

Air, fresh, pure air and plenty of it, is absolutely necessary to good health. Everyone should try at all times to secure and enjoy a maximum of the precious life sustaining element, yet many ignorantly and unnecessarily deprive themselves of as much of it as they can manage to exist without thereby rendering themselves less able to resist insidious attacks of disease.

When even that dread scourge, that fearful "white man's plague," consumption, if taken in time, can be cured by making the patient live in the fresh air all the time, it would seem that the most ignorant and stubborn ought to be convinced that only in fresh air can one seek health and only in fresh can health and bigor be maintained. As air is the material most needed by our bodies, we should always have an abundance at hand, and be sure it is of the very best quality. Many of our hours are spent indoors, and this teaches us the important lesson of airing our homes. It should also be remembered that fresh air is easier to warm than stale air.

THE VALUE OF SUNLIGHT.

Sunlight is one of the most powerful germicides known. It destroys germs and spores, and if we could carry sunlight into every corner of our houses, there would never be any need for disinfectsants. The germs of all diseases are killed by direct sunlight in six to eight hours. Thus the important lesson is taught us that well lighted rooms do not harbor contagion. Good ventilation (fresh air) and sunlight are the most important aids to a good healthf

Ideally, every house should have an entire daily bath of sun-dried air—that is, air that has been sterilized by the sun's rays. Not only should there be a free circulation of sun-near conditions which might render the air impure, such as stagnant wa' ter, decaying vegetation or animal matter, or any noxious refuse. Dampness, darkness and dirt are enemies of good health.

WE ARE LARGELY WATER.

Chemists estimate that at least two-thirds of the human body is water. As the body is continually giving out water through the skin, lungs and kidneys, it must frequently receibe a new supply to keep up the normal proportion. Therefore it is of prime importance that the water we drink cantain nothing harmful to the body. To have water is a necessity to have it harmless is of equal importance.

A pure, generous and convenient supply of water should not be considered a luxury, possibly only a few, but a necessity obtainable by all, even at the cost, if need be, or some other less important furnishing. It is stated by experts that neither looks, taste nor cleanliness can be trusted to distinguish between a safe or an unsafe water. Analysis alone can establisn that.

The danger most to be feared from drinking such water is typhoid fever. When there is any reason to suspect that the drinking nsupply is polluted, it should be boied 20 minutes after the steam bigins to rise. This will kill all germs. Another caution: Water very readily takes up gases or bacteria that may be in the air, and for this reason should not be left long uncovered when it is used for drinking. Such care is especially necessary in the sick room.—William R. Downey, M. D.

Precautions Against Diphtheria.

Diphtheria is a disease of the throat which shows itself first by the sufferer feeling ill, and complaining of aches and pains in various parts of the body, headache, loss of appetite, chilliness. At an early stage the throat feels sore with patches next appear on the tonsils, followed by the growth of white membrane, tongue dried and furred. When diphtheria is prevalent no time should be lost in calling in a medical man if there is he slightest suspicion of sore throat. Delay in so doing may prove fatal. Diphtheria is spread— (1) By contact, for example, kissing, drinking out of the same cup, using the spoon, fork, etc., or handkerchief of anyone suffering from diphtheria. (2) Milk readily conveys the disease. All milk should be boiled; any milk, beef tea, etc., left by a person suffering from the disease must be thrown away. Boil water used for drinking purposes. (3) Keep cats away. Cats readily convey diphtheria, and frequently suffer from the disease themselves. (4) Cleanse privies frequently. The emanations from foul privies may possibly, and most probably do, cause diphtheria. It is therefore most important to empty privies frequently, and not to allow night-soil to accumulate in large quantities. Sanitary pails frequently emptied and kept deodorised by the use of dry earth or fine sifted ashes are the best. Dry earth is the best deodorant. When disposing of the contents of privy or sanitary pail, always bury them about two feet below the surface of the ground in a situation where there is no risk of contaminating the well or other water supply.

Dangerous Hair Washes.

A verdict of "accidental death through burning by petrol" was returned at an inquest at Bath on the body of the wife of a motor-car driver, who was using petrol as a hairwash when it caught fire. The woman was enveloped in flames, and died very shortly afterwards.

Winter Covering for Strawberries.

"There is probably no better covering for the strawberry bed during the winter than a layer of good, clean straw of some kind, though some growers prefer to use a mulch of strawy manure. Whatever material is used, it should be sa frobm frm any used, it should be as free as possible from the seeds of grass and weeds, otherwise they will cause trouble when they come up among the plants in the spring.

"The covering should be applied after the ground becomes frozen late in the fall. and ought to be deep enough to prevent rapid freezing and thawing, say three or four inches. In this climate it is advisable to place boards, brush or poles on the mulch to hold it in place when there are strong winds.

"The main reason for covering strawberry plants is to prevent the alternate freezing and thawing of the soil duringand the oln the many of of the soil during cold nights and and warm days. When plants are not protected they are likely to have their crowns and roots injured and may die. In addition to prevention this the mulch will help retain moisture for a week or ten days. The latter is advantageous, since the killing of the blooms by the late frosts in the spring may be avoided.

"When growth begins in the spring the mulch is removed. Part of it may be worked around the crowns of the plants to form a clean bed for the fruit to rest on, thus keeping it out of the dirt. The remainder is removed to allow cultivation."

Cooking Carrots.

They must be washed and trimmed but are better not scraped before boiling, as thay lose somewhat of their flavour. The thin skin will rub off very easily after cooking by means of a clean cloth. Put into fast boiling, salted water they will take about half an hour to become tender. After draining from the water they may be returned to the saucepan with a bit of butter, and tossed over the fire for a few seconds; this is the French manner of finishing off vegetables, but it is not always appreciated by the English. A French dish of carrots is also the following:—

Boil them as above till tender then strain. Put into a saucepan 2oz. of butter and a teaspoonful of powdered sugar, when melted, put in the carrots, and allow them to practically fry. Add a half pint of broth or stock, with a dust of flour, pepper, and salt; bring to the boiling point, then serve in a vegetable dish. The carrots are better cut in two or three pieces, and young turnips may be mixed with them. This is a savoury dish for luncheon or supper.

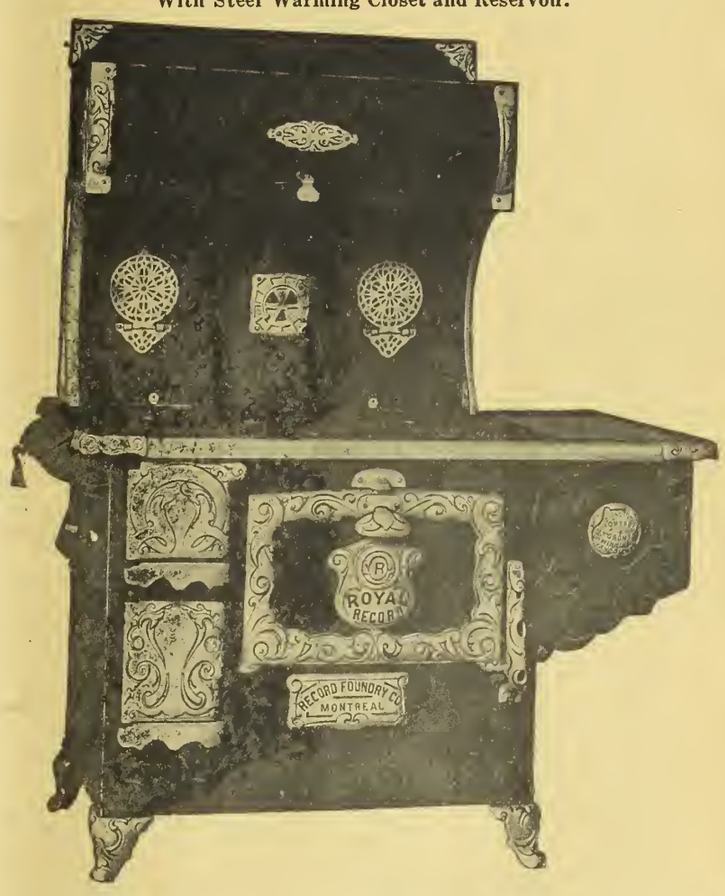
Royal Record Steel Range

With Steel Warming Closet and Reservoir.



These ranges are made from the best quality blue polished steel, lined with asbestos millboard, and reinforced with the finest quality of fire-resisting cast iron wherever necessary to protect the steel.

The trimmings are finished with the finest quality nickel-plaiting, as shown in the cut. The top is made in sections, removable anchor plate style, 50" long x 28" wide, with pouch feed and broiler door. The fire-box if fitted for coal and wood, with duplex and flat grate combined, having corrugated sectional ventilated linings. The oven, made from first quality heavy steel, asbestos-lined, and properly braced with cast iron to prevent warping. The back flue or smoke box is made of cast iron, full length, to catch soot and prevent rusting.

SATISFACTION GUARANTEED.

Dr. Morse's Indian Root Pills

exactly meet the need which so often arises in every family for a medicine to open up and regulate the bowels. Not only are they effective in all cases of Constipation, but they help greatly in breaking up a Cold or La Grippe by cleaning out the system and purifying the blood. In the same way they relieve or cure Biliousness, Indigestion, Sick Headaches, Rheumatism and other common ailments. In the fullest sense of the words Dr. Morse's Indian Root Pills are 47

A Household Remedy

Optical Legislation.

That the people of the United States are rapidly coming to a realizing sense of the great need of regulating the practice of optometry by law, the same as medicine, dentistry, pharmacy, etc. is evidenced by the fact of the State of Massachusetts which, at the last session of the Legislature, swung into line by passing an optometry bill, being the twenty-seventh State of the American union to enact such a measure.

There is little doubt that the remaining States as a matter of protection, will shortly follow suit for, as a result of the appointment of an examining Board before which all optometrical aspirants must come, and, failing to pass the required test, a horde of spectacle vendors make a speedy exit and infest the highways and byways of the rural districts of the States having no such laws.

Their modus operandi is about as follows: Travelling closely in the wake of an advance agent who, on the circus principle, goes on ahead to announce the coming of the grand show, they introduce themselves as the representatives of some wholesale optical establishment or institution which has no existance in fact, or, from purely philanthropic motives they are engaged in the laudable work of conserving the sight of the nation the price, which is usually a pretty stiff one, is only incidental, and in the megaphone tones announcing this slogan Salus Populi Suprema Lox Est.

They are the Great High Cockalorum of the feast, the Firsts Lords of the Admiralty so to speak, the only stars in the optical firament and besides them there are no others.

The prospect is then invited to produce her or his glasses. Upon acceding to this request: My dear Madam" or "Sir:" as the case may be is informed that these are only flat lenses costing practically nothing in the first place and are no good anyway." Blindness will surely ensue in the wearing of them is persisted in, and the one who urescribed them should be consigned to outer darkness."

Dr. this or Dr. that is a liar, cheat, fraud and a few other things of the same nature, and to prove that the lenses are window glass the lens measure trick is resorted to. This latter is as follows:

The lens measure is placed against a window pane when it at once registers nothing, the indicator pointing to naught. It the subject addressed has beeen wearing cylindrical correction the instrument is now placed on the piano side of said lens or, if on the opposite side, in the position in which the axis occurs when the hand will again point to zero, but if the instrument is placed at right angles to this position the full power of the lens is shown. Of course great care is taken that the instrument is not placed in this position.

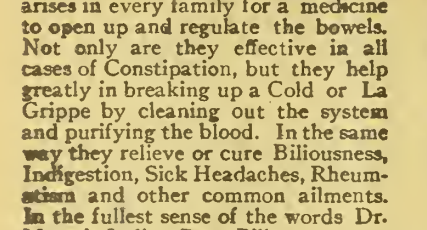
If the lenses produced for criticism are spheres or compounds, the instrument will show power on both sides, but, unless the flat lens is a very strong one, the indicator will not decircle as it will on being placed on a circle as it will on beingplaced on a toric lens of the same power at all.

To illustrate: A young lady recently called at one of my offices for examination. She was suffering from eye strain and was wearing toric lenses. On the positive side of these lenses with a great sweep registered plus 6.00; on the negative side with a similiar flourish the hand pointed to minus 6.00, now algebraically combine minus 6.00 and plus 6.00, and you have the power of the lenses that were given this young lady for the purpose of curing her headache. These were not window glass but they had the same effect on the eye that looking out of the window would.

The tactics above described usually result in an order being given for anywhere from two to four pairs of glasses, while the lenses formerly worn if at all complicated, are carried off by the operator presumably for the purpose of ascertaining the patients correction.

There success is not due to their superior knowledge of optometry, but to their ability to convince people, together with an abundant supply of nerve. They are evidently not beleivers in the Emersonian theory that if a man makes any one thing better than his neighbor, though he live in the forest, the public will make a beaten path to his door." They make the beaten path themselves to every man's door,

Occasionally, however, they meet with opposition on the part of the men who are not slow in asserting their rights to refuse to submit to an examination under pressure, and, becoming disgusted with the methods employed,—there is absolutely nothing professional about them opens wide the door and orders the performer to get sufficiently formidable boot, the peripatetic philosophers deciding that discretion is the better part of valor, stand not upon the order of their going, but get.—H. M. Harris, Specialst in Optics, Halifax, N. S.



$100 TO $200 PROFIT PER MONTH

Selling Farmers What They Need

Every farmer in Canada needs and uses our kind of goods. Over 2,000 men are making big money selling Rawleigh Quality Products, Household Remedies, Extracts, Spices, Soaps, Toilet Articles, Stock Remedies, Poultry Supplies, etc. Every article of the highest quality, well known and reliable.

We want a man at once in every locality to represent the greatest Buying, Manufacturing, Distributing and Selling Organization in North America. Established 19 years. Capital and Resources over Two Million Dollars. References, Dun's, Bradstreet's, or any bank in Winnipeg.

We offer you the opportunity to

Get Into Business For Yourself

With little competition. We are the only concern of our kind who own and operate a factory in Canada. No duty. Freight services prompt.

We want men of good standing in their community, who can furnish satisfactory bondsmen, and team for the conduct of the business. No experience required. We teach you how to handle the goods successfully and stand back of you with the services of our giant organization.

If you can meet our requirements, write for particulars of our matchless offer.

96 Henry Street
Winnipeg, Man.

PEERLESS PERFECTION
It's made right—from high grade material. In the construction of our PEERLESS FENCING we use open hearth steel wire. By this process impurities are removed from the metal, thus eliminating one of the chief causes for the rapid rusting of fence wire. PEERLESS is guaranteed to give you satisfaction. Send for catalog. Agencies nearly everywhere. Agents wanted in open territory.
THE BANWELL-HOXIE WIRE FENCE CO., Ltd., Winnipeg, Man.—Hamilton, Ont.

Description of the Bee Hive.

Many a bee keeper has ordered some hive part from a dealer in supplies and received something that he did not want. A thorough knowledge of bee hive parts as well as their names is valuable.

The hive stand is the platform or foundation upon which the hive rests this may be a brick at each corner, or several boards, or a specially made platform.

The bottom board is the floor of the hive.

The hive body is the case that holds the combs of the hive proper.

The brood frames are the wooden frames in which the brood combs are built.

The follower board of the division board is used beside the brood frames in the hive body to wedge over the brood frames and keep them snugly together.

The super is the case holding the

FREE PRIZE PUZZLE $200.00

In Cash now to be Given Away FREE, In addition to the sum of $2000.00 In Cash that we have previously Given Away.

1st Prize, $50.00 in Cash. - 3rd Prize, $35.00 in Cash
2nd Prize, $40.00 in Cash. - 4th Prize, $25.00 in Cash
5th to 9th Prizes, each $10.00 in Cash.

AND 100 VALUABLE PREMIUMS GIVEN AWAY

Below will be found six sets of mixed or jumbled letters. Can you arrange these six sets of letters in such order that each set will spell the name of a well known vegetable. It is not easy to do, but by patience can be accomplished. Try! By sending a proper arrangement you have an opportunity of winning a cash prize. Many have done this as will be shown by the names and addresses published below. Write these six words plainly and neatly on a slip of paper, as in case of ties, both writing and neatness will be considered factors in this contest.

This may take up a little of your time, but as there is **TWO HUNDRED DOLLARS** in cash and one hundred premiums given away it is worth your time to take a little trouble over this matter.

OPATOT	NIOON	BACEGAB	
NRUTPI	RACTOR	EBTE	

We do not ask You to Spend One Cent of Your Money in order to enter this Contest.

Send your answer at once; we will reply by Return Mail telling you whether your answer is correct or not, and we will send you a complete Prize List, together with the names and addresses of persons who have recently received Two Thousand dollars in Cash Prizes from us, and full particulars of a simple condition that must be fulfilled. (This condition does not involve the spending of any of your money.)

Winners of cash prizes in our late competitions will not be allowed to enter this Contest.

This Competition will be judged by two well known business men of undoubted integrity, namely, the advertising Managers of the Montreal Daily Herald and Montreal Daily La Presse, whose decisions must be accepted as final.

Below will be found a partial list of the names and addresses of a few persons who have won some of our larger prizes in recent contests. Although these persons are entirely unknown to us, they are our references. An enquiry from any one of them will bring the information that our contests are carried out with the utmost fairness and integrity. Your opportunity to win a good round sum is equally as good as that of any one else, **as all previous winners of cash prizes are debarred from entering this contest.**

Couldn't Do Housework

HEART WAS SO BAD.

Mrs Thomas Melville, Saltcoats, Sask., writes:—"I thought it my duty to write and tell you how much your Milburn's Heart and Nerve Pills did for me. My heart was so bad I could not sleep, eat, nor walk about the house. I could not do my housework at all, what my husband could not do had to go undone. I had two small children depending on me besides three men to cook for, and it worried me to not be able to do anything. My husband had taken some of your pills, some years ago, and insisted on me trying them, so I started, and before I had taken them two weeks I was considerably better, and before I had taken two boxes I was doing my own work again. Anyone suffering from heart or nerve trouble of any kind should just give your pills a trial. If anyone cares to write to me I will gladly give them all the information I know concerning your wonderful medicine."

Milburn's Heart and Nerve Pills are 50c. per box, or 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

MRS. ALVIN ZINK, Rose Bay, N. S.

States that she has been cured of

INDIGESTION

and Stomach trouble by the use of

Gates' Invigorating Syrup & Life of Man Bitters

after having been under the care of physicians without receiving benefit.

And although three years have passed has no returning symptoms.

She highly recommends these medicines to her friends and the public.

Sold everywhere at 50c. per bottle, $5.50 per dozen.

THE ORIGINAL AND ONLY GENUINE

BEWARE OF IMITATIONS SOLD ON THE MERITS OF MINARD'S LINIMENT

Minard's Liniment Co., Limited

If you are troubled with chronic constipation, the mild and gentle effect of Chamberlain's Tablets makes them especially suited to your case. For sale by all dealers.

one pound section or honey boxes. The section holders are little frames upon which the sections rest in the super.

The separators are thin slats placed between each row of sections in the super to prevent the bees from making one comb fat and another lean.

The honey board is used over the frames in winter and also over the sections in summer being always beneath the cover. All hives are not fitted with honey boards.

The bee escape board is the honey board equipped with a little tin container or trap so that when placed beneath a super of finished honey the bees can pass through it butn ot return. Honey may thus be removed without using a bee smoker.

Brood foundation is beeswax rolled into sheets for use in the brood frames. It should be used in the section honey boxes.

Surplus foundation is beeswax rolled into thin sheets for use in the sections only.

The Real Estate Situation in Nova Scotia.

The latest thing in Real Estate in Nova Scotia is McCallums' Gazette, Number Six, now being published by McCallums Limited, the well known "Real Estate Men" of Truro and Halifax.

This issue for 1914 is now in the hands of the Printers, will be completed by New Year's day and contains descriptions of over a thousand farms for sale in Nova Scotia.

The descriptions are very minute and complete and as a general rule, give the price asked and the Owner's name, so that the intending purchasers can deal direct with the actual owner.

This is an important departure from the general rule of keeping the Owner's name hidden and protects the purchaser in two very important respects.

FIRSTLY: It is an absolute guarantee that he is buying at the lowest price the property can be purchased for.

SECONDLY: When the owner allows a description of his property to be published above his own name and address, it is a pretty good guarantee that the description as advertised is a fair and truthful one, and one that he, the owner, is willing to back up.

In a day when some people's idea of advertising and exaggeration are one and the same thing, a catalogue which sticks strictly to facts, comes rather in the nature of a pleasant surprise.

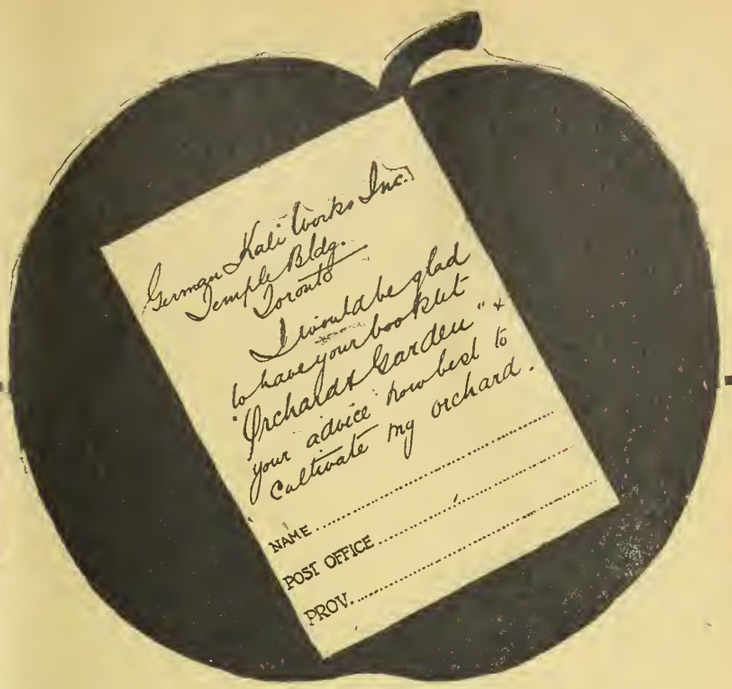
There is a marked difference in the Real Estate situation in Nova Scotia to-day, and the day when McCallums first farm catalogue was published.

Then, almost every farmer owner was anxious to sell, farm values were low, and the general feeling among farm Owners was a pessmistic one.

To-day while many are willing to sell, the general feeling is an optomistic one, and becoming more so, and while prices are still very reasonable they are stiffening from day to day.

The new catalogue is rather an attractive looking Volume of some Two Hundred pages and will be mailed to any enquirer, free on request, and it will well repay any "would be" purchaser, to look it over before buying a farm elsewhere.

A horse owner was once grumbling about how his team always kept thin no matter what tonics he gave them. A stableboy close at hand said: "Mister, did you ever try oats?" There is a suggestion here for some men we know of.



Mr. Orchardman, Use This Coupon---NOW!

A decision now as to the proper methods of cultivating and fertilizing your orchard, will mean dollars and cents to YOU next season.

NOW—after harvest—is the best time to apply fertilizers, ziz.; POTASH and Phosphoric Acid. This because the plant food in these materials, by the Winter cold and Spring thaws, wiil make the plant foods completely available by the time the sap flows in the Spring.

You need have no fear of loss by leaching.

In the world-famed Annapolis Valley the customary practise is to apply 600 lbs. Bone Meal (furnishing the Phosphoric Acid and Nitrogen), and 300 lbs. Muriate of POTASH per acre in the Fall. If you can't get Bone Meal, apply 400 to 600 lbs. per acre of Acid Phosphate or Basic Slag. The Nitrogen is supplied by plowing under clover or leguminous plants, or by applying Nitrate of Soda in the Spring.

If you prefer a factory-mixed fertilizer, be sure and get one containing at least 10 p. c. of POTASH.

The present high price of apples should impress you with the importance of improving the quality and increasing your crop. It is the best quality of fruit that demands the best prices.

If you want to learn more about cultivating and fertilizing orchards, our Scientific Bureau will be glad to advise you fully. This Bureau is composed of the very best Agricultural Experts in Canada. This advice is scientifically and agriculturally correct, and it is good.

The attached coupon makes it convenient for you to send for our "ORCHARD & GARDEN" booklet. If you will let us know your soil condition, our Scientific Bureau will tell you, without charge, how best to cultivate your own particular orchard.

Island Fruit Growers' Associations, The Maritime Stock Breeders' Association, The Maritime Bee-Keepers' Association and The Newfoundland Agricultural Board.

Volume 19. SUSSEX, NEW BRUNSWICK, DECEMBER 23, 1913. Number 6.

Thirteenth Annual Maritime Winter Fair

Ushered in by weather conditions that were not at all conducive to a large attendance, the thirteenth Annual Maritime Winter Fair opened its doors to the public on the 8th inst.

We do not know whether the eventful thirteen had anything to do with the brand of weather or not, however, rains and slush fell and winds blew on the opening and closing days, while on the two intervening days the roads were so bare, rough and hard making travel so uncomfortable that many farmer's families, who were wont to drive long distances other years remained at home.

The attendance was, however, fully up to the number that might be expected under these conditions. Visitors came from every hamlet between Sydney and Yarmouth. Prince Edward Island sent its quota. New Brunswick, too, was well represented.

All who had the privilege of attending were amply rewarded by the high ideals they saw exemplified in the live stock and seed lines as well as by the ideals set forth by the various speakers in the auditorium at the evening sessions.

THE BEEF CAttle.

Were judged by Mr. R. B. Smith, Columbus, Ontario. He worked rapidly and completed the task of judging about 100 head on Tuesday forenoon. The number of entries was a few short of last year but then there were a few specimens shown in 1912 that could have been dispersed with and leave a better average. The average quality of the stock throughout this year was excellent.

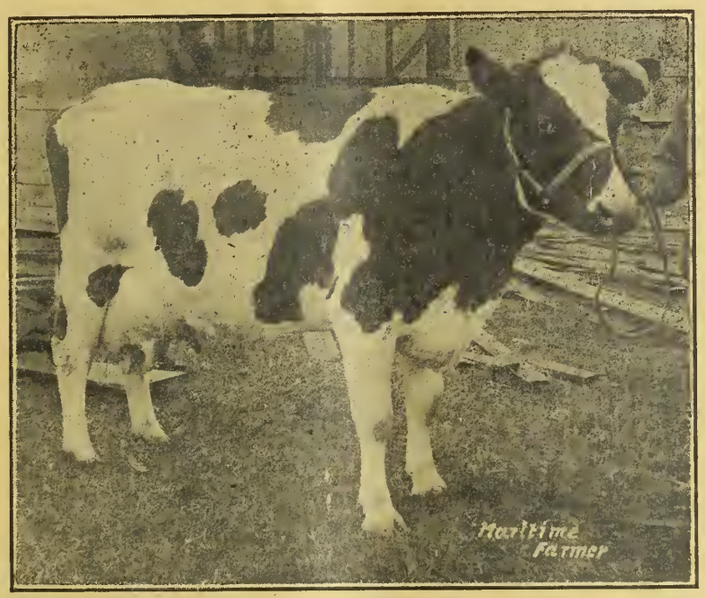
The decision of Judge Gibson in not awarding prizes to thin paunchy peaked and extremely young stuff in 1912 had the desired effect and our prediction that it would tend to fewer unfinished animals offering for prizes in the 1913 fair came true.

Shorthorns were exhibited by Harold Etter, Chas. W. Forest, Edwin Forrest, C. H. Angus, Hazen Etter, Geo. M. Holmes, N. Curry, R. A. Snowball and H. P. Lawrence.

Harold Etter's two-year-old roan steer captured the sweepstakes prize for best Shorthorn steer, any age.

The sweepstakes prize for best Shorthorn female any age went to Harold Etter's White Blossom by College Hero shown in the three-year-old or over section. White Blossom also won the silver cup donated by M. J. O'Brien, Railway contractor, Montreal, for the best Shorthorn animal, any age, cup must be won three times before becoming the property of the exhibitor. Won in 1909 by C. A. Archibald; 1910 by C. A. Archibald' 1911 by Harold Etter, 1912 by R. A. Snowball and this year by Harold Etter. White Blossom also won the International Harvester Co's. two section smoothing harrow for best beef animal, any age and the Blatchford Calf Meal prize.

A SHOW OF QUALITY.



THE HOLSTEIN COW MERCENA ARTALISSA.

Sweepstakes Cow of the 1913 Maritime Winter Fair Dairy Tests. Record—230.2 lbs. Milk; 8.01 lbs. Butter fat or an Equivalent of 9 1-3 lbs. Butter in 72 hrs. Owned by S. Dickie & Son, Central Onslow, N. S.

Photo by J. P. Landry.

THE SHORTHORN HEIFER, WHITE BLOSSOM.

Champion in the Beef Cattle Classes at the 1913 Maritime Winter Fair. Owned by Harold Etter, Westmorland Point, N. B.

Photo by J. P. Landry.

HEREFORDS AND ABERDEEN.

Cattle were shown in the same class. Since the 1912 fair W. W. Blacks fine Hereford herd was dispersed the major portion of which is now in the hands of Mr. A. Bradshaw, Amherst, who had a well-fitted entry at the fair. Edwin Forrest and E. P. Anderson also showed a few Herefords. A well-fitted trio of Doddies were shown by A. O. F. Gill, of Prince Edward Island. Gill's two-year-old Augus heifer captured the sweepstakes prize for the best animal, any age, in this class.

There was a big entry in the grade beef classes and the average fitting was very creditable. The sweepstakes grade, a son of Kenneth (Imp.) was shown in the six months and under one year section by E. P. Anderson, Sackville. This little steer also won the W. W, Black Grand Championship Silver Cup prize in the grade class. This cup must also be won three times before becoming the property of the exhibitor. As Mr. Anderson carried off this trophy in 1911, 1912 and again this year he now has it for keeps! He also won the junior section of the Blackford Calf Meal Co's. prize. The closest competitor for this honor was Thos. J. Etter's sweepstakes female also by Kenneth (imp) shown in the one year class.

DAIRY CATTLE.

The most outstanding feature of the Maritime Winter Fair is the dairy cattle Sections. Last year there were ninety entries. This year the number of cows on test was 82. The dairy tests were conducted by Messrs. Harvy Mitchell and W. A. MacKay. Following are the principal rules governing the test:—

The cows in the test shall be milked dry in the presence of the judges at 1 p. m., December 5th and the test will conclude at 1 p. m. on December 8th the percentage of fat in the milk will be determined by the Babcock [illegible] the percentage of solids not fat, by the use of the authorized formula for the purpose.

The standing of the respective cows will be computed on the following scale; 25 points for each pound of fat; 3 points for each pound of solids, not fat; 1 point for each ten days in milk after the first 30 days. Limits ten points.

No cow four years old or over shall win first prize that does not produce at the rate of 10 pounds of butter per week, or a second or any other prize that does not produce at the rate of 8 pounds of butter per week. No three year old cow shall win a first prize that does not produce at the rate of 9 pounds of butter per week, or a second or any other prize that does not produce at the rate of 7 pounds of butter per week. No heifer two years shall win a first prize that does not produce

(Continued on page 194.)

Results of the 72 Hour Dairy Test at the 1913 Maritime Winter Fair.

Book for Men, Free

8,000 Words, 30 Illustrations

TO MY READERS:

Of the little illustrated advice book described below, which I gladly send free to all men who fill in the coupon. I beg to say that it represents the very BEST information of a private nature which I am able to offer you as a result of over 30 years' observation and study of my subject, during which time I have personally interviewed many thousands of men, young and elderly, single and married, rich and poor alike, who came to me in confidence with their confessions of debility, lost nerve force and failing strength.

It is, reader, this vast and unusual opportunity which has enabled me to compile this very popular and valuable little free book (over a million of which have been sent everywhere to men who wrote me for them), and in a manner to reflect the exact living, breathing experiences and needs of real men who sought information as to the newer ways of self treatment without the use of drugs.

Remember, this book of over 8000 words and 30 illustrations will come to you by return mail in reply to your request, and in a perfectly plain, sealed envelope, for it is no one's business but your own what the envelope contains. There is absolutely no obligation on your part to buy anything or pay anything, and merely the receipt of this book which does not mean in any way that you are to use one of my VITALIZERS (see description below) and, in fact, only a portion of the book has any reference to the VITALIZER at all. Primarily it is a compendium of useful information for private reference, which you and all other men may easily profit by through life.

Therefore, please use the coupon, or if nearby, I should be very glad to have you call.

SANDEN, AUTHOR.

MANLY MEN MOVE THE WHOLE WORLD

It is a fact, reader, which you and I must recognize and admit, that the whole world admires and is fascinated by strong, vigorous, husky, manly manhood, and we must also admit that it is this same manhood and this alone which is back of the real leaders and producers in every walk of life. No matter where we go, we find it to be the manly, vigorous, vital fellow who forges to the front, who fascinates men and women of his community, who does the really great things. An unmanly man merely means nature's laws gone wrong, for it is he who halts and hesitates, who takes the back seat, who does not fit into the picture in a way that a manly, vital nature should. And yet, reader, it is my firm believe that any man, no matter what his past, no matter what dissipations or follies may have left their mark upon his physical and mental being, I say to you that such a man, unless there be some unusual reason, may hope for a complete return of his strength, vigor and self confidence, if he but go about his self restoration in a natural commonsense way.

I make a little appliance which we will call a VITALIZER, because I think that is the best word to describe its strange power. I don't want you to think of getting one of these VITALIZERS just now, but I would like you to investigate my claims as to what I believe can be accomplished by almost any weakened man who uses this VITALIZER faithfully for a few weeks. I speak, of course, of bim who is willing to give up dissipation and lead a decent, conservative life, not only while using the VITALIZER, but for the future. The other kind of man, the dissipated, can hope for nothing from any treatment, no matter what it may be, hence such a man is eliminated from my consideration.

This little VITALIZER is made to wear upon the body all night. It weighs only several ounces and is no more unhandy than any ordinary belt, yet it generates a great FORCE that I call VIGOR, which flows inio your blood organs and nerves while you sleep. Men say it often takes any pain or weakness out of the back in one application, and that 60 to 90 days' use has been sufficient to restore manly strength and to put men in the "never felt better in my life" class. Special attachments carry the FORCE of the VITALIZER to any part of the body, for the use of women as well as men in cases of rheumatism, kidney, liver, stomach, bladder, disorders, ete.

Over two hundred thousand of these VITALIZERS have been used or are now being used by men all over the world.

You had better learn more of this VITALIZER. It is fully described in my free book. If you live near me, why not call and test the VITALIZER yourself.

WHAT THE FREE BOOK TELLS

The free illustrated advice booklet mentioned above is meant to be a single declaration of certain important truths that every man in the world should know. The day has gone by when men are kept in ignorance of the real problems pertaining to these private subjects, and this illustrated advice booklet, which I send to men sealed, by mail, gives certain important facts relating to sex, just as these facts are. The booklet also fully describes my VITALIZER and you are told how you may get one for your own use if you decide that you want one. Please use coupon below, or call. Hours 9 to 6.

DR. M. F. SANDEN,
140 Yonge St., Toronto, Ont.

Dear Sirs,—Please forward me your book, as advertised, free, sealed.

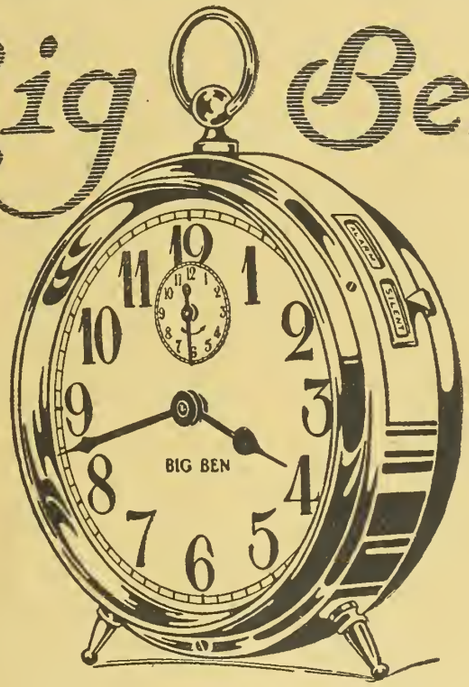
Address JOHN HALLAM, LIMITED Mail Dept. 437 111 Front St. East, TORONTO

Big Ben



Hitch Your Sleeping Schedule to Big Ben

Big Ben will wake you early enough for profitable before-breakfast action. His gentle get-up *call* starts the day with a *flying start* on thousands of farms.

For your accommodation he rings TWO WAYS. He'll get you up by degrees or in a hurry. Set him either way you wish—to give one long five-minute ring, or ten short rings at one-half-minute intervals, until you're wide awake.

He stands 7 inches tall; is triple-nickel plated over a tested implement steel coat, the handsomest and truest thoroughbred in the clock world. He has big, bold numerals and hands that show the time plainly at a glance, large keys that anyone can wind easily, and such a pleasant tone that you are glad to get up when he calls.

Big Ben makes early rising easy. He's the leader of the early morning brigade. His cheerful "good morning" ring calls millions of live wires to action. Thousands of successful farms are run on a Big Ben schedule. He starts you off right in the morning and keeps you right all day. From "Sun up" to "Lights out" he regulates your day. He'll work for 36 hours at a stretch and overtime, if necessary. The only pay he asks is one drop of oil a year.

He is sturdy and strong—built to last a lifetime. Yet under his dust-proof steel coat is the most delicate "works." That's why his on-the-dot accuracy has won him fame.

Big Ben's wonderful sales are due to his having "made good." His biggest hit has been with folks with the "make good" habit. He stands for success—that's why you'll like him for a friend.

When 3 million families find Big Ben a good clock to buy and 20,000 dealers *prove* he's a good clock to sell, it's evidence that he is worth $3.00 of *your* money. Suppose you trade $3.00 for him today.

A community of clockmakers stands back of him. Their imprint, *Made in La Salle, Illinois, by Westclox*, is the best alarm-clock insurance you can buy.

Prize Winners at the 1913 Maritime Winter Fair

BEEF CATTLE.

CLASS 1 SHORTHORNS.

Steer, 2 years old and under 3 years—1, Harold Etter, Westmorland Point; 2, Edwin Forrest, Amherst Point; 3, Chas. W. Forrest, Amherst Point.

Steer, 18 months and under 2 years—1, Edwin Forrest; 2, C. H. Angus, Carrington, N. S.; 3, Harold Etter.

Steer, 1 yr. and under 18 mos.—1, Charles W. Forrest; 2, Harold Etter.

Steer, 6 mos. and under 1 yr.—1, Hazen Etter, Westmorland Point; 2, C. H. Angus; 3, Edwin Forrest; 4, Geo. M. Holmes, Amherst; 5, Chas. W. Forrest.

Cow or Heifer, 3 yrs. or over.—1, Harold Etter; 2 and 5, N. Curry, Tidnish; 3 and 4, R. A. Snowball, Chatham.

Heifer 2 yrs. and under 3 yrs.—1, Chas. W. Forrest; 2 and 3, R. A. Snowball; 4, Geo. M. Holmes.

Heifer 18 mos. and under 2 yrs.—1, R. A. Snowball; 2, Harold Etter.

Heifer 1 yr. and under 18 mos.—1, Harold Etter; 2, Chas. W. Forrest; 3 and 4, R. A. Snowball.

Heifer 6 mos. and under 1 yr.—1, Harold Etter; 2, H. P. Lawrence Nappan Station; 3, N. Curry; 4 and 5, R. A. Snowball; 6, Chas. W. Forrest; 7, Geo. M. Holmes.

CLASS 2

Donated by M. J. O'Brien, Railway Contractor, Montreal, Silver Cup for best Shorthorn animal, any age. To be won three times, not necessarily consecutively, before becoming the property of the exhibitor. No animal can win more than one cup. Won in 1909 by C. A. Archibald. Won in 1910 by C. A. Archibald. Won in 1911 by Harold Etter. Won in 1912 by R. A. Snowball. Won in 1913 by Harold Etter.

CLASS 3

HEREFORDS, ABERDEEN-ANGUS, GALLOWS AND DEVONS.

Steer, 18 mos. and under 2 yrs.—1, A. Bradshaw, Amherst.

Steer 1yr. and under 18 mos.—1, A. Bradshaw.

Steer 6 mos. and under 1 yr.—1, 2 and 3, A. Bradshaw, Amherst.

Cow or Heifer 3 yrs. or over—1, 2 and 3, A. Bradshaw.

Heifer 2 yrs. and under 3 yrs.—1, A. O. F. Gill, Little York; 2, Edwin Forrest; 3 and 4, A. Bradshaw.

Heifer 18 mos. and under 2 yrs.—1, A. O. F. Gill; 2, A. Bradshaw.

Heifer 1 yr. and under 18 mos.—1, Chas. W. Forrest; 2, 3 and 4, A. Bradshaw; 5, Edward P. Anderson, Sackville, N. B.

Heifer 6 mos. and under 1 yr.—1 and 2, Edward P. Anderson; 3, A. Bradshaw; 4, A. O. F. Gill.

CLASS 4

GRADES OF ANY BREED.

Steer 3 yrs. old and upwards.—1, Edwin Forrest; 2, Hazen Etter; 3, Chas. W. Forrest.

Steer, 2 yrs. old and under3 yrs.—1, A. Bradshaw; 2, Edwin Forrest.

Steer 18 mos. and under 2 yrs.—1, Harold Etter; 2, Hazen Etter; 3, Charles W. Forrest; 4, C. W. Pugsley, River Herbert.

Steer 1 yr. and under 18 mos.—1, Harold Etter, 2, Hazen Etter; 3, Edward P. Anderson.

Steer 6mos and under 1 yr—1, Edward P. Anderson; 2, Thomas J. Etter, Westmorland Point; 3, Hazen Etter; 4, A. Bradshaw.

Cow 3 yrs. old and upwards—1, Edwin Forrest; 2, Hazen Etter; 3, Courtney Ludby, West Amherst; 4, Harold Etter; 5, Thomas J. Etter; 6, A. Bradshaw.

Heifer 2 yrs. and under 3 yrs.—1, Edward P. Anderson; 2, Edwin Forrest; 3, Jos. Anthony, Amherst; 4, Chas. Etter.

Heifer 18 mos. and under 2 yrs.—1, A. Bradshaw; 2, Edward P. Anderson; 3, Hazen Etter; 4 and 5, Edwin Foorest; 6, Charles Etter.

Heifer 1 yr. and under 18 mos.—1, Chas. W. Forrest; 2, Edward P. Anderson; 3, Hazen Etter; 4, Thomas J. Etter; 5, Edwin Forrest.

Heifer 6 mos. and under 1 yr.—1, Thomas J. Etter; 2, Edward P. Anderson; 3, A. Bradshaw; 4, Charles W; Forrest; 5 and 6, Edwin Forrest.

CLASS 5

DRESSED BEEF CARCASSES.

Dressed beef carcasses from animals shown in foregoing classes—1 and 2, A. Bradshaw; 3, Harold Etter; 4, C. H. Angus; 5, Edwin Forrest.

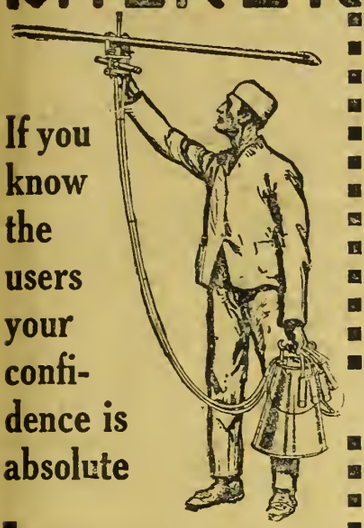
SHARPLES MILKER



If you know the users your confidence is absolute

America's shrewdest dairymen use over 6000 Sharples Milkers.

A good example is Hershey, the great chocolate man. He put a Sharples Milker in one of his many dairy barns and tried it out. Then in another barn and another and another, and he now milks twenty-one herds with the Sharples Milker.

Another user is Stephen Francisco, father of certified milk, and the livest wire on sanitary methods in the United States.

A small locality in Southern New York uses over 70 Sharples Milkers—the Province of Ontario milks 2500 cows with the Sharples and many thousands of machines are used throughout the continent.

An average operator milks thirty cows per hour, some milk forty, but we say thirty to be conservative.

It saves money, relieves the help problem nightmare, and insures more and cleaner milk by making healthier, better cows.

The Milker book is good. Send for it.

The Sharples Separator Co.

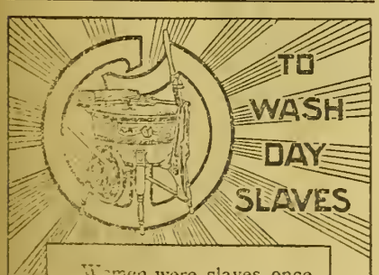
Winnipeg, Canada. Toronto, Canada.

Agencies Everywhere.



Women were slaves once. Some of them have never gotten over it, particularly on wash day.

If YOU are still bound and shackled by wash day slavery, investigate the "Playtime" Washer. Do not confuse it with the old-fashioned Washers that you have heard of. As a power machine it is specially adapted for the country where gas, gasoline, steam engine or windmill power is available.

See the "Playtime" at your dealer's or send to us for full information.

Thirteenth Annual Maritime Winter Fair

(Continued from page 185.)

at the rate of 8 pounds of butter per week, or a second or any other prize that does not produce at the rate of 6 pounds of butter per week. No heifer one year old shall win first prize that does not produce at the rate of 7 lbs. of butter per week, or second or any other prize that does not produce at the rate of 5lbs. of butter per week.

On other pages of this issue will be found a full record of each cows performance. The reader can readily ascertain by a little study of the figures given, which individuals of the respective breeds and respective ages did the best. It will also be interesting to note the variations in quantity and quality of milk of the various milkings.

The T. Eaton Co. special prize, a sulky rake, valued $23.25, for the best grade herd of milk cows went to Fowler Bros. grade Holstein herd.

The Holstein Freisian Association's sweepstakes prize of $25.00 given on the provision that the highest scoring cow, four years or over in the Dairy test is a pure bred Holstein and their Grand Championship prize of $50.00 providing that the highest scoring cow in the dairy stable is a pure bred Holstein went to S. Dickie & Sons Mercena Artalissa, shown in the four-year-old class and winning the honor of being the king pin cow of the test with a score of 259.7.

Mercena Artalassia also became the winner of the $100.00 Silver cup donated by Henry Birks & Sons, Ltd., Silversmiths and Diamond merchants, Montreal for the highest scoring cow in the Dairy Test of any breed or grade. Cup must be won three times in order to become the property of the exhibitor. Won in 1908 by W. W. Black, 1909 by Logan Bros., 1910 by T. W. Keillor, 1911 by S. Dickie & Sons, 1912 by A. McRae & Sons, 1912 S. Dickie & Sons.

The Holstein-Freisian Association-s Silver cup for the championship cow in the grade class, provided she is sired by a Holstein-Freisian bull, was captured by S. Dickie & Son's Jennie, shown in the four-year-old grade class on a score of 243.68 points. This cow also won the Amherst Trading Co's. special prize, a No. 35 Weeder and Cultivator, value $15.00 for the second highest scoring cow, any breed or grade, in the test.

The highest scoring three-year-old was F. S. Black's Roslind with a score of 211.8. 15.24 points ahead of the closest competitor, and winning the $50.00 prize offered by the Canadian Ayrshire Association providing the highest scoring three-yeah-old cow in the test is a pure bred Ayrshire. Mr. Black won the same honor last year with his Neta on a score of 206.18. He also won the same honor about nine years ago. During the intervening years it had not been taken; the three-year-old honors having gone to another breed.

The highest scoring two-year-old was S. Dickie & Son's Holstein, Grace Fayne DeKol with a score of 177.42 (7.42 ahead of the closest competitor) and winning the $25.00 prize offered by the Holstein-Freisian Association providing the highest scoring two-year-old in the test is a pure bred Holstein. The highest scoring one-year-old was W. S. Harding's Sarcastic Lass DeKol with a score of 177.78 (41.38 points ahead of her closest competitor) and winning the Holstein-Freisian Association $25.00 prize for highest scoring one-year-old in the test is a pure bred Holstein.

SHEEP.

The sheep classes were a uniform, well-fitted lot. There was not a sheep in the building of which any of the owners had any reason to feel ashamed.

The full list of awards will be found on other pages of this issue. Col. McEwen, of Byron, Ont., placed the awards.

In the dressed carcass section there were 17 entries. Jas. I. Stewart's Southdowns led the way in both sections. Oliver Saunders' Southdowns followed in second place and in section one Geo. Boswall carried off the third award.

The International Engineering Co's prizes for best four lambs, all of one breed went to Jas. I. Stewart and Geo. L. Boswall.

The Bank of Montreal Special prize for the best Oxford, Hampshire or Suffolk ewe—1, J. E. Baker & Sons. The best Cotswold or Cheviot ewe—1, Geo. Retson.

Canadian Bank of Commerce prizes for best shealing wethers—1, Jas. I. Stewart; 2, Albert Boswall, Sr.

Best four wether lambs—The New Brunswick Wire Fence Co's 40 rods fence, 1st prize—Jas. I. Stewart.

$10.00 donated by Amherst Hotel, 2nd prize—Oliver Saunders.

$6.00 donated by the Maritime Facmer, 3rd prize—Geo. L. Boswall.

The Royal Bank of Canada Special prizes for best pen—1 ewe lamb, 1 yearling ewe and ewe 2-years old—1, Geo. L. Boswall; 2, Jas. I. Stewart.

WOOL PRIZES.

Long wool la b (Hogg) fleece—1, Albert Boswall Sr.; 2, John Tweedy.

Long wool lamb (Hogg) fleece—1, Albert Boswall; 2, Geo. Retson.

Medium wool lamb (Hogg) fleece—1, Logan Bros.; 2, Oliver Saunders.

Medium wool sheep (wether) fleece—1, Cephas Nunn; 2, J. E. Baker & Sons.

Championship long wool fleece—1 and 2, Albert Boswall, Sr.

Championship sheep medium wool fleece—1,Logan Bros.; 2, Cephas Nunn.

SWINE.

were judged by Wm. Jones, Zenda, Ont. There was a big ently of well-fitted stock and competition was keen in every section.

The Dominion Swine Breeders' Association prizes for:

Best sow, 9 months and under 15 months.

Best sow, 6 months and under 9 months.

Best sow under 6 months, in each of the three Maritime Provinces were won respectively as follows:—

In Nova Scotia—1, Fowler Bros.; 2 and 3, Jas. I. Stewart.

In New Brunswick—1 and 2, T. J. Etter.

In Prince Edward Island—1 and 2, J. W. Callbeck; 3, A. A. McBeath.

The Grand Championship Silver Cup donated by the Atlas Stock Food Co., Amherst, for the best animal, any breed or grade, judged from bacon standpoint—won in 1910-11 by W. J. Gibson; won in 1912 by J. W. Callbeck and in 1913 by Peter Brodie with a six months and under nine months Berkshire.

The Percy E. Evans Silver Cup for best pen of three—sow over 1 year, sow over 6 months and sow under 6 month)—won in 1911 by A. A. McBeath; won in 1912 by Stewart Bros. and in 1913 by J.W. Callbeck with an even lot of typical Yorkshires.

There were 36 pairs of dressed swine carcasses. The red ribbon went to a pair of Peter Brodiefs Berkshires the cup winner already referred to and a barrow under 6 months.

POULTRY

There was a big entry in the poultry classes—2500 strong of which fully 500 were roosters possessing the strongest lungs and most musical voices one ever heard. A few of the matronly hens also lent their voices to the glee whenever they wanted to advertise new laid eggs. There is no room at Amherst for a poor class of birds in any section and we are glad to say that throughout the whole show there were few if any birds that would bring discredit to the fair.

The champion exhibitors of the respective breeds were there and there were few walk-overs. It was a case of quality winning throughout.

The dressed poultry department did not have quite so many entries as last year but the quality was away dp. Dreams of past Thanksgiving and future Xmas dinners floated through the minds of the visitors to the fair, as theyp aused in their rounds of inspection at the sight of the well-fitted tastily dressed birds.

BANK OF NOVA SCOTIA ESTABLISHED 1832

A Savings Account As An Investment

A savings account in the Bank of Nova Scotia is an ideal investment for three reasons. *First,* it has the most important requisite—Safety. *Second,* it is always readily available in cash. *Third,* the interest is certain, and, if you do not wish to use it, is compounded for you twice a year.

Capital and Surplus, $17,000,000.
Total Assets over $78,000,000.
Independent Outside Audit since 1906. 11

The Bank of Nova Scotia

BRANCHES OF THIS BANK in every Canadian Province, and in Newfoundland, West Indies, Boston, Chicago and New York

Royal Record Steel Range

With Steel Warming Closet and Reservoir.

These ranges are made from the best quality blue polished steel, lined with asbestos millboard, and reinforced with the finest quality of fire-resisting cast iron wherever necessary to protect the steel.

The trimmings are finished with the finest quality nickel-plaiting, as shown in the cut. The top is made in sections, removable anchor plate style, 50" long x 28" wide, with pouch feed and broiler door. The fire-box if fitted for coal and wood, with duplex and flat grate combined, having corrugated sectional ventilated linings. The oven, made from first quality heavy steel, asbestos-lined, and properly braced with cast iron to prevent warping. The back flue or smoke box is made of cast iron, full length, to catch soot and prevent rusting.

SATISFACTION GUARANTEED.

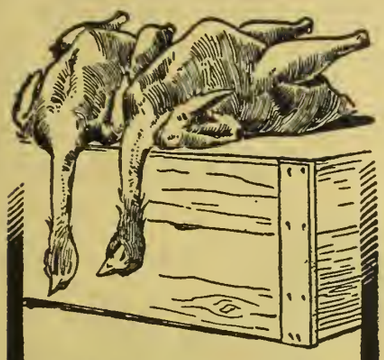
Ask your dealer for Royal Record Range, or write the

Record Foundry & Machine Co., Moncton, N.B.

Constipation

is an enemy within the camp. It will undermine the strongest constitution and ruin the most vigorous health. It leads to indigestion, biliousness, impure blood, bad complexion, sick headaches, and is one of the most frequent causes of appendicitis. To neglect it is slow suicide. Dr. Morse's Indian Root Pills positively cure Constipation. They are entirely vegetable in composition and do not sicken, weaken or gripe. Preserve your health by taking

Dr. Morse's Indian Root Pills 48



Meat-Fed Fowls Command High Prices—

Because they reach maturity earlier. This not only saves the cost of long feeding, but produces a fowl with the weight of an older bird, having firm, tender flesh and the flavor of a broiler.

In our line of the famous

Harab Poultry Foods

there are Chick Scrap, Beef Scrap, Beef Meal, Poultry Bone, Bone Meal and Blood Flour—six meat foods that practical poultrymen are now using largely. They are highly concentrated foods. A little goes a long way, therefore economical to use. A leading poultry journal states, "It requires seven pounds of skimmed milk to equal one pound of lean beef for flesh-forming qualities." That gives you some idea of the value of a meat food. A better idea will be given you when you feed Harab Meat Foods to your fowls.

Just try a sack or two. If your dealer will not supply Harab Poultry Foods, send us your order direct. Write for the latest Harab Poultry Booklet. 103

HOW TO CONQUER RHEUMATISM AT YOUR OWN HOME

If you or any of your friends suffer from rheumatism, kidney disorders or excess of uric acid causing lameness, backache, muscular pains; stiff, painful, swollen joints, pain in the limbs and feet; dimness of sight, itching skin or frequent neuralgic pains, I invite you to send for a generous **Free Trial Treatment** of my well-known, reliable **Chronicure**, with references and full particulars by mail. (This is no C. O. D. scheme.) No matter how many may have failed in your case, let me prove to you, free of cost, that rheumatism can be conquered. **Chronicure** succeeds where all else fails. **Chronicure cleanses the blood and removes the cause.** Also for a weakened, run-down condition of the system, you will find **Chronicure** a most satisfactory general tonic that makes you feel that life is worth living. Please tell your friends of this liberal offer, and **send today** for large free package, to **MRS. M. SUMMERS, Box B. 309—Windsor, Ont.**

The awards were placed by J. Fred Watson, Nashua, N. H.; F. C. Elford, Ottawa and W. H. Reid, Kingston, Ontario. J. P. Landry, of the N. S. A. C. had charge of the department and was constantly on the move to see that matters were moving along the right grooves. The full list of awards will be found on other pages of this issue and he who reads may readily see who is who in the

One of the interesting features in connection with the poultry department of the fair was an educational display was a showcase containing Branch of the Dominion Department of Agriculture. At one side of the display was a showcase containing small heaps of new copper coins representing the relative values of some of Canada's principal crops. The values of these crops were indicated as follows:

The egg crop—$23,503,000.
The barley crop—$14,606,000.
The corn crop—$14,510,800.
The fruit crop—$12,934,000.

Mr. J. H. Hare, Ottawa, was in charge of the exhibit. Associated with him was Mr. J. R. Fee, Government Egg Candling Expert, who gave egg candling demonstrations, showing the various grades of eggs found on the market:

New Laid—No. 1, No. 2. checks, leaks.

Cold Storage—lined eggs, watery eggs, black rots, red rots, green rots, musty, etc.

The egg candling booth was well patronized and the visitors who viewed the demonstration were better able to appreciate brother Hare's demonstrations on the proper and improper method of marketing eggs, given at the other side of the disvlay. This egg circle movement about which we will have something to say in a future issue seems to be the only practical solution whereby the producer will receive top notch prices and the consumer the acme of satisfaction.

APIARIAN PRODUCTS

There was a larger display of the products of the apiary than has been shown at Amherst for some time. E. L. Colpitts, Petitcodiac, placed the awards which will be found listed elsewhece in this issue.

SEED DEPARTMENT

Larger and better is still the way in which those in charge of the seed departemnt of the Winter Fair described its advance. It was hard for those who paid this branch of the show a visit to realize that seven short years ago the exhibits occupied only about one seventh of the space utilized this year, while only those who have been attending year after year and studying the exhibits carefully know that the present samples of grain competing, but outside the money would have easily been in the prize money a very few years ago.

The Canadian Seed Growers' Classes were well fillled although a few of the well known members were absent or their exhibite were lost in transit. R. D. MacKay, of Balmoral Mills, N. S. with his matchless stra'n of Red Fife won the red as usual. Another group exhibit deserving special notice was that of John A. MacDonald, Maryvale, Antigonish Co., who not only took first for white oats but also won the Cup donated by S, J. Moore, Esq., for the best selected and arranged group exhibit of white oats. Other old members exhibiting groups and all good stuff were, Donald Innis, J. H. MacKay, T. G. Wiggington, Richard Creed, Thomas Waugh, W. H .MacGregor, W. E. Palmer, E. E. Arsenault, Charles Hastings, H. R. Brown and McFarlane Bros. The latter also won the Steel Briggs Cup. Creed, Palmer, Brown, Peter Brodie, H. B. Parlee and D. C. MacNeil showed registered potatoes. Manning Chute, of Berwick, appeared with two splendid samples of Nova Scotian grown seed corn.

The beginners' class perhaps caused more comment than any other. Old members present agreed that they must look to their laurels if they are to hold their own against the selections of the sheafs with the nice even heads and bright healthy looking straw.Prominent among those were Jas. Dunn, Robert Kaulback, John W. Murray, Alex MacPherson and others with almost equally good

The children's competitions also drew out fourteen sheaves of great grain. Foremost among them were Frank Dunn, Lower Soutd River, Lawson Wood, of Hazelbrook, Margaret and Edith McFarlane, Helen Waugh and Hazel and Effe McMacstuff.

In the general competitions the exhibitors were by far too numerous to mention but a few of the best deserve notice. E. W. Bulman, E. J. Vessey, J. E. Harrison, John R. Harrison, Henry Gordon, H. P. Parlee and many others all presented samples of seed that ensures satisfaction to any one looking for a high class article.

The prize winners from the the different field crops competitions showed a full entry from Nova Scotia, while New Brunswick did not come out so strongly. The value of hand selections appeared here as it always does in field crops competitions. First in wheat going to registered grain wnile second, third and fourth went to grain produced from seed of the R. D. Mackay Red Fife strain.

A pleasing feature of the show is the increased demand for seed grain from visitors and those in charge are expectingly looking forward to the time when they will be in a position to take orders for large quantities of home grown seed.

E. D. Eddy, Ottawa and S. J. Moore, Truro, placed the awards.

The Fruit Exhibit at Amherst.

There was a good showing of apples,—wellgrown, well colored and clean, fine specimens each of ten varieties per exhibit. W. S. Blair, Supt. of the Kentville Experimental Fruit Farm placed the awards.

Following are the prize winners from each county and the varieties composing their respective exhibits. Each county's contestants placed in order of merit.

PROVINCE OF PRINCE EDWARD ISLAND.

County of Kings—Stewart Bros., Alliston, Sutton Beauty, Golden Russet, Gravenstein, Wolfe River, Mann, Pewaukee, Alexander, Ontario, Ben Davis and Stark.

County of Queens—A. E. Dewar, Charlottetown, Ribston, Wagener Gravenstein, Kings, Spy, Cox Orange Baxter, Baldwin, Alexander and Blenheim.

Geo. Dewar, Charlottetown, Cox Orange, Spy, Baxter, Mann, Wagener, Baldwin, Gravenstein, Blenheim, McIntosh Red and King.

PROVINCE OF NOVA SCOTIA

County of Annapolis—John I. Phinney, Spa Springs—Baldwin Greening, Ribston, Nonpareil, Bishop Pippin, Ontario, Spy, Ben Davis, Fallawater and King.

County of Antigonish—John Brown, West Locaber, Wealthy, Hurlburt, Pewaukee, Gravenstein, Milwaukee, Cranberry Pippin, King, Northern, Spy.

Taylor Bros., Antigonish—Canada Baldwin, Gravenstein, Wagener, Bishop Pippin, Wolfe River, King, Spy, Snow, Blenheim, Stark,

County of Colchester (3 Exhibits)—J. R. Semple, Brule—Magog, Greening, Ontario, Alexander, Winter Bough, King, Golden Russet, Ribston, Gravenstein.

Robt. Anderson, New Annan— Bethel, Winter Bough, Ribston, Bishop Pippin, Pewauukee, King, Wagener, Wolfe River, Blenheim, Alexander.

County of Pictou—John R. Fraser, Rogers Hill—Bishop Pippin, Gravenstein, McIntosh Red, King, Wealthy, Baldwin, Blenheim, Wolfe River.

K. C. Fraser, Rogers Hill—Wealthy, Blenheim, Golden Russet, Baldwin, Spy, McIntosh Red, Bishop Pippin, King, Ribston.

PROVINCE OF NEW BRUNSWICK

County of Albert—W. A. Colpitts, Mapleton—Bishop Pippin, Miliwaukee, Max Coddling, Winter Bough, Arabka, Pewaukee, Russet, Dudley, Alexander, Blenheim.

County of Kings—A. R. Gorham, Greys Mills—Ben Davis, Gravenstein, Bishop Pippin, Pomme Grise, Jenetting, Ribston, Gideon, King, Spy, Wolfe River.

County of Sunbury—1. W. Stephenson, Maugerville—Ontario, Baxter, McIntosh Red, Wolfe River, Gano, Stark, Pewaukee, Dudley Winter Princess Louise, Scott Winter.

INTERNATIONAL STOCK FOOD

Means Sturdy, Healthy Cows As Well As Good Milkers

Your cows will gain from one to three quarts of milk every day, if you add a tablespoonful of International Stock Food to the regular feed of each cow. 3 Feeds cost only 1c. But this isn't all. International Stock Food is a cattle tonic—the greatest tonic in the world for horses, cows, sheep and pigs.

It keeps cows in good health and good flesh—keeps digestion sound—invigorates the system—and helps a lot in bringing cows safely through calving. Feed International Stock Food if you want more milk this winter, healthier cows this winter, and better calves next spring. Sold by dealers everywhere, on a money-back guarantee if you are not satisfied. If you will write and tell us how many head of stock you own, we will forward to you free our $3,000. Stock Book. 104

JUDGING COMPETITION.

Dairy—1, J. C. Woodworth; 2, Harold Freeze; 3, A. L. Crosby; 8, H. A. Butler; 5, Jas. Bremner; 6, A. C. Burgess.

Beef—1, A. Illingworth; 2, E. S. Notting; 3, Jas. Bremner; 4, H. Laird; 5, J. H. Grimmer; 6, N. McLean.

Sheep.—8, A. Burgess; 2, J. H. Grimmer; 3, Thos. Douglas; 4, Jas. Bremner; 5, H. A. Butler; 6, Walter Shaw.

The Professor M. Cumming Cup for the person making the highest score in the above three sections was won by A. C. Burgess, of the N. S. A. C. with a total score of 450, seven points ahead of his closest competitor.

The M. S. B. A. Cup for the person not a regular student of an agricultural college, making the highest score in the above three secions was won by Major McRae, Charlottetown, with a score of 324.

THE STOCK BREEDERS' BANQUET.

was held in the dining hall of the fair building on the opening night. The ladies of the Amherst Hospital Aid catered to this annual event in their usual capable style.

Col. H. Montgomery-Campbell, President of the Maritime Stock Breeders' Association was at the head of the table and seated around the board were the most prominent business men of Amherst, the foremost agriculturists of Maritime Canada, the judges who had come to place the awards in the various sections of the fair and last but not least, the stock breeders were glad to welcome in their midst the Honorable Martin Burrell, Minister of Agriculture for Canada.

THE OFFICIAL OPENING

took place on Monday)vening, in the Auditorium. Col. H. Montgomery-Campbell occupied the chair. His Worship, Mayor Fage, of Amherst, extended the welcome of his town to the visitors and it was clinched for the County of Cumberland by Warden Purdy. C. L. Martin, of the Amherst Board of Trade also skoke words of welcome.

The reply to the addresses of welcome was made in behalf of the stock breeders by Hon. M. McKinnon, Commissioner of Agriculture for Prince Edward Island. The speakers following were:—Hon. M. Burrell, Hon. Josiah Wood. Hon. E. H. Armstrong, E. N. Rhodes, M. P. and Hon. D. V. Landry, Commissioner of Agriculture for New Brunswick.

The Tuesday evening meeting was presided over by Hon. M. McKinnon, when the speakers were:—W. S. Blair on "How Fruit Growing May be Made more Profitable;" E. D. Eddy on "The Importance of Seed Selection in the Development of Canadian Agriculture." Alex Hume, Menie, Ont., on "Dairy Cattle," and Hon. Mr. Burrell, who made the address of the evening. Mr. Burrill gave a resume of the work that is being done by the various branches of the department of agriculture, over which he has control. He showed a thorough grasp of the existing conditions in the various branches—a grasp which only comes by making a complete study of and an active interest in the work one an active interest in the work done and men conducting the respective branches. He set forth a plea for more co-operation in buying and selling' more education for the farmer and a more intensive system of farming.

In the absence of Mr. W. W. Black, who was, we are very sorry to say, very ill at his residence, President Montgomery-Campbell occupied the chair at

THE TUESDAY EVENING MEETING

and an appreciative audience listened to interesting addresses by:—Prof. J. M. Trueman, Agriculturist, N. S. A. C. on "The Dairy Cow and Her Food." J. J. Brown, Manager Poultry Dept., Guinn Langhole & Co., Montreal, on "Commercial Poultry Products," and E. C. Elford, Dominion Poultry Husbandman on "Poultry Business to Date."

THE CLOSING EVENING

was occupied with the distribution of special prizes and the cheers were long and loud as the various recipients stepped forward to receive the valuable, coveted trophies.

735 Bushels Potatoes Per Acre.

24th. Oct., 1913.

Editor of Maritime Farmer:—

Having some interest in the "home-mixing" of fertilizers I conducted some tests on Oat, Hay, Vetches and Cabbages during the last season and am greatly satisfied with the results. My best results were, however, obtained on Potatoes, and of these I feel proud.

I planted potatoes on three plots, fertilized as follows:

Plot 1. at the rate of 40 tons Barnyard manure per acre.

Plot 2. at rate of 40 tons Barnyard manure and 400 lbs. Basic Slag per acre.

Plot 3. at rate of 40 tons of Barn yard manure, 400 lbs. Basic Slag and 160 lbs. Sulphate of Potash per acre.

At harvest Plots 1 and 2 did not show anything out of the ordinary, just an ordinary, good yield. On digging Plot 3 I found the yield was remarkable. I dug the tubers at various parts of the plot with the same results. I called over some neighbors, who were amazed at so many tubers from such small sections of the plot. After completing the digging operations on the plot my neighbors and myself figured that the plot yielded tubers at the rate of 735 bushels per acre. Drillls were 2½ feet apart and there were very few small potatoes.

Robert D. Wilson,
Little Bras d'Or,
C. B., N. S.

FLORICULTURE.

O. L. R., of St. John, writes:—I have a sword fern that is shedding its fronds also Maiden Hair and Scotch Ferns the fronds of which turn brown and die. O. L. R. also asks—Cultural directions for ferns and acacias also cure for small white worms in the soil of house plants and requests answers in the Maritime Farmer.

There may be several reasons for your Sword Fern shedding its fronds such as:—If the drainage is stopped and it has too much moisture—If kept to dry, or if crowded with roots needing repotting or if kept in too low a temperature. One of these is probably the cause. Turn out the ball of soil, and examine it. The Scotch and Maiden Hair ferns probably have not been kept moist enough. The Maiden Hair espccially suffers in dry, hot unless the foliage is sprayed frequently.

Full directions for growing all ferns is difficult to give as the genera embraces tropical forms, requiring heat and moisture and colder forms which would perish under the treatment needed for the former; but for the varieties which are usually kept in houses the needs are:—Perfect drainage, a rich soil, (rotted sod from light soil is best) keep on the moist side in watering not letting the top side of the pot dry, partial or complete shade from the sun, a moist air of frequent spraying if in a dry place and a temperature of 50 up to 75 degrees in the day time will suit the most common species.

Acacias need good drainage, good light soil, well watered when growing plenty of sunlight, a temperature of not less than 50 degrees at night, a good spraying occasinally does them good. Repot as soon as the pot is crowded with roots or feed well to keep them improving. If kept cool in winter and on the dry side when watering they will go through the winter without much care but will lose some of the foliage.

The small white worms are probably young earth worms and can be expelled by pouring in a good dose of lime water followed in an hour or so after by a watering of clean water. To make lime water for tnis purpose slack half a pound of quick lime in a gallon of water; drain off and use the water that remains after the lime settles. This will keep a good long time if stopped up from the air in filled bottles.

Keep an eye to your bulbs now. Don't let them get to high in the cellar.

A correspondent writes to know what is the best fertilizer to use for chrysanthemum, never recommend artificial manures for amateurs although undoubtedly there are many of value if one understands using them; but I would prefer in all cases to use a strong solution of cow manure; do not water more frequent lv than twice a week and do not use after blooms are developed.

MR. FARMER:

Your Crops *Need* The Best *Fertilizer* There Is

They can have it if *You* ask for it.
It is manufactured at

WINDSOR, Nova Scotia

in the largest---best equipped---and most up-to-date Fertilizer Factory in Canada.

May all the bells of Christmas
For you at Christmas chime;
May all the peace of Christmas,
May all the Christmas cheer,
May all the love of Christmas
Be yours through all the year.

Instructors at the Short Course

Those who attend the next Short Course in Agriculture at Truro Jan. 6 to 16 will have an opportunity to meet and listen to some of the best known agricultural experts in Canada. In addition to the members of the College Staff, whose names are so well known to the people of the Maritime Provinces, the following are some of the experts who will assist in the Course:

Dr. F. M. Torrance, Veterinary Director General of Canada, whose adminstration concerns particularly the health of animals, will be at the College on Jan. 14 and 15. He is the man best qualified in all Canada to give advice in regard to tuberculosis and other diseases in stock and also to advise Municipal authorities in reference to the control of milk and meat supplies, etc.

F. T. Shutt, Dominion Agricultural Chemist, from the Central Experimental Farm Ottawa will lecture on the chemistry of the soil, manures and fertilizers. No man in Canada knows more about fertilizers or can give more information in regard to the analysis of soils, fertilizers, etc.

T. G. Raynor, B. S. A., will be the lecturer and demonstrator on Seeds and Crops. He is one of the oldest graduates of Guelph, has for years been engaged in farming and is now one of the Dominion Government Inspectors of Seed. Those who read replies in the Agricultural papers of Canada to questions asked upon various phases of field agriculture must be familiar with the initials T. G. R. If you meet him at Truro, you will appreciate his answers and contributions to the press very much more.

P. J. Carey, will be the demonstrator in fruit packing. He is the best practical expert at least in Eastern Canada. He knows how fruit should be packed and he can do the work and will teach interested students how to do it. Carey is also a practical farmer and can give much valuable advice in the growing of fruit, vegetables, etc.

F. C. Elford, Dominion Poultry Husbandman will assist in the Poultry instruction. Mr. Elford was formerly professor of Poultry Husbandry at MacDonald College and after employment for some time with one of the largest commercial firms in the United States, has now assumed the most important position in connection with poultry raising in Canada. He is well known to many Maritime Province poultry enthusiasts who will appreciate the opportunity of receiving technical instruction from him.

Good roads wil have an able exponent in W. A. MacLean, Highway Engineer from Ontario, who is generally admitted to be without a peer in his knowledge of highway construction and of methods of administering road politics. It would be a great thing for Nova Scotia if every citizen of the Province could receive instruction from him. He will bring with him models and will illustrate his evening talks with lantern views.

Besides these men a number of the leading local authorities from the Maritime Provinces, including Saxby Blair, Superintendent of the Experimental Farm, Kentville; R. Robertson, formerly of Nappan but now of Charlottetown, P. E. I.; W. W. Baird, recently appointed Superintendent of the Experimental Farm, Nappan; C. W. McDougall, Dairy Superintendent for New Brunswick, and others will be present and assist in the instruction work.

In connection with the Ladies Short Course which is to be held at the same time, Mrs. Laura Rose Stevens will be one of the lectureses and demonstrators. No one has done more than she has to improve dairying in Nova Scotia and she is known from coast to coast as one of the best lady experts in dairying domestic science, etc. in Canada. She edits the Home Column in several of Canada's leading Agricultural papers and is the author of a text book on Farm Dairying. Several others will assist in this course whose names we are not yet in a position to publish but the whole course will be at least as attractive as the Men's Short Course and should attract ladies from all over the Maritime Provinces.

This Short Course at Truro is provided free of any cost and the only expense the students will be under will be their railway fare at excursion rates and their board while in Truro. Write Principal Cumming for circulars giving detailed information.

POTASH

Increases Quantity

Improves Quality

Promotes Maturity

Produces Profit.

Potash is an essential Plant Food and no soil will yield a bumper crop that does not contain an available supply of this ingredient sufficient for the crop's needs.

Farmers who mix their fertilizers on the farm can obtain **Potash** in the highly concentrated forms of

Muriate of Potash and Sulphate of Potash

from the leading dealers and seedmen. Farmers buying ready mixed goods should insist on being supplied with brands of a high **Potash** content.

Write us for copies of our **Free,**, educative bulletins, which include :

"The Potato Crop in Canada"

"The Principal Potash Crops in Canada"

"Fertilizing Grain and Grasses"

"Fertilizing Hoed Crops"

"Fertilizing Orchard and Garden"

"Farmer's Companion, etc. etc."

Kindly state which bulletin you require.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. adies, this department is yours. Use it to the best adv antage.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

But there was such an influence in Mr. Wickfield's old house, that when I knocked at it, with my new school books under my arm, I began to feel my uneasiness softening away. As I went up to my airy old room, the grave shadow of the staircase seemed to fall upon my douhts and fears, and to make the past more indistinct. I sat there, sturdily conning my books, until dinner-time (we were out of school for good at three); and went down, hopeful of becoming a passable sort of boy yet.

Agnes was in the drawing-room, waiting for her father, who was detained by some one in the office. She met me with a pleasant smile, and asked me how I liked the school. I told her I should like it very much, I hoped; but I was a little strange as to it first.

"You have never heen to school," I said, "have you?"

"Oh yes! Every day."

"Ah, but you mean here, at your own home?"

"Papa couldn't spare me to go anywhere else," she answered, smiling and shaking her head. "His housekeeper must be in his house, you know."

"He is very fond of you, I am sure," I said.

She nodded "Yes," and went to the door to listen for his coming up, thgt she might meet him on the stairs. But, as he was not there, she came back again.

"Mamma has been dead ever since I was born," she said in her quiet way. "I only know her picture, down stairs. I saw you looking at it yesterday. Did you think whose it was.?"

I told her yes because it was so like her self.

"PaPa says so, to," said Agnes, pleased. "Hark! that's papa now?"

Her bright calm face lighted up with pleasure as she went to meet him, and as they came in, hand in hand. He greeted me cordially; and told me I should certainly be happy under Dr. Strong, who was one of the gentlest of men.

"There may be some, perhaps—I don't know that there are—who abuse his kindness," said Mr. Wickfield. "Never be one of those, Trotwood, in anything. He is the least suspicious of mankind and whether that's merit, or whether it's a blemish, it deserves consideration in all dealings with the Doctor, great or small."

He spoke, I thought, as if he were weary, or dissatisfied with something; but I did not pursue the question in my mind, for dinner was just then announced, and we went down and took the same seats as before.

We had scarcely done so, when Uriah Heep put in his head and his lank hand at the door ,and said:

"Here's Mr. Malden hegs the favor of a word , sir."

"I am but this moment quit of Mr. Malden," said his Master.

"Yes, sir," returned Uriah; "but Mr. Malden has come back, and he begs the favor of a word."

As he held the door open with his hand, Uriah looked at me, and looked at Agnes, and looked at the dishes, and looked at the plates, and looked at every object in the room I thought,—yet seemed to look at nothing; he made such an appearance all the while of keeping his red eyes dutily on his master.

"I beg your pardon. It's only to say, on reflection," observed a voice behind Uriah, as Uriah's head was pushed away, and the speaker's substituted—"pray excuse this intrusion—that as it seems I have no choice in the matter, the sooner I go abroad the better. My cousin Annie did say, when we talked of it, that she liked to have her friends within reach rather than to have them banished, and the old Doctor—"

"Doctor Strong, was that?" Mr. Wickfield interposed, gravely.

"Doctor Strong of course," returned the other; "I call him the old Doctor; it's all the same you know."

"I don't know," returned Mr. Wickfield.

"Well, Doctor Strong," said the other. "Doctor Strong was of the same mind, I believed. But as it appears from the course you take with me that he has changed his mind, why there's no more to be said, except that the sooner I am off, the better. When a plunge is to be made in the water, it's of no use lingering on the bank."

"There shall be as little lingering as possibe, in your case, Mr. Malden, you may depend upon it," said Mr. Wickfield.

"Thank'ee," said the other. "Much obliged. I don't want to look a gift horse in the mouth , which is not a gracious thing to do; otherwise, I dare say, my cousin Annie could arrange it in her own way. I suppose Annie would only have to say to the old Doctor—"

"Meaning that Mrs. Strong would only have to say to her husband—do I follow you?" said Mr. Wickfield.

"Quite so," returned the other, —"would only have to say that she wanted such and such a thing to be so and so; and it would be so and so, as a matter of course."

"And why as a matter of course, Mr. Malden?" asked Mr. Wickfield, sedately eating his dinner.

"Why, because Annie's a charming young girl, and the old Doctor—Doctor Strong, I mean—is not quite a charming young boy," said Mr. Jack Malden, laughing. "No offence to anybody, Mr. Wickfield. I only mean that some compensation is fair and reasonable in that sort of marriage."

"Compensation to the lady, sir?" asked Mr. Wickfield gravely.

"To the lady sir," Mr. Jack Maldon answered, laughing. But appearing to remark that Mr. Wickfield went on with his dinner in the same sedate, immovable manner, and that there was no hope of making him relax a muscle of his face, he added:

"However, I have said that I came back to say, and, with another apology for this intsusion, I may take myself off. Of course I shall observe your directions, as considering the matter as one to be arranged between you and me solely, and not to be referred to, up at the Doctor's."

"Have you dined?" asked Mr. Wickfield, with a motion of his hand towards the table.

"Thank'ee. I am going to dine," said Mr. Maldon, "with my cousin Annie. Good-bye!"

Mr. Wickfield, without rising, looked at him thoughtfully as he went out. He was rather a shallow sort of young gentlemen, I thought, with a handsome face, a rapid utterance, and a confident bold air. And this was the first I ever saw of Mr. Jack Maldon, whom I had not expected to see so soon, when I heard the Doctor speak of him that morning.

When we had dined, we went upstairs again, where everything went on exactly as on the previous day. Agnes set the glasses and decanters in the same corner, and Mr. Wickfield sat down to drink, and drank a good deal. Agnes played the piano to him, sat by him, and worked and talked, and played such games as dominoes with me. In good time she made tea; and afterwards, when I brought down my books, looked into them, and showed me what she knew of them (which was no slight matter though she said it was), and what was the best way to learn and understand shem. I see her with her modest, orderly, placid manner, and I hear her beautiful calm voice, as I write these words. The influence for all good, which she came to exercise over me at a later time, hegins already to decend upon my breast. I love little Em'ly, and I dont love Agnes—no, not at all in that way—but I feel that there are goodness, peace, and truth, wherever Agnes is, and that the soft light of the colored window in the church, seen long ago, falls on her always, and on me when I am near her, and on everything around.

The time having come for her withdrawal for the night, and she having left us, I gave Mr. Wickfield my hand, preparatory to going away myself. But he checked me and said:" Should you like to stay with us, Trotwood, or to go elsewhere?"

"To stay," I answered, quickly.

" You are sure?"

" If you please. If I may!"

"Why, it's but a dull life that we lead here, boy, I am afraid," he said.

"Not more dull for me than Agnes, sir. Not dull at all!"

" Than Agnes," he repeated, walking slowly to the great chimney-piece, and leaning against it. "Than Agnes!"

He had drank wine that evening (or I fancied it), untill his eyes were bloodshot. Not that I could see him now, for they were cast down, and shaded by his hand; but I had noticed them a little while before.

"Now I wonder," he muttered, "whether my Agnes tires of me. When should I ever tire of her! But that's different, that's quite different."

He was musing, not speaking to me; so I remained quiet.

"A dull old house," he said, "and a monotonous life; but I must have her near me. I must keep her near me. If the thought that I might die and leave my darling, or that my darling may die and leave me, comes like a spectre, to distress my happiest hours, and is only to be drowned in—"

He did not supply the word; but pacing slowly to the place where he had sat, and mechanically going through the action of pouring wine from the empty decanter, set it down and paced back again.

"If it is miserable to bear when she is here," he said, "what would it be, and she away? No, no, no. I cannot try that."

He leaned against the chimney-piece, brooding so long that I could not decide whether to run the risk of disturbing him hy going, or to remain quietly where I was, until he should come out of his reverie. At length he aroused himself, and looked about the room until his eyes encountered mine.

"Stay with us, Trotwood, eh?" he said in his usual manner, and as if he were answering something I had just said. "I am glad of it. You are company to us both. It is wholesome to have you here. Wholesome for me, wholesome for Agnes, wholesome perhaps for all of us."

"I am sure it is for me, sir," I said. "I am so glad to be here."

"That's a fine fellow!" said Mr. Wickfield. "As long as you are glad to be here, you shall stay here." He shook hands with me upon it, and clapped me ontheback, and told me that when I had anything to do at night after Agnes had left us, or when I wished ta read for my own pleasure, I was free to come down to his room, if he werethere, and if I desired it for company's sake, and to sit with him. I thanked him for his consideration; and. as he went down soon afterwards, and I was not tired, went down too, with a book in my hand, to avail myself, for half-an-hour, of his permission.

But, seeing a light in the litte round office, and immediately feeling myself attracted towards Uriah Heep,

We wish our Readers
one and all
A Merry Christmas
and Happy New Year.

A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. Write to-day. Address: Mrs. M. Summers, Box. . 309 Windsor, Ont.

who had a sort of fascination for me, I went in there instead. I found Uriah reading a great fat book, with such demonstrative attention, that his lank fore-finger followed up every line as he read, and made clammy tracks along the page (or so I fully believed) like a snail.

"You are working late to-night, Uriah," I said.

"Yes, Master Copperfield," said Uriah.

As I was getting on the stool opposite, to talk to him more conveniently, I observed that he had not such a thing as a smile upon him, and that he could only widen his mouth and make two hard creases down his cheeks, one on each side, to stand for one.

"I am not doing office-work, Master Copperfield," said Uriah.

"What work, then?" I asked.

"I am improving my legal knowledge, Master Copperfield," said Uriah. "I am getting through Tidd's Practice. Oh, what a writer Mr. Tidd is, Master Copperfield!"

My stool was such a tower of observation, that as I watched him reading on again after this rapturous exclamation, and following up the lines with his forefinger, I observed that his nostrils, which were thin and pointed, with sharp dints in them, had a singular and most uncomfortable way of expanding and contracting themselves; that they seemed to twinkle instead of his eyes, which hardly ever twinkled at all.

"I suppose you are quite a great lawyer?" I said, after looking at him for some time.

"Me, Master Copperfield?" said Uriah. "Oh, no! I'm a very humble person."

It was no fancy of mine about his hands. I observed; for he frequently ground the palms against each other as if to squeeze them dry and warm besides often wiping them, in a stealthy way, on his pocket-handkerchief.

"I am well aware that I am the umblest person going," said Uriah Heep, modestly; "let the other be where it may. My mother is likewise a very umble person We live in a umble abode, Master Copperfield, but have much to be thankful for. My father's former calling was umble. he was a Sexton."

"What is he now?" I asked.

"He is a partaker of glory at present, Master Copperfield," said Uriah Heep. "But we have much to be thankful for. How much have I to be thankful for in living with Mr. Wickfield!-'

I asked Uriah if he had been with Mr. Wickfield long?

"I have been with him goin on four year, Master Copperfield," said Uriah; shutting up his bokk, after carefully marking the place where where he had left off.

"Since year after my father's death. How much have I to be thankful for, in that? How much have I to be thankful for, in Mr. Wickfield's kind intention to give me my articles, which would otherwise not lay within the umble means of mother and self!"

"Then, when your articled time is over, you'll be a regular lawyer, I suppose?" said I.

"With the blessing of Providence, Master Copperfield," returned Uriah.

"Perhaps you'll be a partner in Mr. Wickfield's business, one of these days," I said, to make myself agreeable; "and it will be Wickfield and Heep, or Heep and Wickfield."

"Oh no, Master Copperfield," returned Uriah, shaking his head, "I am much to humble for that!"

He certainly look uncommonly like the carved face on the beam outside my window, as he sat, in his humility, eyeing me sideways, with his

you should install the Right Range. Now we are safe in saying that no range sold in Eastern Canada gives such satisfaction, and hence has secured the same measure of popularity as the

ENTERPRISE MONARCH STEEL RANGE.

Since its introduction hundreds have been sold and we believe there is not a single owner of a MONARCH that would not give it her heartiest recommendation.

The Monarch will do all the work that any range can do; it cooks, bakes and heats well, and with the least expenditure of fuel.

It burns wood or coal, provides plenty of hot water, is well equipped and designed to save trouble in cleaning and operating, and is built to stand the test of hard work and wear.

Just keep it clean, and it's a delight to the eye—and the pocket—every day in the year.

Write us for illustrated circular, if your dealer does not handle this popular range.

FREE This 150 PIECE Complete Scholar's Outfit FREE

BOYS AND GIRLS, NEVER BEFORE IN CANADA HAS SUCH A GRAND PREMIUM BEEN OFFERED AND SO EASY TO GET.

READ WHAT THIS GRAND SCHOLAR'S OUTFIT CONTAINS.

1 large leather bound school bag, 1 dozen fine quality H. B. pencils, 6 steel tip pen holders, 1 dozen 292 pennibs, 50 sheets of writing paper, 1 dozen envelopes to match, 1 box of 15 water color paints with brushes and pots, 10 beautiful drawing crayons of different colors, 1 fine quality steel blade penknife, 1 large hardwood slide top pencil box, 1 complete printing outfit containing type, ink, tweezers and stamping pad, 1 twelve inch ruler, 1 large memorandum book, 1 complete dater good for five years, 1 large rubber eraser, 1 steel blade pencil sharpener, and last but not least, 1 Swiss warbler the greatest invention for imitating birds and animals.

Think of it, this scholar's complete outfit is FREE. We are determined to sell a million bottles of Rose Perfume this year, and are sparing no expense to reach this mark.

Rose Perfume is a great improvement on the old style of perfume and goes twice as far. Everybody buys it because it is so good, and a present is given away with every bottle.

We give you one of these grand scholar's outfits IF YOU WILL AGREE TO SELL ONLY 30 BOTTLES OF ROSE PERFUME AT ONLY 10c PER BOTTLE. Any boy or girl can sell 30 bottles easy. No trouble at all.

We send you the Rose Perfume free and trust you until sold. Simply send us your name and address to-day. Every girl and boy should win one of these grand scholar's outfits.

Try. If you can't sell the Rose Perfume send it back to us.

Address to-day THE ROSE PERFUME CO., Dept. S., 50 Toronto, Ont.

12 Tumors Removed Without An Operation

Silver Lake, Ont., Sept. 20, 1909.

Dear Mrs. Currah,—I am enjoying better health than I have for eight years, and I think I am entirely cured. I have none of the old symptoms. I am very grateful for my present health, and think Orange Lily is the greatest treatment for women the world knows. Its use in my case caused 12 tumors or growths of some sort to be expelled. Some were as large as a hen's egg, and others smaller, down to the size of a walnut. You may use my case in your advertisement, for it is the solid truth, and pen cannot describe all the good it has done for me. Mrs. Louise E. Bolteridge.

This letter gives an indication of the positive benefits that always follow the use of Orange Lily. It is an applied treatment and comes in direct contact with the suffering organs. It produces results from the start in all cases of women's disorders, including painful periods, falling of womb, irregularities, leucorrhoea, etc.

I will send a sample box containing 10 days' treatment absolutely free to any suffering woman who has not yet tried it if she will send me her address. Enclose 3 stamps and address MRS. FRANCES E. CURRAH, Windsor, Ont.

For Sale by Leading Druggists Everywhere.

mouth widened, and the creases in his cheeks.

"Mr. Wickfield is a most excellent man, Master Copperfield," said Uriah. "If you have known him long, youknow it, I am sure, much better than I can inform you."

I replied that I was certain he was; but that I had not known him lomg myself, though he was a friend of my aunt's."

"Oh, indeed, Master Copperfield"' said Uriah. "Your aunt is a sweet lady, Master Copperfield!"

He had a way of writhing when he wanted to express enthusiasm, which was very ugly; and which diverted my attention from the compliment he paid my relation, to the snaky twistings of his throat and body.

"A sweet lady, Master Copperfield!" said Uriah Heep. "She has a great admiration for Miss Agnes, Master Copperfield, I believe?"

I said, "Yes," boldly; not that I knew anything about it, Heaven forgive me!

"I hope you have, too, Master Copperfield," said Uriah. "But I am sure you must have."

"Everybody must have," I returned.

"Oh, thank you, Master Copperfield," said Uriah Heep, "for that remark! It is so true! Umble as I you, Master Copperfield!"

(Continued in next issue)

Santa Claus Cakes

To 2 pints gooe molasses add 1½ pints shortening, 1 lb. brown sugar, 2 tablespoons cinnamon and 1 each of allspice and cloves, 1 teaspoon soda dissolved in 1 tablespoon vinegar, 1 teaspoon each of salt and black pepper. Warm the molasses, add shortening and spices, and then enough flour to roll. Let dough stand a few days in a cool place, then roll out, and cut in fancy shapes, and bake in a moderately hot oven. Bake several weeks before Christmas, gs age improves them.—L. W. Baldwin, Deleware.

sprinkle with salt. Repeat this until all the almonds are fried, being careful not to let the fat get to hot, or the nuts will burn. Use the same precautaons as for frying doughnuts. When cold, put away in a glass fruit jar, sealed, and store in cool, dry place, to keep them nice and crisp. Prceed about the same for salted peanuts, only buy those which have not been roasted.

Dates to be Remembered

St. John Exhibition, September 5th to 12th, 1914.

Nova Scotia Provincial Exhibition Halifax, N. S., Sept. 9th to 17th, 1914.

Poultry Show, Moncton, N. B., January 13, 14, 15 and 16, 1914.

Annual Meeting Nova Scotia Fruit Growers, Kentville, January 20th, 21st and 22nd, 1914.

And peace and good will on the earth.

I know they will hark as you tell it,
Their eyes will grow tender and bright,
And each little face will be earnest
As you give them their kiss of good night.
And so, as they drift off to dreamland,
Their thoughts will not all be of play,
And I think they will not quite forget it—
The real meaning of Christmas day.
For in after years they'll remember
The truths that they learned long ago,
As told by a mother at Christmas;
And the memory will help them, I know.—G. B.

One Cent a Word Ads.

Two letters last week from one cent a word advertisers, express to the Maritime Farmer their appreciation of the gratifying results following their investments. In each case tne amount invested was trivial. But it brought profits in the way of increased prices for articles offered for sale that surprised the advertisers. While one cent a word ads. are cheap, they are wonderful little messengers. They work while you work, or while you sleep for that matter, telling your story to thousands of Maritime Farmer readers. They never remain idle for a second; so when you want to sell something or buy something or do a hundred and one other things you want the public to know about, mail your one cent a word ad. to the Maritime Farmer, Sussex. As has been observed before the results will surprise you and the profits amaze you. In like manner if you want to get something, read the little ads. They may discover for you just what you have been looking for. Cash must accompany all ads. No ad. less than 25 cents.

Love Cakes.

To every lb. powdered sugar add 6 well beaten eggs and as much flour as needed to make a stiff paste. Flavor with lemon. Roll out about ½ inch thick, and cut into cakes with a biscuit cutter. Strew the bottom of baking tin as evenly as possible with sugar and flour, then lay the cakes on this and bake in a quick oven about 10 to 12 minutes. When cold ice cakes with plaain white frosting and set them in a warm place to dry. Finish by putting a bit of jelly, or a raisin or nut in the center of each cake. If desired the edges can be finished with ornamental frosting.—Mabel Page, New Hamp shire.

Salted Almonds and Peanuts.

Shell 1 lb. almonds and remove brown skin by soaking in boiling water about 3 or 4 minutes, then dry the nuts on a twoel and drop, a few at a time, in a small saucepan containing hot olive oil, or half lard and half butter, and fry until delicately browned, stirring all the while. Remove carefully with a skimmer, drain on soft paper, and

Tell the Old Story.

O, Mothers, as Christmas approaches
How you plan for the children's delight!
But take time to gather them 'round you
At eve, in the dim firelight,
And hush for a season their chatter
Of Santa and presents and play
To tell them in words true and simple
The real meaning of Christmas day.
Oh! tell them the blessed old story
Of that first Christmas eve long ago;
Of the shepherds at watch in the meadow,
And the star and its soft, wond'rous glow;
Of the wise men who followed its guiding,
Till they came where the Baby King lay
In Bethlehem's manger so lowly,
His bed but an armful of hay.
And teach them the song of the angels
That they sang at the dear Christ Child's birth,
Of glory to God in the highest,

Fruit and Nut Sweets.

Mix and run through a food chopper 1 lb. each of figs and dates, stones removed, and 1 lb. English Walnuts, shelled and blanched. Mix with this pulp 1 lb. confectioner's sugar (not the plain powdered sugar), roll ¼ inch thick, using sugar to dredge, cut in small squares or fanciful shapes, roll in confectioner's sugar, and pack in a box with oiled paper between each layer.

Extensive Teaching in Domestic Science in New York City and Suburbs.

The problem of meeting the demand for instruction in Domestic Science by the city and country women has been solved by the introduction of Extension Teaching. Experts are engaged to meet numbers of women in convenient centres and where it is possible to arrange a series of lectures from a week to six weeks very satisfactory courses in cooking are given. The following is a report of such a course of lectures in Domestic Science under the anspices of the Brooklyn Institute of Arts and Sciences, New York York City.

APPLES AS A:FOOD.

First of this season's demonstration Lectures by Miss Barrows.

Miss Anna Barrows of Teachers' College, Columbia University, gave the first of this year's series of demonstration lectures on "The Preparation of Foods" at the Brooklyn Institute of Arts and Sciences, New City; before a large and interested audience. "Uses of Fresh Fruit" was the subject of the lecture and the apple was used to illustrate the many uses to which fruit may be put in the household.

A spicy odor of apples prevaded the lecture hall and the demonstration table was beautified with favorite varieties among which were Spitsbergs, Newton Pippins and Greenings. The history of the apple was mentioned and the popularity of some varieties over others attributed to the fact that many people bought by appearance, rather than quality. This was especially true in the case of the table apple.

The apple sauce prepared at the beginning of the lecture was now rubbed through a strainer the seeds remaining in the strainer having given an agreeable flavor to the pulp. This is an especially good method to prepare the Fall apple. The parings and seeds cooked in a little water furnish an agreeable flavor to fruits lacking an acid—when cooked in this liquid.

Apple pulp prepared in this way may be used:

1. Sweetened and served with roast pork.
2. Stiffened with gelatine, after being flavored with sugar to suit the taste with the addition of lemon juice if desired, then adding the cream for apple sponge.
3. Stiffened with cornstarch or tapioca for soup. A garnish of whipped cream is quite desirable in a fruit soup.

From this pulp Fruit Tapioca was prepared. A buttered mold was lined with tapioca and the centre filled with a mixture of tapioca and apple pulp allowing ½ cup cooked tapioca to one cup of apple pulp. This was strained and turned out of the mold for serving. Any kind of fresh, stewed or presesved fruit might be used for this. The one-half cup of tapioca was cooked in one pint of boiling water until transparent. A little salt and sugar was added and spice if desired.

Apple dumplings or the old-fashioned Dough-boy was made from a quick-bread dough. A baking powder biscuit mixture was prepared using one pint sifted flour and 3 teaspoons baking-powder, ½ teaspoon salt sifted together into which was cut 1 tablespoon of shortening. Milk or water was handled to make a stiff dough easily handled which was divided into six portions and rolled or patted into round shapes. Into three of these fold an apple cored and pared and bake or steam 45 minutes or until the apples are soft. These were placed to steam with the fruit tapioca pudding.

In paring apples it is more convenient to core before paring especially in the case of the early Fall apple which is so raided by insects. Stuff the core with chopped raisins and nuts adding a trifle of sugar and snice. The stiffing depends somewhat on the sauce served with the dumplings. These apples were folded into the remaining rounds of dough and baked in a hot oven, about the temperature for biscuit. Eery often basted with a mixture of melted butter and sugar. A short-cake mixture might be used in place of the biscuit dough, rolled out spread with apple pulp and seasoned and spiced to suit the taste or with jam, marmalade or any fruit and rolled up as for a jelly roll, cut and baked as pin-wheel biscuit.

A large Spitsberg apple was hollowed out and an equal amount of celery with a quarter of a red or green pepper added and all chopped fine. A French dressing of 1 teaspoon of peanut butter and 3 tablespoons of lemon juice flavored slightly with salt and paprika was stirred into the above mixture, the salt and lemon juice preventing the apple from turning brown. This was replaced into the hollowed apple which was garnished with whipped cream and shredded almonds and served on a crisp white and green lettuce leaf. The flavor of some apples ar inferior to others and require this dressing up.

Sliced apples on dry cake piled up with whipped cream adds maisture to the cake and gives flavor to the apple. Pared and quartered or sliced and saute'ed with sausages adds to the food value and provides an appetizing combination with meats. They might be fried in fat as potatoes.

Apples lend themselves admirably to such combinations and are quite desirable in shortening the process of cookery.

In all the above recipes different kinds of fruit may be substituted for the apple and in many cases new recipes made from old.

A Delicious Grape Juice Fruuit Cake

To one-third cup butter add ½ cup sorghum, one-third cup brown sugar, ½ cup grape juice (or ½ cup grape jelly beaten and dissolved with the same amount of boiling water), 1 egg, well beaten, a small cup raisins, ½ cup English walnut meats, ground or chopped, 1 heaping teaspoon candied orange rind, 2 tablespoons shaved citron. With 2 cups flour sift 1 teaspoon cinnamon, ½ teaspoon ginger, one-third teaspoon ground nutmeg, 1 teaspoon soda and a pinch of salt. Add to the mixture 1 tablespoon lemon extract, and bake in a moderate oven till a toothpick pushed into the middle comes out clean. Frost when cold with confectioner's sugar moistened with a little milk and flavored with maple extract. Press rows of nut meats into the icing, so that each slice will have some nuts on it.—Lavilla Macomber.

Cover the bottom of a buttered pie plate with nut meats, and pour this taffy prepared after any plain sugar or molasses taffy recipe. Thin slices of fresh cocoanut are nice with lemon taffy.

A Christmas Carol.

The moon that now is shining
In skies so blue and bright,
Shone ages since on shepherds
Who watched their flocks by night;
There was no sound upon the earth,
The azure air was still,
The sheep in quiet clusters lay
Upon the grassy hill.
But the star that shone in Bethlehem
Shines still, and shall not cease,
And we listen still to the tidings
Of glory and of Peace.—Adelaide Af Proctor.

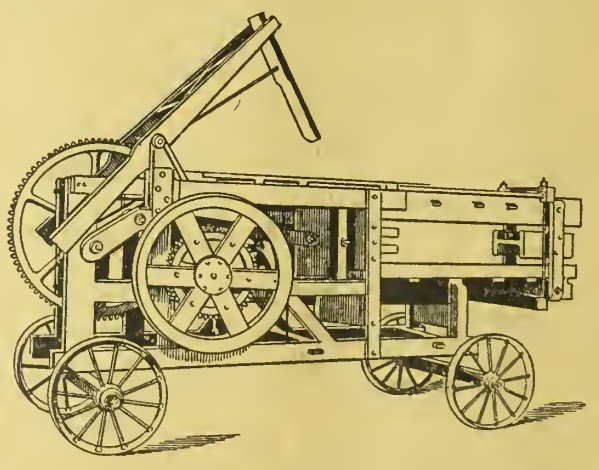
Hay Presses & Woodcutters

Our Hay Press is operated by either Steam, Gasoline Engine or Tread Power. The whole machine is so powerfully constructed that no jar is felt in any part when in operation. The Bale Box is steel lined. The Side Springs, which are thoroughlv tested, are made of the best quality of Spring Steel, The Folder is located to do perfect work, and requires but a slight spring pressure to operate.



We manufacture our Woodcutters in four different sizes and styles: two styles Long Swing, Short Swing and Flat Roller Table.

All our machines are guaranteed for a year against any defects in workmanship and material.

To Suffer From Headaches

MAKES LIFE MISERABLE.

It takes a person who has had and is subject to headache to describe the suffering which attends it. The dull throbbing, the intense pain, sometimes in one part of the head, sometimes in another, and then again over the whole head, varying in its severity by the cause which brings it on, purely indicates that there is something amiss with the system. The fact that Burdock Blood Bitters reaches the seat of the trouble is due to its success in relieving and permanently curing the cause of the headache.

Mrs. Andson, 416 15th Ave. East, Calgary, Alta., writes: "For three years I was troubled all the time with sick headaches, and suffered also with constipation, and kept breaking out in pimples and sores on my face. I tried everything till at last a friend told me of Burdock Blood Bitters. I took two bottles, and my skin is as clean and pure as a baby's, and I have never been troubled with the headaches since."

Burdock Blood Bitters is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309 Windsor, Ont.

A Des Moines man had an attack of muscular rheumatism in his shoulder. A friend advised him to go to Hot Springs. That meant an expense of $150.00 or more. He sought for a quicker and cheaper way to cure it, and found it in Chamberlain's Liniment. Three days after the first application of this liniment he was well. For sale by all dealers.

FREE THE GREATEST DOLL OUTFIT IN THE WORLD — 15 PIECES FREE

GIRLS—We want to give you the biggest, handsomest outfit of dolls and toys you have ever seen—all free to you without a cent of cost. Just look at the picture of this wonderful doll outfit and then

READ WHAT WE GIVE YOU—First, this dandy, big model, garden swing, made exactly like the fine big swings you see on millionaires' lawns, and just the finest doll-toy ever made. It holds two big dolls, so we give you with it two fine Paris beauties, dressed complete from hat to shoes in the latest fashion. Then we give you a lovely little French Bisc baby doll and the cutest gold enamel doll bed you have ever seen, complete with canopy top, mattress, spread and all. Next comes the Red Robin doll house, where you can put dolly when it rains or you don't want to play with her. It is a charming doll house and just what you will like. Last but not least, the famous Red Robin farm, with its big barn and fine, embossed horse, cow, sheep, donkey, pig, rooster and even an old hen and her little chicks. Girls, with this lovely outfit, you can give your dolls a real day in the country any time, and besides all these lovely doll presents we give you an **EXTRA PRESENT** of a fine Cleopatra Coraline Bracelet to wear yourself. It will delight you.

If you want all these grand presents, write us today and get by return of mail just 32 of our beautiful gold finished Beauty Pin sets to sell among your friends at only 10 cents each. Everybody buys two or three sets on sight because they are the prettiest and most useful Beauty Pins ever made. Just think! Two fine, fancy engraved, gold finished beauty pins on a handsome card for only 10 cents a pair. It is a pleasure to sell them. Then return our $3.20 and we will promptly send you **ALL 8 PRESENTS**, the **WHOLE 15 PIECES** and the **BRACELET** as well, just as you see them, without one cent of cost and we guarantee that you will be delighted with them. We arrange to stand payment of all charges. Don't miss this grand opportunity. Write today. Be first. Address:

Make Your Stock and Poultry Pay Better with Royal Purple

STOCK AND POULTRY SPECIFICS

At a cost of less than a cent a day per head of stock, it will increase their value 25 per cent. Permanently cures Colic, Debility, Worms, Bots and Skin Diseases. Tones up run-down animals so that they quickly gain weight and vigor. Increases the yield of milch cows three to five pounds a day, besides enriching the quality of the milk.

ROYAL PURPLE is not a food. It is a conditioner—the best ever so'd. If there was any better we would be making it. It enables your stock to eat the natural food they should eat and get the most benefit from it. Here is the advice of all thorough veterinary doctors—"Feed your stock on food of your own growing"—not pamper them with soft predigested mush so that after a time they cannot digest good, wholesome feed. Feed the good food grown on your own farm—hay, oats, bran, chop, etc. You know what these things cost you and what they will do.

ROYAL PURPLE is an aid to these natural foods and if you use it as directed, we can guarantee better results than if you feed any of the concoctions offered on the market as "prepared foods."

Try It On a Poor-Conditioned Animal

If there is a run-down, poorly nourished beast on your farm, see what **ROYAL PURPLE SPECIFIC** will do for it. A 50-cent package lasts a cow or horse 70 days. The cost is so trifling that no farmer in Canada has any excuse for having out-of-health stock around his place. Try it on the poorest-conditioned animal you have and we know you'll be surprised at the result of a short treatment. Cattle and hogs fatten up a month earlier than without it, which means you save a month's feed and a month's labor. You can bring six pigs to the pink of condition at the cost of $1.50. Steers treated in the same way cost no more than $1.00 each to put in prime state for market. **ROYAL PURPLE SPECIFIC** fattens and keeps well horses, mares, colts, cows, calves, steers, hogs. Sold in packages, 50c, and air-tight tins, $1.50.

Try ROYAL PURPLE POULTRY SPECIFIC on Your Hens

Do you know that **ROYAL PURPLE POULTRY SPECIFIC** makes hens lay in winter as well as in summer, and keeps them free from disease? It does, and helps them over the moult, fattens and keeps them in vigorous health. A 50c package lasts 25 hens over 70 days. Shouldn't you try it? We have hundreds of recommendations from all parts of the country. If **ROYAL PURPLE** does not give you better results than anything you ever used, or give you satisfaction, we will refund your money. No matter what your opinion of other preparations, we want you to give **ROYAL PURPLE POULTRY SPECIFIC** a chance to show what it can do for your poultry—and a 50c package will show you some fine results. Sold in 25c and 50c packages and $1.50 air-tight tins.

WE ALSO SELL

Royal Purple Cough Specific for cough and distemper. (Will cure any ordinary cough in four days). 50c, by mail 60c.

Royal Purple Sweat Liniment for lameness, rheumatism, sprained tendons, etc. 50c, by mail 60c.

Royal Purple Worm Specific for animals; removes the worms, also their larvae. 25c, by mail 30c.

Royal Purple Disinfectant, in 25c, 50c and $1.00 tins.

Royal Purple Lice Killer for poultry and animals. 25c and 50c, by mail 30c and 60c.

Royal Purple Gall Cure for scratches, harness scalds, open sores, etc. 25c and 50c, by mail 30c and 60c.

Royal Purple Roup Specific for roup, pip, diphtheria, typhoid fever, canker, white diarrhoea, swelled head, etc., in poultry. 25c, by mail 30c.

Free

TO STOCK AND POULTRY RAISERS

We will mail for the asking our new revised 80-page book on common ailments of stock and poultry. Tells how to feed light and heavy horses, colts, mares, cows, calves, steers, hogs; also how to feed and keep poultry so that they lay winter and summer. Cover lithographed in six colors, showing farm utility birds in their natural colors. This is a book that should be in every farmer's possession. IT'S FREE. Write for your copy today.

Oats—1, John T. Bain, Newtown, Guysboro Co.; 2, Robie Plamer, Windsor Forks, Hants Co: 3, Mark E. Rhodenizer, West Northfield, Lunenburg Co.; 4, W. G. Oulton, Lorneville, Cumberland Co.; 5, John A. McDonald, Maryvale, Antigonish Co.; 7, John L. McAuley, Grand River, Richmond Co.; 6, Patrick N. Thompkins East Margaree, Inverness Co.; 8, Murdo McGregor, Hillside, Boulardarie, Cape Breton Co.

BOYS 'TURNIP GRPWING COMPETITION.

Cumberland Co.—1, Roy Jackson; 2, Franford Oulton; 3, Russell Willis; 4, David Tulle.

Colchester Co.—1, J. R. Semple; 2, Clark Jennings; 3, Frank Crowe.

Ewing Silver Cup for best exhibit of seed grain. Won in 1911 by A. E. McLean, P. E. I.; won in 1911 by Ernest Bulman, P. E. I.; won in 1912 by E. J. Vessey, P. E. I.; won in 1913 by John R. Harrison, Maccan, N. S.

Silver Cup donated by S. J. Moore for best arranged group, exhibit of white oats—John A. McDonald, Maryvale, N. S.

COMPETITION BY MEMBERS OF THE C. S. G. A.

Spring wheat, sheaf of Red Fife, White Fife or Marquis—1, J. R. Semple, Brule, N. S.; 2, W. G. Oulton, Lorneville.

Spring Wheat, sheaf, any other variety—1, Jas. Dunn, Lower South River, N. S.; 2, Alex McPherson, Cloverville, N. S:; 3, M. B. Harrison, Athol, N. S.

White oats sheaf, any variety—1, Frank Dunn, Lower South River; 2, John R. Semple; 3, M. B. Harrison.

Six-rowed barley, sheaf—0, Jas. Dunn; 2, Thos. S. Waugh, North Bedeque, P. E. I.; 3, W. G. Oulton.

C. S. G. A. SECTION FOR NEW BEGINNERS-

Spring wheat sheaf, any variety—1, Robert Kaulback; 2, John W. Murray, Balmond Mills; 3, R. S. McCurdy, Mid. Musquodobit.

White oats sheaf, any variety—1, Robert Kaulback; 2, John W. Murray.

GROUP EXHIBITS.

Suring wheat, Red Fife, White or Marquis—1, R. D. McKay; 2, McFarland Bros.; 3, J. H. McKay; 4, Donald Innes.

Spring wheat, any other variety—1, Richard Creed; 2, Thas. S. Waugh; 3, E. E. Arsenault, Urbanville, P. E. I.; 4, W. H. McGregor, Muscouche, P. E. I.; 5, T. W. Wigginton, Bridgetwon, P. E. I.

White Oats. any variety—1, John A. MacDonald; 2, W. E. Palmer; 3, Thos. S. Waugh; 4, McFarland Bror.; 5, Harry Brown, Wallace Bay.

Blacl oats, any variety—1, Chas. Hastings, Little Shemogue; 2, E. E. Arsenault.

Six rowed barley, any variety—1, W. H. McGregor; 2, J. H. McKay; 3, E. E. Arsenault.

Peas, any field variety—1, J. C. Hogan, Amherst; 2, J. H. McKay.

Best Exhibit Seed from a multiplying field:—

Spring wheat, Red or white Fife or Marquis—1, Robert Kaulback; 2, R. H. Kennedy, Hilden.

Spring wheat any other variety—1, J as. Dunn.

White Oats—, any variety—1, McFarland Bros.; 2, Taylor Bros. Antigonish.

Six rowed barley—1, W. G. Oulton.

Best bushel of Potatoes from hand selected Seed Plot:—

Round white type—1, Peter Brodie; 2, Harry Brown; 3, H. B. Parlee; 4, D. C. McNeil, Antigonish; 5, E. Palmer.

Long white type—1, W. E. Palmer; 2, Peter Brodie; 3, Richard Creed.

Rose type—1, Peter Brodie; 2, H. B. Parlee; 3, J. H. McKay.

Best Bushel of potatoes from mother crop by new beginners:—

Ronnd white type—1, John R. Semple; 2, W. G. Oulton.

Rose Type—1, W. G. Oulton.

Steel Briggs Silver cup for most creditable showing of selected seed—Won in 1910 and 1911 by Robert McKay, Millsville, N. S., Won in 1912 by W. H. McGregor, P. E. I.; Won in 1913 byMcFarlane Bros., Fox Harbor.

BOYS AND GIRLS COMPETITION.

Wheat, any spring variety—1, Frank Dunn; 2, Margaret and Edith McFarlane, Fox Harbor: 3, Thos. S. Waugh; 4, Lawson Wood, Hazelford, P. E. I.

Oats, any white varieey—1 and 2, Margaret and Edith McFarlane; 3, Hazel L. McMackin, Butternut Ridge, N. B.; 4, Effa McMackin, Butternut Ridge.

COULD NOT STRAIGHTEN UP

For Lame Back.

Women are coming to understand that weak, lame, and aching backs from which they suffer are due to wrong action of the kidneys.

The kidneys are overtaxed—given more work that they can do, and when the back aches and pains it is almost impossible to do her housework, for every move and turn means pain.

On the first sign of any weakness in the back Doan's Kidney Pills should be taken, and thus do away with any suffering from kidney trouble.

Mrs. A. J. Lalonde, Kingston, Ont., writes:—"I am writing to tell you what a wonderful cure Doan's Kidney Pills did for me. I was suffering with a lame back, and for about seven days could hardly straighten up for the pain. I had used quite a few of other kinds of pills, and received no relief. Just then my sister came and told me about Doan's Kidney Pills, and what they had done for her, so I decided to try them. I used three boxes, and I am completely cured, and I do not hesitate to recommend them."

Price, 50c. per box, 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

If ordering direct specify "Doan's."

DISPERSION SALE CATALOGS

We make a specialty of this class of work. Send in your copy and let us arrange and print it for you.

THE MARITIME FARMER, SUSSEX, NEW BRUNSWICK.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

Make your Coal Oil Lamp Burn Gas

The New "Great White Light" Burner Turns Ordinary Kerosine Illumination Into

GASLIGHT

"ASK THE USER"

"Great White Light" Burners speak for themselves, prove their worth, make friends—
IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Light" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosine oil.

THE PROBLEM OF PERFECT COMBUSTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of Oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the Interior of the dome of the "Great White Light" Burner are the marvellous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosine oil. The discovery of the scientific action obtained by the use of the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it toward the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oxygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely diffenent, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyone, whether new or renewal subscription. When sending in money state which size you want. Send today.

We guarantee these burners to do as represented or money refunded.

The Maritime Farmer

SUSSEX, N. B.

We do not sell these burners but each subscriber may get two besides one we furnish free by sending 35 cents for each additional one wanted.

TURKEYS, GEESE AND DUCKS.

Volume 19. SUSSEX, NEW BRUNSWICK, JANUARY 13, 1913. Number 7.

Combating the Brown Tail Moth With Parisites.

Help in Restoring the Balance of Nature by Hand Picking.

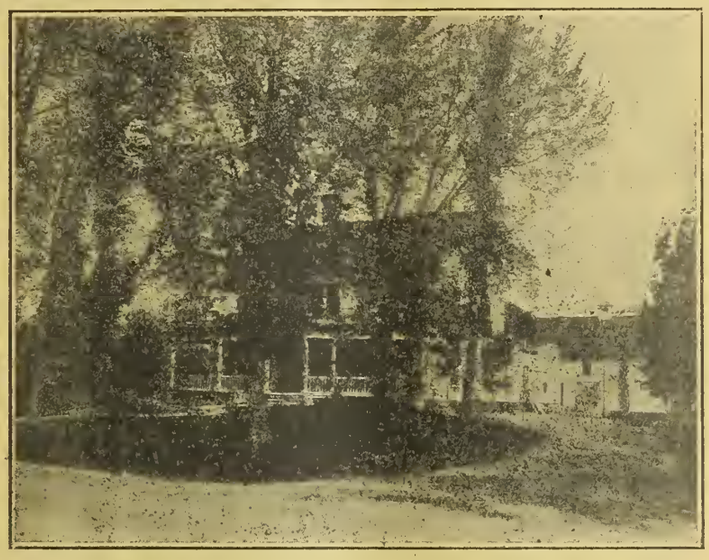
There are few if any of the readers of the Maritime Farmer who are not interested in the work that is being done both in our own provinces and in the United States for the extermination of the Brown-tail moth. Our readers will therefore be interested in reading an account of the introduction of parasites to help rid our trees of the troublesome pests as is explained in the following article by A. M. G. Soule, who has charge of the Maine State Laboratory:

The idea of importing insect enemies from one country to another is not new. Excellent work has been done in bringing to the United States enemies of scale insects, one being the very successful importation of a lady-bird beetle (Novius cardinalis) from Australia to California in 1889, which has resulted in the almost complete extermination of the fluted scale.

But when the work of introducing insects parasitic to the gypsy and brown-tail moth, to Massachusetts was begun, nothing practical had been accomplished with natural enemies of lepidopterous insects. At various times during the terrible ravages by these pests which have occurred since about 1880 in that state the question of importing natural enemies to assist in suppression was discussed by department heads in charge of the moth work. There were several reasons why the work was not undertaken before; the great initial expense for one, and another that all the work had been conducted along lines of general extermination of the gypsy moth and parasites would therefore be destroyed to a certain extent.

When, however, the amount of infested territory had grown so large that complete extermination, or even suppressions, could be accomplished only by an enormous amount of hand labor, the same conditions made it possible to establish colonies of parasites where hosts in abundance would insure a steady increase, and in 1905 the first importations were begun to that state.

The results have been so encouraging that after eight years' experience with hand work, it was considered most practical to attempt colonization of parasites to complement the hand work in Maine, and last March a laboratory for breeding parasites and for making observation on their wor. was established in Portland at 12588 Forest Avenue. A building 12x18 was built that accomodates the use of fifty feeding trays 4 feet long, 2½ feet wide and 5 inches deep, the construction and use of which will be described later in this article. Space



Residence of J. Elliott Smith, Fairview Fruit Farm, Wolfville, N. S.

is also afforded in this building for microscopic dissection and for keeping accurate notes on development and dispersion of the insects worked with.

In the work at the Maine laboratory the predaceous and parasitic enemies of the gypsy and brown-tail moths, used to breed, and liberate in the State, have been selected with great care as to thieir economic importance.

Several parasites have been imported and liberated in Massachusetts and are apparently working well, would not be practical to bring into Maine, as conditions at present would not warrant it.

The undertaking was begun only after a careful study of the relative value of the different pasasites dealt with at the U. S. laboratory and relying on the advice of the experts in charge of the parasitic work at Melrose Highlands.

The work of breeding and liberating thus far bas been with Apanteles lacteicolor and Meteorus versicolor as enemies of the brown-tail moth, Compsilura concinnata, parasitic on both gypsy and brown-tail and the Calomoma sycophanta beetle also predatory to both insects.

APANTELES LACTEICOLOR.

Apanteles lacteicolor is a very small hymenopterous fly, native to most European countries that are infested with the brown-tail moths, and those used for distribution in this country were brought from Russia, Germany and Italy.

The adult flies deposit their eggs under the skin of the newly-hatched brown-tail larvae; here they rest in the hibernating webs until spring and until the brown-tail caterpillars have reached their third or fourth moult; the maggots resulting from these eggs having received their support at the expense af the life of the caterpillar, crawl out leaving the brown-tail dead or possessed of only life enough to develop to the pupal stage. The maggot then spins its cocoon at once, rests in this form about seven days when the adult fly emerges; hosts are found in the fall web-worm and other native pests and when the brown-tail egg clusters begin hatching about August 1st, oviposition is begun on them, thus completing their several generations.

In European countries where this insect is well established it is possible to collect the cocoons in large quantities for the field and transport them to other localities. But as the Maine laboratory the following method of development was adopted.

Brown-tail webs, collected in localities known to be infested with Apanteles and Meteorus, were brought to the Maine laboratory and placed in feeding trays. These trays are made of a light wooden frame with cotton cloth bottom, the top open except for a narrow strip covered with tree tanglefoot. As the caterpillars emerged from the webs they were held in confinement by the tanglefoot and fed at once on fresh cherry leaves, or other suitable food plant. This feeding was continued at intervals of two or three hours for ten days when a section of coarse mosquito netting cut to fit the inside dimensions of the tray was spread over the refuse feed and larvae, more feed placed in the trays, thus drawing the maggot bearing larvae away from the refuse feed. After another six days this operation was repeated with similar effect. When the maggots began to emerge and spin cocoons, the sections of web bearing the refuse feed and moulting nets were transferred to the picking cage, leaving the more active caterpillars in the feeding trays.

The work of picking the cocoons from the refuse was very disagreeable and attended by great personal discomfort. The dried and partly eaten leaves, the moulting webs and all material necessary to be handled are covered with the poison spines from brown-tail hairs. To inhale this poison or acquire in the eyes is very dangerous. This disagreeable feature obviated to some extent by the use of a picking cage. This resembles an ordinary show case with top and sides of glass and at the back, holes cut, and armulets made of canvass inserted to protect the operator during process of picking. Even by this protection and by wearing rubber gloves great discomfort was experienced during this operation.

As soon as a sufficient number of cocoons were obtained they were carried into the field for colonization as quickly as possible before the adult flies had time to emerge; suitable localities having been selected by careful inspection, earlier in the season. In the field the cocoons were r in a waterproof box, this box being slightly perforated on the side, nailed to a tree, both tree and box smeared with tree tanglefoot to prevent destruction of the cocoons by ants, and here left to emerge.

In this manner colonies were liberated and about 15,000 cocoons distributed.

A sufficient number of Meteorus versicolor cocoons were also obtained to establish two colonies of this parasite, the life history of which is similiar in some respects to the Apanteles already described.

COMPSILURA CONCINNATA.

Work was then continued on Compsilura concinnata, a Tachinid fly, about as large as the house fly and unless carefully examined not unlike this common pest in appearance. In

their method of attack the Compsilura deposit beneath the skin of the host caterpillar the very small maggots which have hatched within the body of the mother; these maggots establish themselves within the alimentary canal of their host and in two weeks have attained complete larval development when they issue from the caterpillar leaving it dead. Within a few hours they develop to the pupal stage, rest in the stage a week, then the flies emerge and in two or three days the females have attained full sex maturity and are ready to begin larviposition, thus making possible a generation every month during summer.

Some maggots winter in the first stage larvae of the brown-tail and others in the state of puparia in the ground. The breeding of this parasite was accomplished in much the same manner as with the Apanteles already described. Gypsy moth larvae were collected, confined in the trays, fed on oak leaves and as the puparia developed, these were picked out and plantings made.

This insect should prove of great importance, as it will attack both the gypsy and the brown-tail moth with avidity and at least sixteen of our native insects are known to serve as its hosts. None of our native tachinid are known to have as many hosts. The cabbage butterfly and the tussock moth are readily attacked and great good may be expected to this vicinity where the tussock moth to Portland and the cabbage worm to Cape Elizabeth have at times been considered serious pests. At the time of collecting the parasite bearing larvae of the gypsy moth, the opportunity was improved to collect a number of Calosoma sycophanta beetles and two plantings were made, one within the city limits of Portland and one in the badly infested woodland of York. At the same time several hundred larvae of these beetles were collected and confined in hibernating ground cages at the laboratory, where they will be available for colonization as adults in the spring.

Calosoma syrophanta is a beetle about one inch in length and of a brilliant green color. It has long legs so it is able to get over the ground very rapidly and get into the trees after its prey. The beetles and their larvae secure their food by tearing into the caterpillars or pupae and eating the viscera found within. The beetle was first imported to Massachusetts in 1905 and the best results have been obtained from specimens received from Switzerland and Italy.

The eggs are deposited in the ground by the female beetles; from these eggs in from five to eight days the larvae hatch and begin feeding on caterpillars and pupae showing a preference for pupae. The three stages and two moultings of the larvae occupy from two to three weeks, during which time they feed in the manner already described; this feeding completed, the larvae makes its way into the ground and by burrowing forms a chamber in which to pupate; here it remains until the emergence of the beetle which begins feeding at once, thus completing the life cycle.

The average number of eggs laid in one season by the female beetle is about one hundred, although a single female has been known to lay six hundred and fifty-three eggs in a season.

Calosoma sycophanta can apparently feed on caterpillars affected with the "wilt-disease" without any ill results. The beetles have been known to live in captivity for one month and thirteen days, without food of any kind, and with natural conditions of liberty the time of fasting could be increased. Much that is good can be said of this predaceous beetle but the true parasites must not suffer by comparison. When the habits of this beetle and its larvae are observed by the average person, its usefulness is at once considered as most important, as its destructive powers are so apparent. But the work of the other parasites, as the hymenopterous flies, although not so readily observed, is fully as important from an economic standpoint.

ANASTATUS BIFASCIATUS.

Anastatus is a native of Europe and Japan and effective as a parasite there. This very small insect attacks the gypsy moth eggs before the larvae develop; the parasite eggs are laid one in each egg of the host and the maggot feeds on this, becoming fully developed in three weeks; when it rests, doing no more work until the following season. About three weeks previous to the appearance of the egg clusters, this Anastatus undergoes the change to pupa and adult and is ready to deposit eggs for another generation.

Blossom Time in J. Elliott Smith's Fair View Fruit Farm, Wolfville, N. S.

SCHEDIUS KUVANAE.

Schedius kuvanae is also an egg parasite but seems to prefer to attack the egg clusters in which the caterpillars have developed and completes a generation about every month during warm weather. Therefore two broods in the fall are possible before winter sets in. If colonies of these insects can be established the gypsy moth will have enemies for all but the imago stage.

CONCLUSION.

Whatever results may be obtained it must be observed by every owner of trees, that hand work must continue for a time at least, and a very active warfare be waged against the gypsy and brown-tail moths.

Time is needed for the predatory enemies to control the rapidly increasing infestations and assist in restoring "the balance of nature" which has been disturbed. In general no one need fear retarding or interfering with these parasites by general extermination of their hosts in orchards, and the sites selected for colonization of these parasites have been selected in localities where the moth colonies will afford abundant food for their support until they become strong and well established. It is the purpose of the department to give all information possible to interested people and their hope is that everyone interested in the examination of these moth pests will acquaint themselves with the nature of the parasites, that none may be destroyed through ignorance of the habits of these beneficial insects.

Fortunately it has been possible to secure the assistance at the laboratory during the summer, of college men (more particularly from the University of Maine), their courses in biology especially fitting them for the work, and their efforts have been greatly appreciated.

From the information obtained as to dispersion, the results of the season's work have been most encouraging and it will be the policy to breed and distribute parasit)s more extensively another season. The work of this year has proped that the building occupied and used at present is not large enough to accomodte the work contemplated for next season. A larger building possible of better ventilation, thus obviating the confinement of working among the poison spines which occasianed so much discomfort, will be built. This structure will have a capacity of two hundred trays and it is hoped with this equipment to increase the number of parasite colonies so that all the infested territory will be given protection which ought to assist hand work greatly.

What is Powdery Scab?

Several readers of the Maritime Farmer have written asking for information re the "Powdery Scab" of potatoes which has caused such a commotion among the potato growers vf the Maritime Provinces:

"CORKY" SCAB OF POTATOES.

(Spongospora subteranea Johns.)

Although the disease "Corky" scab, has part of its name in common with the ordinary scab it is in no way related, nor does it even closely resemble the common potato scab. Probably the name 'Powdery Scab,' is more appropriate for incrustations on the surface of potatoes in this disease are filled with a powdery, olive-green mass composed entirely of the spores of the fungus Spongospora. They are often present in such dense masses as to appear like the spore powder of smut fungi. The common potato scab does not alter the shape of the tuber, whereas the powdery scab frequently produced knarled, knobby tubers covered with deep sores, almost totally unfit for any purpose. The fungus, or more correctly speaking, the slime fungus (Myxomycete) belongs to the same group of organisms as that causing Club Root (Plasmodiophora) in turnips and other related plants. It produces millions of perforated spores which infest the soil and any sound tubers that may come into contact with diseased ones. The disease is widely spread in Europe, hence it affords one more reason to abstain from using imported potatoes for seed purposes. The great danger of introducing new diseases into any country should be fully realized. The examples afforded by the Late Blight of potatoes (Phytophthora infestans), which disease has also been introduced from abroad, should suffice to suppress any sceptical person of its serious importance and the responsibility of any grower who commits 'an error of judgment.' To spray potatoes, as they should be sprayed, to prevent any losses from Late Blight, costs, inclusive of labor and material, twenty-four dollars per statute acre. This expenditure, however, may save every cent of loss while spraying to prevent potato Canker and Corky Scab has been found of no value whatever.

A large quantity of imported tubers have been examined. While it must be said that some were of remarkably fine quality, there were whole consignments that showed Dry Rot, Rhizoctania, Scab, Late Blight, Sprain and Bacterial Rots to such an extent as to be useless for any purpose.

The risks involved from the introduction of new diseases are far more serious than they appear. It is not a question of injuring the crops and purses of one or more growers, but the whole industry of a nation may be seriously compromised. The sooner this question receives international attention the better, for only by international agreement will it be possible to prevent the wholesale exportation of diseased vegetation, and thus the distribution all the world over of diseases against which every country spends thousands of dollars annually in its efforts of control, but but which it shows no concern about when exporting into any other country.

The following order in council was passed last year in Canada:—

"Every person using for seed other potatoes than such as have been raised by himself must obtain, preserve and exhibit on demand, previous to planting, a certificate from the seller or his agent stating that the potatoes to be used for seed have not been imuorted from Europe."

The following provisions have been copied from the Destructive Insect studied, as any farmer or grower on whose land this Potata Canker or any Corky Scab disease is subsequent ly found will be asked to furnish evidence of the origin of the potatoes used for seed. Anybody found to have contravened the Act or any regulation will not only render himself liable to a fine or imprisonment provided under the Act, but will also forfeit the entire crop without any compensation.

"Compensation not exceeding two-thirds of the value as assessed by the inspector, of the vegetation or vegetable matter or containers thereof destroyed by the instruction of an inspector, shall be granted by the Governor in Council upon the recommendation of the Minister, except in cases where these regulations are carried out under the direction of the government of a province not granting compensation, or in the case of potatoes or potato crops."

"Every person who contravenes any provision of this Act or any regulation made thereunder, shall be liable, upon summary conviction, to a fine not exceeding one hundred dollars, or to imprisonment to a term not exceeding six months, or to both fine and imprisonment. Any vegetable matter imported or brought into Canada contrary to this Act, or to any

regulation made thereunder, shall be forfeited to the Crown."

"The owner, occupier or lessee of any premises or place where any of the insects, pests or diseases specified herein shall be found, shall immediately notify the minister, and shall also send to him specimens of such insects, pests or diseases."

Powdery Scab of Potatoes.

Quite a furore was caused in potato growing sections and shipping circles of the Maritime Provinces by the order issued by Secretary Houston, Washington, D. C., continuing the quarantine put temporarily into effect September 20th last, forbidding potato importations from the British Isles and all continental Europe.

The Secretary's action was modified, however, by a second order, under which the quarantine may be raised under proper regulation and inspection, from foreign countries or districts, including Canada, which can show that they are free from potato wart and powdery scab, the two diseases which the department ol agriculture aims to keep out of the country.

The first order became effective on December 24th, 1913 but will admit until January 15th, 19144 potatoes covered by consular invoices on or before December 24th. The second becomes effective on January 15th.

A conference on this matter was held in Washington early in December at which Mr. Geo. O'Halloran, Deputy Minsister of Agriculture and M. G .Gusson, Dominion Botanist and other representatives of the federal and local departments of agriculture were present and the modified order already referred to is the outcome of the meeting.

The export of potatoes to the United States is considerable, and if an embargo were put on it would work considerable hardship. For the past ten years, from 1902 to 1912, the average amount exported was 433,000 bushels valued at $197,000. The heaviest year was 1904, when there was a shortage in the United States when the exports totalled $1,450,000 bushels.

It is believed at Ottawa that dealers who have been trying to corner the American potato market are behind the attempt to place an embargo on Canadian potatoes.

In the case of certain provinces in Canada and certain countries and districts of Europe the officials of our agricultural departments believe the absolute prohibition can be lifted in time to allow the movement of the present year's crop, under the regulation and inspection, which, under the secretary's order, is similar to that for nursery stock.

According to a statement recently issued by the U. S. Consul for Prince Edward Island, the Island Province potatoes are free from powdery scab and other diseases on which a ban has been placed, the Island farmers feel quite confident that so far as the garden of the Gulf is concerned the embargo will be cancelled at an early date.

The New Brunswick Department is also busy trying to ascertain the correctness of the claim that some districts in New Brunswick are infested with the Powdery Scab. But so far as we are able to ascertain both Nova Scota. aad New Brunswick are free from the Powdery Scab and ere long we trust to see the bars removed that at present hinder the moving of the 1913 crop.

There is no doubt but our potato growing friends in the eastern sections of the neighboring republic will do their utmost to keep the bars at top notch and we cannot blame them if there is the least shadow of suspicion in regard to the existence of the Scab on this side of the line. However, we believe the Maritime Provinces can produce a clean hill of health that will be above all suspicion. Our farmers will then, as in the past, be allowed to enjoy the opportunities offered by the larger markets.

In the meantime it behooves every farmer to acquaint the secretary for agriculture for their province with the conditions existing in their respective localities, and il they have observed any suspicious potato diseases to help solve the problem by acquainting their agricultural departments re the facts of the case.

Following is a letter recently issued by the New Brunswick Department of Agriculture.

"This is to certify that R. P. Gorham and D. B. Flewelling are regular members of the staff of the Department of Agricu,ture in the Province, and at present are authorized to examine potatoes in every and any locality throughout the province.

"It is charged by the Government of the United States that we have the disease among our potatoes known as "powdery scab" and it is proposed to place an embargo upon the localities effected. The proposed legislation of the Government of the United States is of such a nature that it behonves the Government of this Province to made faithful endeavours to determine where the disease exists. Not only is this important in the matter of shipments to the United States, it is important for our local markets.

"If this disease becomes general througnout the Province, it will mean a large financial loss to our farmers; therefore we solicit the hearty co-operation of all the farmers and buyers in our efforts to locate this disease, and afterwards to enforce such measures as we may deem best to eradicate the same from the Province. I would call your attention to legislation passed by this Province on the 20th of March, 1313, known as "The Injurious Isect and Pest Act." Sections 5, 6, 7 and 8 of the Act are as follows:—

"Sec. 5. The Minister of Agriculture may appoint inspectors and other officers for carrying out this Act and the regulations made thereunder, and such inspector other officers so appointed shall act under his direction.

"Sec. 6. Any inspector or other officer so appointed may enter in or upon any place or premises in which there is reason to believe that any such pest or plant disease exists.

"Sec. 7. The Minister of Agriculture upon the report of any inspector as to the existence of any such insect, pest or plant disease, in any locality confined in such report, may prohibit the removal from such locality of any vegetation, vegetable or other matter, which is likely to result in the dissemination of such insect, pest or plant disease.

"Sec. 8. Any person contravening or neglecting to carry out, or offering any hindrance to the carrying out of any provision of this Act, or any regulation made thereunder, shall be liable, upon summary conviction, to a fine of not less than twenty dollars nor more than one hundred do,lars, together with costs, and in default of payment to imprisonment for a period of not less than ten, or more than thirty days.

"I trust that the officers of this Department will have the hearty co-operation of all the potato growers of the Province.

"From information gathered at the hearing recently held in Washington, I am satisfied that this disease can be soon eradicated."

Secretary for Agriculture
J. B. DAGGETT,

Conserving the Moisture by Cultivation on J. Elliott Smith's Fair View Fruit Farm, Wolfville, N. S.

The N. S. Farmers Association.

The annual meeting of the Nova Scotia Farmers' Association will be held this year in the town of Bridgewater, County of Lunenburg, on January 27th, 28th and 29th.

We have not yet received a copy of the programme but we are creditably informed that Geo. H. Barr, Chief Dairy Division, Ottawa and W. A. McKay, Supt. of Dairying for Nova Scoria, Miss Jennie A. Fraser, Supt. of Women's Institute for N. S., J. M. Trueman, Prof. of Agriculture and Farm Supt., Truro and Prof. Straw, Horticulturist at the N. S. A. C. will be there and give addresses on subjects of interest to farmers, their wives and families.

Prof. M. Cumming and F. L. Fuller will also be there and none will be listened to with a keener interest by the farmers of Nova Scotia than they.

W. W. Baird Supt. of the Experimental Farm, Nappan, has also been invited to take part in the proceedings and if he sees his way clear to accept the invitation, something good may be expected from him.

It will do you good to go to Bridge water and associate with the other progressive farmer that will be there.

The citizens of Bridgewater and the farmers of Lunenburg county will deliver the goods in making your stay both pleasant and profitable.

Warbles in Cattle.

Sunscriber writes: "I am told that there is a cure for warbles that grow in the backs of cattle during the winter. If this true?"

A recent publication from the Health of Animals Branch, Ottawa, deals with this subject at some length. This department can give no cure for this trouble, further than to suggest that any application which will prevent the warble fly from attacking the cattle and laying its eggs during the summer will prevent the development of the grub in winter. The eggs are laid on cattle that run out of doors during June and July. As to where and how the insect passes the different stages of life from the time the egg is laid until the grub appears in the animal's back is not perfectly understood as yet by the veterinary profession.

The most common and most feasible method ol ridding cattle of these pests is to squeeze them from the skin in the late winter. Any form of injection that kills the grub while in the flesh is injurious, as the grub must then be absorbed by the animal body. In districts where cattle are dipped for mange and ticks, there is scarcely any trouble from grubby hides, the dip evidently destroying the eggs or the newly hatched larvae. A fairly strong solution of sheep or cattle dip applied during June and July might be tried.

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

JANUARY 13, 1914.

DATES OF ISSUE.

January 13-27
February 10-24

A Happy, Prosperous 1914 to all.

* * * *

If you have made some errors in past years that were not conducive to the best returns for your labors try and not repeat them in 1914.

GOOD MACHINERY.

Every farm should be equipped with first-class machinery but it is not necessary to spend so much money annually as is done in order to do this. More is lost yearly to the average farmer through lack of care than is necessary. When an implement has served its purpose it should be cleaned of oil, repainted if needed, and put under cover. There is not another industry in the world perhaps that takes as little care of its machinery as the farmer. The accomplishment of destruction by rust and rain is always more than by use.

THE N. S. FRUIT GROWERS MEET.

The annual meeting of the Nova Scotia Fruit Growers' Association will be held in the town of Kentville on January 20th, 21st and 22nd. A good programme is assured. The various topics for discussion will be of such vital importance to each and every fruit grower that they cannot afford to miss the meetings. The practical and theoretical phases of questions confronting the best interests of fruit culture and marketing will be compared by men who knaw, men who are doing things, and after whom the world at large is beginning to pattern.—Hear them, it will do you good.

SKILL COUNTS IN FARMING.

There are not a few who still believe that skill counts only in business, in manufacturing or in the professions, and that the farmer has not any great need for this quality in pursuing his calling. There is no greater fallacy than this. Of the different callings we have named, we would place farming at the top of the list of those requiring the highest skill and intelligence in its successful operation. To practice soi, cultivation so as to obtain a maximum return, to breed and raise stock in a way to reap the greatest reward, and to carry on the business of farming in the most profitable manner, requires no mean skill and intelligence. For this reason the cleverest boy should be kept on the farm. Educate and train him for his work, and other things being equal, he will have a greater chance than his competitor who has not been so trained and educated.

NEEDS TO BE AN OBSERVER.

There is no occupation that demands wider observation and good judgment than that of agriculture. Especially is this seen in spring time. Plans for the utilization of the ground have been resolved in the farmer's cranium during the winter months. He had to take into account the past crops on that field, the probable, and, if possible, the exact nature of the soil, the question of fall prices, the suitability of the weather, and the cost of help and harvest. Anyone will get a return of some kind on any land with any management, so that the wayfarer, though a blockhead, need not starve, yet to become affluent, and the most serviceable to society and industry, he must produce the maximum. That getting of the maximum makes of the farmer a man of rare executive ability. One common mistake that tillers of the soil fall into, is not being quick enough to adapt themselves to the changed circumstances. The man who can see ahead as to what the demand will be, and the one who will quit raising what his farm was never intended to produce, is the one to prosper.

WHERE THE FARM SHINES.

In writing for the May Century, Luther Burbank says some things in his article, "The Training of the Human Plant," that will bear repeating. Mr. Burbank says: "I should not only have the child reared for the first ten years of its lile in the open, in close touch with nature, a barefoot boy with all that implies the physical stamina, but should have him reared in love. Love must be at the basis of all our work for the race; not gush, not mere sentimentality, but abiding love, that which outlasts death. A man who hates plants, or is neglectful of them, or who has other interests beyond them, could no more be a successful plant cultivator than he could turn back the tides of the ocean with his finger tips. The thing is utterly impossible. You can never bring up a child to its best estate without love. God made religion, and man made theology, just as God made the country, and man made the town. I have the largest sympathy for religion, and the largest contempt I am capable of for a misleading theology. Give the child nature. Let their souls drink in all that is pure and sweet. Rear them, if possible, amid pleasant surroundings. If they come into the world with souls groping in darkness, let them see and feel the light."

DON'T RELY ON INERTIA.

Merchants and manufacturers in the of the tide of a magnificent business era are liable to rest on their oars and depend on the inertia acquire from the first wave to carry them to fortune. It will be wise to remember that motion continues no longer than the time when fiction and other resistances combined become equal to the force from which the motion is derived. If the efforts of the last few months have brought orders at a rate that equals the capacity of a factory for production or a store for sales, don't imagine that the force can be drawn and the rate still maintained. Motion is not perpetual. A moving body gradually moves more slowly until it stops, after the impulse ceases, and much more exertion is required to set it in motion again than to keep it moving after it is started.

Let us remember how difficult it was to start this new prosperity, and continue to employ the agencies which helped. Too many orders this month end too few next are not first rate business. However busy one may be today, sound business considerations require that he shall keep in operation the influences for bringing business tomorrow. Those who neglect to apply this rule of action to their affairs will in a few months hence have plenty of unwelcome leisure to devote to vain regret.

THE FARM WORK-SHOP.

There are but few farms on which a workshop is not needed, for there are several reasons why they are profitable investments. Some one will say, 'the blacksmith shop is too handy for me to put up one of my own.' But even if the shop is just across the road from your house, the shop bill will be the same. Material costs the blacksmith but little, the shoe and nails to put on cost him but five cents and for his work he gets fifteen to twenty cents for a few moments work. Other work is practically the same. With a farm shop, the hired man can do most of the work, on rainy days, under your supervision. My blacksmith bill, to say nothing of the carpenter work, has been as high as twenty dollars a year and this was only part of what I was out. My time was worth something. I have sent to a shop nearly a mile away and found that others were before me so that my work could not be done that day. Another trip next day and my machines must stand idle. No matter how simple the break or how easy to mend, we must go to the shop, if we are not prepared to do it at home. Then if we have an outfit at home we can fix it or have it fixed to suit ourselves which is not always the case when we are obliged to send to the shop, for the smith does not understand the nature of the trouble, as we do, and so does not know how to fix it. Another point, this is good training for the boys and hired men. They can learn to put up buildings, fences, gates, make and repair harrows, plows, rollers, repair machines, shoe horses and many other things, the "know how" of which will be a great help in after life. Every farm should be equipped with some kind of an outfit if it is only a wood working one costing a couple of dollars. A complete outfit for wood and metal work need not be expensive, say cost from ten to twenty dollars. I have spent that much in a year in direct pay-out besides quite a lot of time consumed. The house in which to house them, should be roomy but not expensive, in most of the cases they are made of second hand lumber and covered with boards, planks or felt.

THE POSSIBILITIES OF A SEED GROWING CENTRE IN ANTIGONISH.

We have frequently referred in the columns of the Maritime Farmer to the important role, in the development of a better agriculture that has been and is being assumed by prominent clergymen of all denominaions.

The far-seeing clergyman takes an active interest in the temporal as well as in the spiritual welfare of his parishioners. Many of them are leaders in the introduction of innovations in certain localities that tend for better business methods in the various transactions connected with agriculture.

We had the pleasure of hearing Rev. Dr. Hugh McPherson, of St. Francis Xavier College, Antigonish, give an address before the meeting of the Maritime Seed Growers' Association at the recent Winter Fair, Amherst, on "The Possibilities of a Seed Growing Centre in Antiganish.

The County of Antigonish is rich in agricultural possibilities. She is also rich in men, many of whom have had the opportunity of attending that splendid educational institution in which Dr. McPherson is one of the instructors.

The graduates of St. Francis Xavier are not, however, confined to the County of Antigonish. You will find them filling prominent positions in church and state all over the world and a great many of the more recent graduates owe their love for the promotion of agriculture to the teachings and example set by Dr. McPherson.

Many of our Nova Scotia readers, who attended the annual meeting of the Nova Scotia Farmers' Association at Antigonish some years ago well remember how kindly they had been used by the Dean of St. Francis Xavier College, whose name, by the way is also Dr. Hugh McPherson but not the Dr. McPherson of our sketch, although he too, takes a deep interest in agricultural subjects.

In agitating for better conditions of growth, selection and sale of seeds in the rich agricu,-tural district of Antigonish, Dr. McPherson is doing a work that is sure to be far reaching in its results.

Dr. McPherson's address will be found on page 221.

Rev. Dr. Hugh McPherson.

The Possibilities of a Seed Growing Centre in Antigonish.

The question I am about briefly to discuss is whether conditions are favorable in the County of Antigonish for the production of high class seed in such quantities as will supply whatever local demand there may be, and also enable farmers to place seed on the market in carload quantities.

Before answering the question in the affirmative as I am going to do, I may be permitted to say that there is noticeable in Antigonish, as indeed in other parts of the Provinces, an awakening in the agricultural life of the country. This is very apparent to any observant man who is in touch with the community. Among our best farmers especially, in fact among all classes, there is increased interest in the work of the farm and an optimism and quiet enthusiasm which give promise of good developments in the near future. The farmers seem to be ready to enter heartily into any advance movement and are desirous and eager to take hold of new and better methods.

With nearly a century gone by since pioneer days, we are yet only young as a community, and as with all beginnings development is at first slow and on general lines; but already differentiation is taking place, tendencies are showing themselves, organization is the order of the day. A sign of this growth is the fact that specialized work is being taken up and it seems to me we struck our specialty, at least a good special line when last summer we organized a local branch of the Canadian Seed Growers' Association. This club was started with a membership of about twenty, with enough more members in sight when we are ready for them. Our work is nearly all ahead of us, but we can see no difficulties big enough to prevent us in a few years from having a smart seed producing community. Our object will be, of course, to produce seed under the rules of the Canadian Seed Growers' Association to help one another in the task by each other's experience, and to co-operate in the disposal of the product. The members are starting with cereals only. When we get well under way it is probable some other seeds will be taken up. Antigonish is a good county for potatoes and other roots. Some fields could have been seen this year from which clover and timothy seeds might have been gathered and the possibility of propagating a native strain of alfalfa has on more than one occasion been demonstrated.

We have this advantage in starting that there are among our numbers some who have been members of the Canadian Seed Growers' Association for a number of years and whose experience will be invaluable to the beginners.

Now, as to the adaptability of Antigonish for this work. On the live stock side of farming there is a strong tendency towards dairy stock, and this would seem to go admirably with seed growing. To keep up the fertility of the soil there is nothing better than the dairy cow, and a good fertile soil is a first essential for seed-growing. On the other hand, good seed for the farm crops is just as necessary to produce plenty of feed for the cow, and seed for the market is an excellent cash crop to supplement the income from the dairy. And let me remark that a suitable money crop has an important place in the evonomy of the farm, and that high-class seed seems to be a most suitable one for our county, especially for such farms as are a considerable distance from the Railway. Nor will the objection against selling crops off the farm hold when there is question of such a valuable article as high grade seed. Its feeding value can be replaced at a much less price.

Looking at the problem in the abstract the elements upon which the formation of a successful seed growing club depend, would seem to be, the land, the climate, and the men. Of suitable land we have plenty beyond question. True some of it has been "run out" by injudicious methods of cropping; but even that will respond generously to proper treatment.

Without going into detail as to soil, I may say that a large percentage of the area of the county is good soil capable of being brought into a high state of cultivation. About one-half of it is underlain by limestone and a considerable area of shale and smaller areas by sandstone and crystalline rock. There are several types of soil in the meadows or intervales there are alluvial soils. The uplands are mostly various grades of clay, which make strong retentive soils. The faces of the hills are often gravelly. The topography or lay of the land is also an important feature. To present the best conditions for cultivation, to get an even stand and even maturity, the land must be level and of the same quality. Not only do our meadow lands possess this important feature but also the same condition can be secured on a large portion of the upland. Beyond the elevations which rise from the valleys are stretches of comparatively level land where excellent cultural conditions can be procured.

In climate there is no essential difference between our country and the rest of these provinces. In the springtime the land is probably a few days later in "warming up" than in the counties west of us on account of the ice which sometimes packs on our North Shore. This drawback may in part at any rate be offset by drainage. In any case the condition could be taken advantage of for the natural selection of hardier strains.

In regard to the third very important element the people, I think I may say that when they take hold of a thing they have the intelligence, determination and energy to carry it through.

Of more practical importance are the steps to be taken to convert our possibilities into actualities. Inducements in the way of a good market are open to us; and the various exhibitions and fairs, provide a stimulus and give zest to the work. It must be recognized that the work of producing high-class seed like that of producing high-class stock calls for the exercise of the highest form of the husbandman's skill. With an army of scientific men both at home and abroad at work on this question the course to be followed has been made clear. There is still however, quite a chasm between the laboratory of the man of science and the ordinary man's farm. We are in hopes that our new club will help to bridge it over. But a great deal of practical work must be done. Good foundation stock must be procured. The beginners have a whole lot to learn about judging, selecting, the preparation of the seed plot and the multiplying field. All this will involve much work and demonstration on the part of the officers of the C. S. G. A., and on the part of all who are interested in the promotion of this good cause.

Nor should the value of meetings and discussions be overlooked. It would be, of much advantage to those who are now engaged or who are about to engage in seed growing to come together as frequently as possible. Scientific men could explain to them the vast importance of improvement in seed, and the laws upon which plant improvement rests. Talks could be given on the advance that has already been made at home and abroad, on the questions that are still awaiting solution, so that all might participate in the wonderful interest that attaches to the whole work. An evening a month of work of this kind would prove interesting and of value in connection with the work on the farm.

Paper read by Rev. Dr. McPherson, St. Francis Xavier College, Antigonish, at the annual meeting of the Maritime Seed Growers' held at Amherst during Winter Fair week.

Importance to the Farmer of Growing His own Seed Grain.

This paper is presented for discussion with the admission that it is not filled with new thoughts on the above subject but is only another repetition of oft repeated truths. My license being the fact that a good thing is none the worse of being twice told.

In the season of 1912 many Maritime Province farmers suffered serious losses through the use of western grain for seed. To these men it is quite unnecessary to say "raise your own seeds." The other side of the argument comes from the men themselves in the statement that partial failure of their crop in 1911 resulted in a scarcity of seed grain so suplies must be bought. The situation resolved itself down to this, not every man need, should or can raise all his seed grain every year but when he cannot, the supply should come from his neighbor's farm where conditions are similiar to his own and where he has watched the growing and the handling of the crop. If he has to go farther afield still, it is obvious that the more closely he has been following the care, handling and selecting of that seed, the climate, the type and cultivation of the soil on which it was produced, the more surely can he judge whether it will be likely to produce the crop which he desires. This association finds a great deal of unfullness here not only in the improvement of the seed of the farm on which the selections are made but in its control of the conditions of seed production.

The lesson taught by the experience of 1912 has been of inestimable value but there is still room for improvement. Some samples of Western grain were sent me in 1913, which were lacking in vitality, one sample having only about 30 per cent. germinable seeds. Discussing this question with a farmer in the vicinity of Truro last Spring, I was surprised to hear him say, "There was no frosted grain in the West last fall." I am not sure whether I undeceived him or merely confirmed his belief that my knowledge of such matters was of little value.

Why raise your own seed grain? It is a fact well recognized among live stock breeders that selection and breeding must go hand in hand with feeding and care if good results are to be obtained. No one expects to produce and maintain a large draft type of horse under the conditions which have produced the Shetland pony or the Bronco of our Western plains. On the other hand forced feeding and hot house conditions in general do not give us the most valuable animal. In short, to produce a breed, strain or family of most value it is essential that the conditions under which the work of improvement is done shall at least approximate those in which that particular animal is expected to do its work. Does the same apply to plants? It most assuredly does. In the final analysis the work of the animal breeder and that of the plant breeder are identical. The laws of heredity are exactly the same. The inheritance of acquired characters has equal importance.

Most of our cultivated plants have been known in the wild state within the written history of men. Selection and cultivation have made them different and more valuable today. If this selection and cultivation has been and is being done with the purpose of improving the value of these crops, is it not obvious that the conditions should be as nearly as possible those under which the crop is expected to yield returns?

No seed grower likes to procure his seed from a country where the growwarmer since that seed tends to be ing season is perceptibly longer and less hardy and to require a longer season for growth and maturity. Proof of this lies in the fact that Siberia and other parts of Russia have given to Canada some of the best varieties of oats that we have. Sweden stands next in line. In fact for the Maritime Provinces the Swedish varieties may even beat the Russian. On the other hand, more unfavorable conditions than ours do not aid in making any variety or strain better suited to our own. It is true that the more rigorous the conditions the easier it is to select from the plants produced those which have the ability to thrive despite these conditions. Even where man does not interfere there is a process of natural selection resulting in the survival of the fittest. Fittest for what? Certainly the fittest to endure hardship and to make growth under adverse conditions, but not necessarily, in fact not usually, the fittest to make use of those more favorable. The American Banner, an oat produced under conditions similar to our own, is perhaps the most popular variety in the Maritime Provinces while Daubeney improved in part of Canada where the season is drier than ours, is only a light cropper here. No certain family or breed of animals after having been stunted in size and made more hardy by being forced to endure exposure and to

HORTICULTURE.

Important Booklet on Brown Tail and Gypsy Moth.

The department of Agriculture of Nova Scotia has just given to the public one of their most important publications for the past year.

It is Bulletin No. 5 entitled "The Brown Tail and Gypsy Moths" by Robert Matheson, Ph. D., the Provincial Entomologist, but now in research work at Cornell University Utica., N. Y.

Dr. Matheson has done his work exceedingly well, and has not only given us a most readible bit of interesting literature, but has put in condensed form the history, distribution, and areas infested by these destructive moths, and in detail tells of our control—work against these pests, cost of such a necessary campaign and the necessary precautions must be taken, if we will eradicate these most injurious and obnoxious insects from orchard, field and garden.

This booklet is artistically illustrated with colored plates, so at a glance one can tell the "Brown-Tail" or "Gypsy Moth" if discovered, by comparing it with the colored cuts of these moths.

This is a most useful report and all interested should have a copy, and you can get one free, as long as the supply lasts, by applying to the Agricultural College, Truro.

The Farmers Worst Enemy—From an Article by Forrest Crissy in the Saturday Evening Post.

What is the grower's worst enemy? The whole round of the farmer's life is a running fight against enemies—seen and unseen. Every sowing, every planting, is an enlistment for sharp, active service against a horde of hostile forces, every profitable harvest is a victor's portion of the fruits of conquest.

Science has trained the microscope on some of the enemies and forced

Water Lilies in the Ezperimental Farm Gardens, Charlottetown, P. E. I.

them into the open, and chemistry has followed up this coup, by finding an effective firing range on these hostiles once ambushed in their own invisibility. After all, though the microscope of the scientist and the retort of the chemist seem to have left this vital problem still unsolved. The big question—What is the farmer's wornst enemy?— yet remains without a conclusive answer.

Recently I put the question to one of the shrewdest and most successful fruit growers in America—and to draw him out I added:

"Is it frost, flood or drought? Is it weeds? Is it animal disease, plant disease or insect pests? Or, as some say, is it the oppressive middleman?",

"No," he answered, after a reflective pause; "it isn't the codling moth or the chinchbug, the smut or the cut worm, the cattle tick or hog cholera, the untimely frost or the withering drought, or even the middleman, that costs the farmer—at least my kind of farmer—the heaviest toils of unrealized rewards. It isn't any kind of a bug that can be spotted with a microscope or banished with a sprayer. The worst enemy of the farmers of America is the crooked farmer who puts his product under false pretenses and thinks that his short-sighted tricks are putting him ahead in the game. He fouls the whole nest for himself and every man in his particular line of production."

"Next in rank to this man as an enemy to his kind is the farmer who is too ignorant of markets, of standard and of up-to-date business practice to put up a really honest pack of anything. Take apple growing, for example. There are states in which this industry ought to be at its best because of superior natural advantages, but where it has been given a black eye, a knockout blow, by the crooked and the ignorant practices of growers who have been numerous and persistent enough to befoul that state's reputation in the big general market. Maybe this sounds sensational. but keep your eyes open, dig down into the situation and see what you find. I know it's much more popular—especially at grower's conventions and farmers' institutes—to pound the commission merchants and the middleman and call them robbers. A good many of them are, and a great many more of them are the victims of a malformed and unstandarized selling system that makes exact honesty a mighty difficult practice. But dishonesty outside the ranks can never do quite the harm that crookedness right in one's own camp does. I offer this as a plain business observation, not as a moral text. The grower who puts up a crooked pack or the one who, from ignorance or shiftlessness, puts up a shoddy pack, is a more effectual enemy to the whole body of growers than the dishonest and greedy middleman. Personally, I regard these men as really the worst enemies of the whole farming fraternity."

Steady Demand for Apples.

There is a steady demand for apples at the present time accompanied by and appreciable enchancement of prices. In Scotians the leading lines are Fallawaters, Ribstons and Blenheims, at prices ranging from 18s. to 24s. per barrel for No. 1 grade, 16s. to 20s. for No. 2, and 13s. to 16s for No. 3. Canadian Golden Russets, usually a popular line for the holiday trade, are dearer, the best marks fetching 32s. per barrel. Baldwins worth worth 24s. to 28s., Spies 22s. to 26s. and Fallawaters 21s. to 24s., 32s. to 36s. and York Imperials 30s. to 33s. per barrel.

These prices are likely to be maintained for some weeks.

Your Commissioner visited Smithfield market during this week where he found a first rate, large consignment of Golden Russets readily saleable at 33s. per barrel.—Birmingham Trade Commissioner, Dec. 17, 1913.

The Fall Web Worm.

Those unsightly webs, which in the fall of the year are to be seen in the orchard, make known the presence of the fall web worm. This insect should not be confused with the tent caterpillar which appears earlier in the season.

In habits and life history these two insects are quite dissimiliar in many respects. The tent caterpillars, which caused so much damage in some districts this season, are now in the egg stage of the life circle. In the character of the web there is a marked difference. The web worm builds a large web, generally near the ends of the branches, and always remains in the web. As new feeding grounds are required, the web is enlarged. For this reason the web becomes most unsightly because of the cast of skins and excrements of the inmates.

On the other hand, the web of the tent caterpillar is more compact and found usually in the crotch of two or more limbs. The caterpillars remain in it only between feeding periods. When feeding they consume the entire leaf while the web worm feeds only on the upper surface, giving the leaves a characteristic brown appearance.

The parent moth of the web worm is white in appearance with black markings on the wings. In early summer it emerges from the cocoon in which it has passed the winter. The females lay their eggs in patches on the under side of the leaves. During the latter part of July and the month of August the caterpillars begin to make their appearance. They then proceed to form the web. When full grown—about one inch in length —they spin their cocoons in preparation for the winter.

Because of the season at which this pest makes its appearance, spraying as a means of eradication is hardly practical as few orchardists care to spray so late in the season. Occasionally the last spray far codling worm remains on the leaves long enough to be of assistance in combating the web worm.

Usually the only remedial measure necessary is to keep a sharp lookout for the webs and destroy them as soon as noticed. As the webs are nearly always found at the tips of the branches, little damage is done to the tree by removing them.

Cold Storage of Apples.

A large proportion of the difficulties in cold storage of apples is the result of delaying the storage of the fruit after it is picked. The apple ripens more quickly when picked than it does when hanging on the tree and maturing in the same temperature. The diseases with which the fruit is effected appear to develop more rapidly when storage is delayed. If the weather at the harvest time is warm —that is, if the temperature avecages above 60 degrees Fahr.—the fruit matures and the diseases grow with unusual rapidity. On the other hand, if the weather at this time is cool, the ripening process is slower and the diseases may not increase in severity. The ripening that occurs during the period of delay between picking and storing shortens to that extent the life of the fruit in the storage house. Keeping (oe apples in piles or packages in the orchard before storing, or delays in transit, or at the warehouse before they are placed in storage, therefore, cause the fruit to ripen and diseases to spread, and the ap ples may already have commenced deteriorating when they enter the warehouse.

The importance of storing fruit immediately after picking is greatest in the warmer apple belts of the country, though it is equally important in the northern apple-growing sec tions when the fall months are unusually warm.

In handling the apple for cold storage the ideal is reached when the fruit can be taken directly from the tree to the warehouse. So far as the fruit is concerned, a similiar condition is approached when it is shipped to a distant warehouse in refrigerator cars, or the ideal is attained in those sections or seasons in which the picking and handling of the crop occur in cool weather. It may not be parcticable for the apple dealer who is located in a distant city to store his fruit in warehouses situated near the orchards, nor is the local warehouse advisable in sections where there are inadequate facilities for transporting the fruit to distant mar kets during the winter. As a general rule, it is to the mutual interest of the owner and the warehouseman that the fruit be stored where it can be watched carefully throughout the season by the owner, as the warehouseman is responsible only for the proper management of the building and its contents, and not for the ultimate condition of the fruit.

A system of warehouses located in orchards and managed by growers, or operated by companies in near-by towns, would reduce some of the difficulties with which the growers in the warmer apple belts have to contend, and would thereby give greater stability to the industry in those sections. There can be no question, from the standpoint of the keeping of the fruit, of the advantage of a ware house located near the orchard, but its usefulness to the business as a whole depends not on the keeping quality of the fruit alone, but on the larger question of adaptability to the present requirements of the apple trade.

The same variety of apple may vary widely in keeping quality when grown under different conditions. The apple is affected by its geographical environment, by the type of soil, by the condition of the trees, and by other factors connected with its production. It is probably safe to say that an environment which causes the fruit to grow with unusual rapidity causes it also to mature correspondingly fast after the fruit is picked.

BANK OF NOVA SCOTIA
ESTABLISHED 1832

Safeguard Your Savings

Many a man has lost the hard-earned savings of a life-time through bad investments. You should safeguard yours. Since 1832 we have been serving the public as a depositary for their savings. Capital and Surplus $17,000,000. Total resources over $78,000,000. Our Annual Statements have been independently audited since 1906. 13

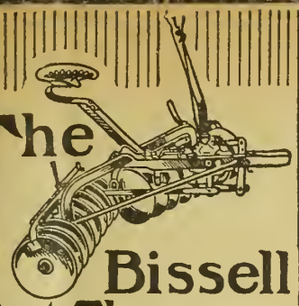
BRANCHES OF THIS BANK in every Canadian Province, and in Newfoundland, West Indies, Boston, Chicago and New York



The Bissell Out-Throw Disk Harrow

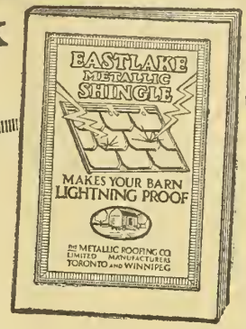
To settle all doubt about which is the BEST OUT-THROW DISK HARROW, we ask you to test the "Bissell" Out-Throw in a field competition with other Out-Throw Harrows.

The "Bissell" Out-Throw has many features that have made the name "Bissell' famous in connection with Disk Harrows. It has plates of the correct shape. One gang is set slightly ahead of the other. The gangs cannot crowd or bump together and cause the Harrow to rock when you come to hard soil—a new feature in Out-Throw Harrows. The hitch is well back, the draught is light and there is no neck weight.

The machine in actual use is our best advertisement. No need to send special travellers to sell the "Bissell." We put our name on every Harrow. If you would like to learn more about Disk Harrows, send to Dept. M. for free booklet of both out-throw and in-throw styles. 72

T. E. BISSELL CO. LTD., ELORA, ONT.

If You're Going to Build Get this Book —Sent You FREE



Just send us your name and address—say what you're going to build—and we will put in your hands at once information that will be worth money to you if you are going to build any new buildings or repair any old ones. You can't afford to put up the same kind of building that was good enough in former years when wood and labor were cheap. Why do you suppose all modern buildings are "Metallic" made? Simply because, "Metallic" building materials make better buildings, cost less in the first place and are cheapest in the long run.

You should know more about the "Metallic" way of building—you'll find that at no greater cost you can build better buildings with "Metallic" materials than in any other way.

The information is sent you entirely free—though it is worth a great deal of money to you to know the facts in this book. Ask for Eastlake Book 00.

SEND YOUR NAME NOW!

Shows You How to Build Better and Save Money

Perhaps you didn't know that well-built wood barns cost as much today as "Metallic" built buildings. Yet it's a fact. We'll prove it to you. Think how much more a "Metallic" built barn is worth to you. Get the facts. They will interest you—if you want the best buildings your money can build.

The METALLIC ROOFING CO. LIMITED
TORONTO King & Dufferin Sts. Manufacturers Established 1884 WINNIPEG 797 Notre Dame Ave.

Apples grown on low, rich land or on young trees are abnormally large and are likely to deteriorate sooner than fruit of the same variety from older trees on a more congenial soil. Fruit stimulated by nitrogenous fertilizers in orchards in which the water-holding power of the soil has been largely increased by the incorporation of vegetable matter is often inferior in keeping quality. Similiarly, apples produced on quick-acting sandy soils and on the strong new lands in some of the newer apple-growing regions are apt to reach the end of their life early in the season. The grower should recognize the fact that the apple is greatly modified by its environment, and that the inherent differences in each lot are not eliminated by storage treatment.—T. A. Tefft, New York, in Pennsylvania Farmer.

The Importance of Ventilation for Stored Fruit.

As fruit-raising is limited to a few regions enjoying favorable climatic conditions, the widespread consumption of its perishable product is regulated by the efficiency of transportation and storage facilities. If fruit can be put on a distant market in first-class condition, its excellence creates an enlarged demand. If it can be stored for any length of time without deterioration, the season is lengthened to just that extent. While recent progress in the art of cold storage has been the biggest factor in the unbuilding of large centralized fruit industries, the frequency of carloads spoiled in transportation, indicates that there is still room for improvement in our present methods of packing, loading and car refrigeration.

Recent scientific investigations on the subject emphasize more than ever the necessity of ventilation at all times for mature fruit in transportation or in storage. Carloads of peaches leaving the point of shipment in first-class condition, well packed, with individual wrappers and loaded on board with air space around each box, have been known to suffer seriously in comparatively few hours in an iced car at 45 degrees. When fruit deteriorates rapidly in refrigerator cars the damage is usually most marked in the top tiers, especially in the center of the car.

A study of the physiological chnages that occur in ripe fruit will aid in realizing the importance of ventilation. All plant and animal life breathes, taking in air or oxygen and giving off carbon dioxide, an inert gas. This process of respiration is carried on by ripe and ripening fruits as well as by the leaves, with this difference, matured fruit will continue to give off carbon dioxide long after it has ceased to absorb oxygen. The practical application of this scientific truth is that in a sealed refrigerator car the fruit soon uses up the pure air and fills the enclosed space up with the excreted gas. In afew hours when all the oxygen in the car is used up, an unnatural physiological action called anaerobic respiration (breathing without air) begins. This results in several important tissue changes.

DESTRUCTION OF TEXTURE.

In any kind of breathing oxygen is required. If this is not supplied by the outside air, the fruit takes it up from its own body cells; feeding on itself, as it were. This brings about changes that result in a general breaking down in texture so that when the fruit reaches the grocery store and becomes warmed to the street temperature, a rapid softening occurs. In the case of peaches the fruit may appear first-class, but it is brown in flesh underneath the normal skin, tasteless and mushy. Among dealers fruit of this kind is said to be affected with ice-scald. Cherries and bananas are also species that suffer considerably from anaerobic respiration. Some fruits like apples lose their beautiful red color and become bleached by the inertert gases.

Besides the destruction of texture, anaerobic respiration frequently produces alcoholic fermentation within the fruit. Of all the fruit experimented with, this is most noticeable in the case of cherries. When fruit is allowed to ripen in pure air, any alcohol that may be formed is converted into volatile oils. These oils are the source of the distinctive flavor and the aroma associated with fruits, and are not produced when the ripening is checked by the accumulation of carbon dioxide. Hence poorly ventilated fruit may have the snappy, sharp taste of alcohol or be bitter and repugnant because of other chemical changes set up.

PRESERVATION OF GREEN FRUIT.

The scientific researches which pointed out the loss in texture, flavor and aroma of ripe fruit from anaerobic respiration, also reveals the fact that green peaches under the same conditions may be kept considerably longer than in air. In all green fruit there is a stiff gummy constituent called pectose, which makes the cells turgid and the fruit hard. In the sunlight and air, this is changed into a thin jelly soluble in the cell sap. Green fruit does not respire readily without oxygen and hence anaerobic respiration checks al, the processes of life including the transformation of pectose. When put in fresh air again respiration slowly comes back to normal and ripening takes place. If some gas may be found which will retard these life processes and still not destroy the flavor, the fruit may picked greener, transported and then ripened.

The practical upshot of this scientific investigation is that all refrigerator cars should contain provision for allowing carbon dioxide to escape and for the admission of fresh air. Certain companies, appreciating this need of plant tissue for air, have conducted experiments with car ventilators. The results have been so satisfactory that one large company is putting on a special ventilator, which can be opened or closed as the shipper prefers, over the doors of its refrigerator cars.

The question of wrappers for fruit is worthy of an extended investigation from the standpoint of ventilation. The good points in favor of separate wrappers for peaches, apples and pears are numerous, but such wrappers only allow a very small air space around each fruit. This limited supply of oxygen is used up in a few hours and air circulation is practically impossible. Some type of perforated or porous wrappers has been suggested as a possible means of combining the desirable features of wrappers with the better ventilation of fruit.

Apple Day.

The International Apple Shipper's Association, of which U. Grant Borden as Chairman, with headquarters at Baltimore, Md., are busily engaged telling the people of the country what the apple really is—what it means to the producer as an income-yielder when properly handled, graded and packed, and at the same time enlightening the housewives as to its merits for culinary uses. The Association has recently published a booklet entitled "Housekeeper's Apple Book," in which is contained among other things, 197 receipts for preparing the apple, each one tested and approved by one of the leading experts in domestic economy. This booklet is mailed free upon application to the Chairman.

October 21st of each year has been set apart to celebrate feast-day of the apple, when this national fruit is to be talked about, devoured, bought, donated or what not just so the apple figures in the transaction. Thus will our great American fruit boom itself.

How Potatoes Can Multiply.

A lady in Oakville has been conducting some interesting experiments with potatoes. The year before last she discovered a large potato weighing a pound, which boasted 13 good eyes. The next winter she cut the eyes out and planted them in strawberry quart baskets, keeping watch over them. In the spring time these were planted, being enough to make five hills, which when cultivated, brought forth enough seed to plant 26 hills this spring. The 26 hills finally produced 208 potatoes, weighing 56 pounds.

Farmer Ads. Bring Results.

Gentlemen:—

The ad. running in your paper for the past few issues, has fulfilled its mission so please cut it out and send account to date,

Sincerely yours,
ANDREW McPHERSON.

DAIRYING.

The Guernsey.

Editor Maritime Farmer:

During the last winter, while in the employ of the United Fruit Companies Ltd., of Nova Scotia, having a few days of spare time at my disposal during the Easter Holidays, I decided to spend them on the Island of Guernsey.

The Island had particular interest to me from a dairyman's standpoint. Some twenty years ago I purchased my first purebred Guernsey, and from that time to the present I have been endeavouring to build up a purebred herd of the best milking qualities.

During this time I have purchased cows from different places, and have selected, and discarded until at the present time it is my policy not to keep any but those which will qualify for registration in the "Record of Performance."

Guernsey is quite a popular pleasure resort; and it is no wonder, for a more beautiful spot would certainly be hard to find. In England, while they do not have the severe cold which we have in this country, yet there is prevailing damp cold weather, so that vegetation is kept dormant. Not so in the Island of Guernsey. Here on the 23rd. of March we are greeted with the songs of summer birds and beautiful blooming flowers, while the Palm and other southern trees, which are abundant on the Island, all went to give us the impression that we had been landed in the warm and Sunny South.

The Guernsey Cow Fleur De Jardin.

I was under the impression that dairying was the principal industry of the Island, but I soon found that this was only one of the ways it manifested itself. It is from this country that England receives large supplies of early flowers and vegetables. It is estimated that Guernsey has fully fifty acres under glass. In these hot-houses they produce early tomatoes, cucumbers and other vegetables. We saw acres of cultivated flowers which were being cut for the English markets. But of course it was the Guernsey stock that interested me most.

We put ourselves under the care and guidance of Mr. Lapatrol who is Secretary of the Agricultural Association, and under his direction were driven around the Island and saw the best herds. All the stock on the Island are purebred, as nothing has been imported except for butchering for over seventy years. And yet, here as well as other countries, some have had the intelligence to select and build up excellent dairy herds, while others have pursued the slipshod methods, and consequently have not made any advancement.

How have Guernseys become the famous dairy breed which we now find them? Why is it that these people have an active demand for their stock at prices ranging from $100.00 to $1000.00 per head? One does not need to be an experienced dairyman to perceive that the Guernsey herds are of exceptional quality. In the early times previous to fifty years ago, the early settlers laid great stress on selecting and patronizing bulls from the best producing cows. This was done in these early times regardless of any particular type. There is no doubt but that this idea did much towards making the Guernsey the famous dairy cow which we now find her.

Some fifty years ago, the stock shows came into prominence, which without doubt, while encouraging better stock, yet in a way tended to give prominence to looks rather than performance. There is no doubt that the prevalence of a beefy type of Guernseys on the Island is due in a great measure to the fact that the shows demanded animals in good condition and sleek appearance. Within the last ten years, type and performance have each been given their proper place, with the result that no time in the history of the breed has there been such advancement.

At their annual exhibition the most coveted prizes are the silver cups offered by the King. Two cups are offered for the two best bulls. In winning these prizes it is imperative that the dam been shown with the bull, also as many of his progeny as is possible. It can readily been seen that under this system of awarding prizes, it is not the exceptional individual that wins, but the nearest perfect individual surrounded by the best family.

It is quite customary in Nova Scotia to keep a bull until he is three or four years old, then dispose of him but on the Island I find that the bull that is valued is the one that has offsprings that have proved themselves large milk and butter producers. One of these bulls, Masher Sequal has forty-two decendants in the Advanced Registery.

The Champion cow of the Island, Fleur Di Jardin had dropped a calf a few days before my visit. Her record for the previous year was 11845 lbs. milk. In addition to hay and pasture, this cow was being fed four quarts of bran and two quarts oat meal. In my examination of the different herds, I was rather inclined to

The most reliable, best quality and value.

Starts instantly — every time, with Bosch Magneto ignition—no batteries to run down and give trouble.

Self-oiling, no oil cups to fill—no oil to waste.

Self-regulating at all loads. No attention needed when at work.

Fitted with phosphor-bronze bearings throughout, the best money can buy.

No babbit metal to wear and run out.

In a word, the best quality engine ever seen in Canada

We have sold over 50,000 Melotte Cream Separators in Canada during 15 years. Ask any Canadian user how he likes the Melotte.

Well—**we guarantee** the Lister as good an engine as the Melotte is a cream separator. We can't say more.

Why Our Students Succeed
From the day a student enters our College to the day of graduating every hour of time is put to the best possible use. Teachers and students work together with a definite purpose. Courses of study full and thorough but no aimless work, no useless repititions, no nonsense. Every step a preparation for practical business life.
Personal interest taken in the progress and welfare of every student.
Students can enter at any time.
Catalogue free to any address.
THE ST. JOHN Business COLLEGE
S. KERR
Principal

criticise, in my own mind what I considered their weak points, but for "Fleur De Jardin" I had nothing but the highest admiration. She showed dairy quality of the highest order.

From the cut herewith given you can easily see the clean cut head, without any surplus meat, slim horns and neck, open build, large lood capacity, good sized udder with prominent milk veins. "Fleur Di Jardin" is built for business, and with the heavy feeding which is given for large test in America would make a large record.

The Guernsey people have lately adopted an advanced registry, under Government Inspection. Some cows have already qualified and a large number are now under test. These people have never adopted the excessive feeding for the large tests which is common among the dairymen on this side. We can learn much from them in the matter of making the most out of what we have. With 16,000 acres of arable land they support not less than 5,000 head of cattle. The season is warm so that they pasture most of the year. The cows are tethered out and in the flush of milk are milked three times a day.

These dairymen give the business their very best attention, and I believe get the best results.—John N. Caute, Berwick, N. S.

Summer Months Yield.

The average yield of 9,349 cows tested in dairy record centres maintained by the Dairy Division, Ottawa, in Ontario, Quebec, and the Maritime Provinces in August was 622 pounds of milk, 3.6 test, 22.6 pounds of fat, almost identical with the average yields in August of 1912 and 1911.

Concealed beneath the comforting blanket of such a general average are widely different yields in various provinces, counties and herds. For instance at St. Joseph N. B. the average yield was 458 pounds of milk, at St. Prosper, Que., 611 pounds, at Woodstock Ont., 809 pounds. Similarly the yield of fat varied from 17 to 27 pounds per cow.

But comparing districts not so wide ly apart; the total yield of 446 cows at Farmers Union, Ont., was 10.472 pounds of fat, but with 19 fewer cows at Frankford, Ont., the yield of fat was 889 pounds more. In the St. Hyacinthe, Que., district, a more startling comparison than this is the fact that one herd of 14 cows produced actually 4,940 pounds of milk more than another herd of 14.

Similiar comparisons might be made for herds at the several centres: but what is of infinitely more concern to the average patron is the comparative yield of each individual cow composing this herd. The wise, the far-seeing dairyman, knows from his records, so easily kept, just what each cow gives, not only for an odd month, but for the whole year. Then he strides towards intelligent improvement, not wanting the 458 pounds-per-month kind, but the type that yields six or seven or more thousand pounds per year.

Some Cows from Glengarry.

Among the records collected by the dairy division, Ottawa, this season are some from Glengarry that show the average yield of 155 cows to be 4,450 pounds of milk, 3.5 teast, 159 pounds of fat. Included in that is the yield of one herd of nine cows including one three-year-old that averaged 6,209 pounds of milk, 3.3 test, 205 pounds of fat.

It will be noticed that this herd produced 1,669 pounds of milk and 46 pounds of fat above the average of the 155 cows. Another herd averaged 220 pounds of fat, or 61 pounds per cow above the average; with fat reckoned at thirty cents per pound, this is equivalent to over eighteen dollars per cow, indicative of the thousands of dollars extra that might be coming into a district if the cows were keyed up to a higher producing level.

One noticeable feature of this section is the large number of poor yields from two and three year olds. But it is not only the heifers that are responsible for lowering the average yield. There are cows from six to ten years old that gave only 2,800 pounds of milk and 159 pounds of fat.

So that instead of a contrast of only eighteen dollars, it is found that there is an actual difference of over forty-one dollars in the cash received from mature cows in the same period. This is surely a statement strong enough to cause every dairyman to examine closely into the performance of each cow he keeps. Milk records are easily kept and a composite sample from each tenth day's milk can be tested once a month. Is this not worth doing?

130-Egg Incubator and Brooder Both For $13.90
If ordered together we send both machines for only $13.90 and we pay all freight and duty charges to any R. R. station in Canada. We have branch warehouses in Winnipeg, Man. and Toronto, Ont. Orders shipped from nearest warehouse to your R. R. station. Hot water, double walls, dead-air space between, double glass doors, copper tanks and boilers, self-regulating. Nursery under egg tray. Especially adapted to Canadian climate. Incobator and Brooder shipped complete with thermometers, lamps, egg testers—ready to use when you get them. Five year guarantee—30 days trial. Incubators finished in natural colors showing the high grade California Redwood lumber used—not painted to cover inferior material. If you will compare our machines with others, we feel sure of your order. Don't buy until you do this—you'll save money—it pays to investigate before you buy. Remember our price of $13.90 is for both Incubator and Brooder and covers freight and duty charges. Send for FREE catalog today, or send in your order and save time.

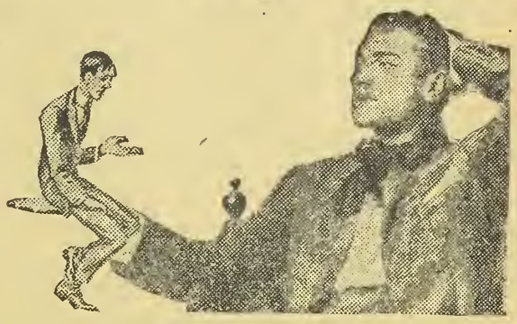
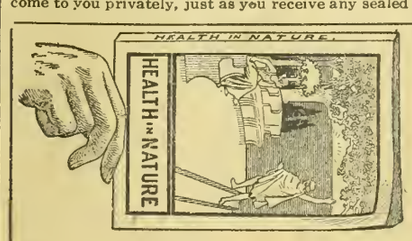
86 Pages of Personal Advice
Free To Any Man
MY DEAR READER:
In the handsomely printed little book or private pocket compendium for men (containing 8,000 words and 40 half-tone photo reproductions), which I publish and gladly forward by mail, free, sealed to any man anywhere in the world who sends me the free coupon below. I have included certain parts that contain some very important advice or suggestions of a strictly personal nature which, I believe, cannot be found in any of the Private Hygiene books for men that are now sold at high prices all over the country. It will thus be seen I have endeavored, through the medium of my free book, to give my readers absolutely free of cost really MORE, in some respects, than others offer and make a large charge for. All you have to do to get this free book of mine is to use the coupon below, or if in my neighborhood, I extend an invitation to you to call at my office. Please remember that this free offer involves absolutely no obligation on your part, and there is nothing whatsoever for you to pay and nothing whatsoever for you to buy in any way, unless you should decide at some time in the future that youwould like try one of my mechanical VITALIZERS (described below). but that rests entirely with yourself. Over a million of these little free books have now been sent to men who wrote for them as I want you to do, and who live in all parts of the globe. I publish this free book in English, Swedish, Danish, Finnish, German, French and Polish, bnt I always send the English edition of course, unless otherwise instructed. Kindly use the little coupon.
SANDEN, AUTHOR.


MANLY, VIGOROUS MEN RULE THE WORLD
In reference to manly strength, I believe it is now more generally acknowledged than ever before that the manly man stands back of all that makes for progress, development and achievement in the world, a truth which any of us can easily verify if we but look about us with impartial eyes.
As a matter of fact, the man who is debilitated, unstrung and enervated cannot, for perfectly obvious reasons, expect to approach those real and masterful attainments which seem but a natural and easy accomplishment for him whose nerve force, brain power and manly strength are perfectly normal. Hence, we acknowledge the debilitated, weakened man to be handicapped in every walk of life where real manhood counts, yet it would indeed be cruel of me to here so state the fact in public print were I not of the honest opinion that there is every hope for the unmanly man to restore himself to a state of health and vigor, if he but clear his mind of abnormal fear, and then make a fair, square effort to redeem himself.
There are two specimens of humanity for which I have no earthly use. One is the man who, though now strong and vital, yet plunges into dissipation and excess with the certain knowledge of his unmanly fate. The other is the man who, though knowingly debilitated and enervated, makes no effort to get away from his life of dissipation and wrong practices. As a matter of fact, there is no hope for either of these unfortunates But for him who acknowledges his errors, who may come to me and say, "I have paid the penalty of my past follies, but I am THROUGH with my life of dissipation, and I am going to make a manly effort to restore myself," to such a man, I carea not what his physical condition may be, I can say in all truthfulness, "You, my friend, are on the right road to new strength and new manhood", for he really is, and there is no doubt about it.
I make a little appliance that I call a VITALIZER, which I designed to aid just such men who seek manly strength. I am not offering this VITALIZER here for sale, but merely suggest that you, reader take this opportunity to learnall about what this little appliance is doing today everywhere throughout the world; then, if in the future you want to use one yourself and will so write me, I will gladly make some liberal proposition whereby you may have one to try. The VITALIZER is fully described in one section of the free book which the coupon below entitles you to,
The VITALIZER is made up in a very light form weighing only several ounces, and you wear it on your body all night. It generates a great, soft, pleasant FORCE which I call VIGOR, and which flows in a continuous stream into your nerves, organs, blood and muscles while you sleep. I am satisfied in my own mind that I have access to a great POWER in this little VITALIZER which in the future will be more and more relied upon all over the world in the treatment of debilities and nerve weaknesses.
With special attachments which carry the FORCE of the VITALIZER to any part of the body, it may be used by women as well as men for he treatment of rheumatism, kidney, liver, stomach, bladder, disorders, nervousness, lack of energy, etc. Therefore, please send for the book today, or if you happen to live in or near this city, I should be very glad to see you in person. Office hours, 9 to 6.
WHAT THE FREE BOOK TEACHES YOU
The little free illustrated book of special private information, referred to above, is meant really to be a self guide for all men through the years before and after marriage and onward to a ripe old age. It is written in perfectly plain language, entirely free from technical terms, so that any one may easily grasp the full power of its good advice from two or three careful readings. It attempts to point out a safe road to new manhood or new manly strength, and as such is dedicated to mankind generally. One part of this book fully describes my little VITALIZER referred to above.
Remember, as soon as the coupon below is received I agree to forward to you one copy of this illustrated booklet, absolutely free of charge and in a plain, sealed envelope, so that it wil come to you privately, just as you receive any sealed mail.



DR. M. F. SANDEN CO.,
140 Yonge St., Toronto. Ont.
Dear Sirs—Please forward me your book, as advertised, free, sealed.

Profitable Traction Power in Lunenburg County, N. S.

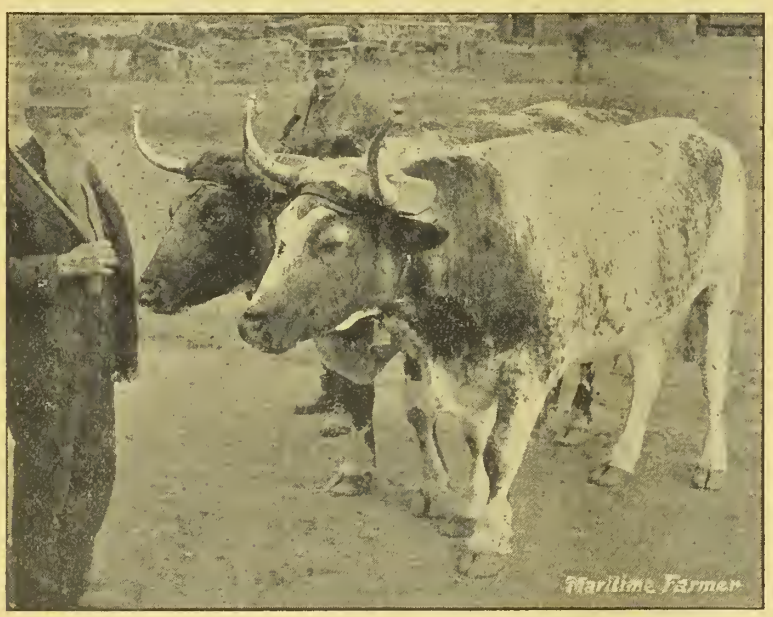
Editor Maritime Farmer:

I am sending you a picture of my oxen. These oxen won first prize at the Lunenburg Co. exhibition in the five year old class. They also won third prize in the pulling match. They gird seven feet, one inch. Their dams were grade short-horns; their sire a grade Ayrshire. Fine oxen hring a fancy price here from $200.00 to $275.00. Most of our agricultural society members are breeding Short-horns as it is the general opfnion of the members that beef pays better than dairying.

Following are the prices that the consumer had to pay for his Christmas dinner at Bridgewater.

Turkey, 35 cents per pound; geese, 30 cents per pound; ducks, 25 cents per pound; best roast of beef, 18 cents per pound; rib roast of pork, 16 cents per pound; butter 28 cents per pound; eggs, 35 cents per dozen; potatoes 70 cents per bushel.

One of our dealers sold half a ton of geese bought in Shelburn Co. The Christmas trade was better than was anticipated.—Wallace Rodenizer.



A Prize Winning Pair of Oxen Owned by Wallace Rhodenizer, Lunenburg, N. S.

Harry Always Raises a Good Pig.

Editor Maritime Farmer:

Last year I sent in a report to the Maritime Farmer on the weight of my two pigs, seven months and 12 days old. The two just weighed 600 pounds. This year I killed one just seven months old that weighed 315 pounds. Last year my pigs were grade Yorkshires. The pig I had this year was just pig. I bought it at three weeks old from Mr. Harry Payne, of Spring Hill. I would like to hear through the Maritime Farmer if this record is beaten. Remember this is no fish story. It is all truth. I did kot keep the pig for my own use as it was too fat for my taste. If we can make pigs weigh as much as this one at seven months we are doing all right. Some of the pigs from the samc litter as mine weighed 200 pounds and under. I hope to hear about some of the heavy oncs in Nova Scotia as their were good ones there last year.—Harry Alliston, Spring Hill, York Co.

Age of Cattle.

For the purpose of settling any disputes at any time that may arise out of protests made against exhibitors who show animals out of their class, from the standpoint of ages, the International Live Stock Exposition management has adopted the following specifications as a basis for determining the ages of cattle:

Twelve months—Any animal of this age shall have all of its milk (calf) incisor teeth in place.

Fifteen months—At this age, center pair of incisor teeth may be replaced by center pair of permanent incisors (pinchers), the latter teeth being through the gums not yet in wear.

Eighteen months—The middle pair of permanent incisors at this age should be fully up in wear, but next pair (first intermediate) not yet cut through gums.

Twenty-four months—At this age the mouth will show two middle permanent (broad) incisors fully up and in wear, and next pair (first intermediate) well up, but not in wear.

Thirty months—The mouth at this age may show six permanent incisors, the middle and front intermediate pairs fully up and in wear and the next pair (second intermediate) well up, but not in wear.

Thirty-six months—Three pairs of broad teeth should be fully up and in wear, and the corner milk teeth may be shed or shedding, with the corner permanent teeth just appearing through gums.

Thirty-nine months—Three pairs of broad teeth will be fully up and in wear, and corner teeth (incisors) through gums, but not in wear.

These specifications are based upon a large number of observations made upon animals of various ages, and may be used by those who purchase young animals to use permenently in their herds as a means of determining their ages should they be in doubt as to their being such as they are representated to be by the sellers. Of course, animals that are well fed and forced to early maturity from forced feeding frequently have their teeth appear considerably before the usual time that they make their appearance, but the above specification may be relied upon as a good guide, as they reasonably allow for such cases. A matter of a few months does not make much difference, except in the very young animals.—Colman's Rural World.

NEW COAL OIL LIGHT BEATS ELECTRIC OR GASOLINE

10 Days FREE—Send No Money

We don't ask you to pay us a cent until you have used this wonderful modern light in your own home for ten days, then you may return it at our expense if not perfectly satisfied. We want you to prove for yourself that it gives five to fifteen times as much light as the ordinary oil lamp; beats electric, gasoline or acetylene. Lights and is put out just like the old oil lamp;

BURNS 70 HOURS ON 1 GALLON OIL

Gives a powerful white light, burns common coal oil (kerosene), no odor, smoke or noise, simple, clean, won't explode. Guaranteed.

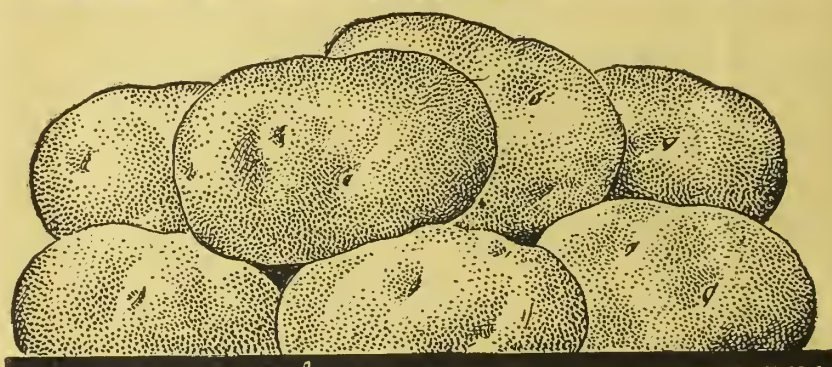
$1000.00 Reward

will be given to the person who shows us an oil lamp equal to this Aladdin in every way (details of offer given in our circular). Would we dare make such a challenge to the world if there was the slightest douht as to the merits of the Aladdin? We want one person in each locality to whom we can refer customers. Write quick for our 10 Day Absolutely Free Trial Proposition, Agents' Wholesale Prices, and learn how to get ONE FREE.

AGENTS WANTED

to demonstrate in territory where oil lamps are in use. Experience nnnecessary. Many agents average five sales a day and make $300.00 per month. One farmer cleared over $800.00 in 6 weeks. You can make money evenings and spare time. Write quick for territory and sample.

MANTLE LAMP CO. 282 Aladdin Bldg., Montreal & Winnepeg



Progressive Jones says:

"Get Bumper Crops from Worn-Out Soil"

Scores, yes hundreds, of my farmer friends have got bumper crops from soils they thought were worn out. They now swear by

Harab FERTILIZERS

One of them, A. Robinson of Rosemount, tells me that he used Harab Fertilizers on potatoes and turnips without any manure on the land which was very old and poor. He got a bumper crop and is more than satisfied. Another man, D. J. Ferguson, got a grand crop from very light land that had been hard run by tenants.

Friend, if you have some poor land, some worn-out soil, don't be discouraged. Harab Fertilizers will make that soil yield bumper crops, and make you happy, or my name isn't Progressive Jones.

Harab Fertilizers are natural Fertilizers, manufactured from blood, bone, trimmings, etc., of animals slaughtered at the immense Harris Abattoirs. To these are added Potash and just enough quick-acting Nitrates and Superphosphates to start the plant off with a vigorous growth.

The cost of using Harab Fertilizers is small. The results are big. Write to The Harris Abattoir Co. for their booklet. It gives the information you want to know.

Yours for bumper crops
Progressive Jones

The Harris Abattoir Co., Limited, Toronto

BENN & TERNEY CO., LIMITED,

General Agents in New Brunswick for Harab Fertilizers.

Eureka Potato Planter

Catalog sent free

No matter whether you grow large or small quantities of potatoes we have a size of planter that is just what you need. The Eureka line of Potato Planters is the largest manufactured. This machine takes only *one* man to operate it. That means less trouble and expense for *you*.

Opens the furrow—drops the seed any distance or depth required—puts on fertilizer (if desired)—covers up—marks for next row.

It's an easy machine to operate. The steel and malleable iron construction mean lightest possible weight and increased life of machine. Your repair bill will be practically nothing. Plants uniform depth at *all* times because plow is directly under the axle. Dropping mechanism in plain view of driver. Does not injure seed.

We supply planters in three sizes, for one or two rows—with or without Fertilizer Attachment.

For 15 years the Eureka Potato Planter has been successfully used throughout the world.

We also make Eureka Potato Cutters and the Eureka Mulcher and Seeder—a mulcher, smoothing harrow, cultivator, weeder, seeder.

POTASH IN CANADIAN AGRICULTURE

Canadian Farmers during the past year used almost 100 p. c. more POTASH than during the preceding twelve months. The total value of the POTASH sold in the Dominion by agriculturists in 1906 was $87,848.00; the POTASH used by farmers during the year ending 31 March, 1913, was valued at $330,399.00. These figures speak for themselves.

POTASH is an **Indispensable Plant Food**. No other ingredient can replace it. Every farmer should realize that to grow a maximum crop his soil should contain an AVAILABLE supply of POTASH, sufficient for the crop's requirements.

In pursuance of our educational policy, we are prepared to send our representatives to address meetings on "THE FERTILIZING OF CROPS" and the "RATIONAL USE OF FERTILIZERS". Secretaries of Farmers' Institutes and Agricultural Societies are invited to communicate with us to arrange suitable dates for such meetings.

Write us for FREE copies of our educational bulletins. These include:

"Artificial Fertiltzers, Their Nature and Use."
"The Potato Crop in Canada."
"Fertilizing Grain and Grasses."
"Fertilizing Hoed Crops."
"Farmer's Companion," etc.

GERMAN POTASH SYNDICATE
1102b Temple Bldg. Toronto, Ont.

It costs only a one cent Postal card to answer any advertisement in Maritime Farmer and you will get many dollars worth of information.

Diseases of the Liver in Cattle.

The commonest disease of the liver is known by the name of jaundice (a modified old English name), characterized by suppression, or alteration of the liver functions. Symptoms: Yellowness of eyes and skin, constipation, dullness, loss of appetite, colouration of milk in milch cowl, also of urine, slight fever, skin harsh and dry and abnormal thirst, which if neglected, or if allowed to go beyond treatment, lead eventually to dropsy or other complications. We are all familiar with the red appearance of the blood; it is due to a coloring matter called Haemoglobin (Greek Haima blood). This is changed into a new chemical product in the liver cell—i. e., a pigment, Bilirubin, which gives the yellow colour to jaundiced subjects. Haemoglobin contains iron, and in a normal way acts as a storer or go between of oxygen and the blood cell, and possibly the morbid condition of the liver cell in changing this constituent of the blood may have a great deal to do with the ill effects of jaundice. The yellowness of the skin is only one symptom; it may occur in health from the nature of the food, and is constantly found in some of the best breeds. The causes of jaundice are too much fatty food, want of daily exercise (the working ox is not very liable to it), exposure to cold and wet, whereby the blood is thrown abundantly inwards from the skin, causing congestion of the abdominal viscera—the liver being the earliest to suffer.

GALL STONES.

Gall stones are biliary calculi, and are generally found in the gall bladder from crystallised cholestrin. During their passage they are a cause af great agony by blocking up the common bile duct; when passed into the first intestine the pain ceases. (There is no means of diagnosing gall stones from a case of ordinary colic). If they are not passed, or are some time in passing, jaundice must ensue.

HEPATITIS.

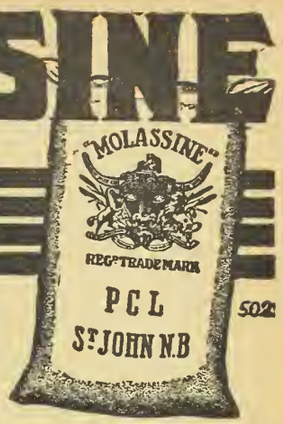
The affix "itis" always means inflammation. Hepatitis, or inflammation of the liver, is most prevalent in hot weather, and may lead to jaundice. In its early stages it is recognized by flatulence, grinding of teeth, flinching if the region of the liver is pressed, high coloured urine, constipation, and clay-coloured dung. Tumors of the liver in many cases produce this disease, so also enlargements of the lymphatics of the capsule, tubercle, cancer, and in so nervous an animal as the ox several cases have occurred which cannot be accouned for except on the supposition of anger or fear causing a spasm of the common duct. An enormous quantity of bile is secreted, and if it cannot be transmitted as fast as it is secreted, the gall bladder gets full and cannot receive the excess, which will be forcibly returned upon the hepatic system. This is not likely to occur in the horse, it having no gall bladder. Abscess of the liver and simple congestion arising from obstruction or disease of the valves of the right side of the heart, malignant growth, fatty degeneratian and many other causes might be mentioned, but these are the principal.

In diagnosing or prognosing this disease and others of the liver one feels the truth of Bacon's remark: "He who taketh in but a few considerations easily decides." It is obvious to those who have taken the trouble to peruse this article that it is not at all an easy matter. One may roughly divide the causes under two heads: Are they functional? Are they organic? In the former, treatment will be successful; in the latter, useless.

TREATMENT.

Now as to treatment. First, house the animal, if in cold weather especially, in a comfortable, airy, warm, box or yard. Gentle voluntary exercise is of the greatest service. Feed sloppy foods, chopped roots of any kind, green stuff, no oats or cake, only a little long hay, no chaff stuff, and give a plentiful supply of pure, fresh water. Isolation from other animals is also indicated, as the animal affected feels irritable and fretful and desires rest and solitude. A change of byre or pasture helps materially. As to medicine, experience has taught us that mercurial preparations and salines combined have occasionally produced most beneficial effects. I prefer at first to try a drench composed as follows:—2 drams of grey powder, 2 drams of powdered cayenne pepper, ¾ lb. of glauber salts. Mixed in sufficient quantity—at least a quart—of thin gruel. Give drench slowly, not putting it down like water into a sewer, as if given hastily it may drop into the rumen and not reach the true stomach, and will only act when rumination starts, which may be in abeyance. A similar drench may be administered for three days in succession. So much, however, depends on the conditions of the case that only the professional can safely advise upon it after careful examination. Speaking generally, the following may be prescribed: Low diet for a time with tonics and salines. I sometimes prescribe a quart of old ale with 1 oz. of bicarbonate of soda dissolved in it twice daily, and it seems to have a very good effect. If the animal is difficult to drench, then try malt extracts mixed with or sprinkled over rations. They apparently supply the blood indirectly with sugar, where the liver is not secreting sufficient glycogen. As there is often some congestion of the lungs a good rubbing of the sides once daily with a stimulating liniment, such as white oils or hartshorn and oil, affords a good deal of relief. During the convalescent stages tonics should be given. A useful tonic is made with 1 oz. of sulphate of quinine, 2 oz. of dilute nitro-muriatic acid, water to one pint. Four tablespoonfuls to be added to half a pint of water, and given twice daily, or ½ oz. of powdered cinchona bark, ½ oz. of powdered chloride of ammonia, and ½ oz. of powdered ginger for each dose. Unfortunately, in all bad attacks of liver complaints there is great emanciation, and it often takes months for the animal to recover its condition.—Southern Vet.

MOLASSINE MEAL



is as good as pasture all the year round. Your horses, milch cows, steers, pigs and sheep will be in the pink of condition in the spring and can be turned on grass without any loss if fed regularly with MOLASSINE MEAL through the winter.

Ask your dealer, or write us direct.

THE MOLASSINE CO. OF CANADA, Limited
St. John, N. B., Montreal and Toronto

Handy Feed Carts.

The dairy or beef feeding farm that does not use one or more handy feeding carts in serving the rations is not up to the minute. With hired labor high in price and limited in quantity, the progressive farmer has to employ every possible labor-saving device on his farm that is not too costly and yet thoroughly efficient. The grain and silage feeding carts satisfy these requirements.

With the aid of those food wagons one man can feed 50 animals in less time than it would take three men to perform the same work by hand. The carts can be made in size to correspond to the herd, so that when both are loaded, they will accomodate about enough grain and roughage for one meal for the animals.

Any farmer handy with tools can easily construct these carts. Use a pair of old buggy or light wagon wheels and their axle for the lower part of grain cart and build the body out of sound lumber. If desired he can equip the grain wagon with an upright on which a pair of scales can be hung, so that the grain ration of each animal may be rapidly weighed out.

The silage cart may well be placed on several pairs of old truck wheels, the wheels being so placed that the cart can be turned around in a relatively small space as compared with its size. In feeding one cart can be placed in front of the other and one man can push both wagons down the feeding alley, distributing the grain and silage as he goes along.

THE HORSE.

Horses Teeth and Their Irregularities.

With the exception of troubles of a quite temporary nature which may be caused during the periods of teeth ing, when they are young, it is ordinarily very rare for horses to suffer from any defects of the teeth. It is only in their old age, as a rule, that the latter are liable to become defective, and this circumstance will then cause the masticating powers to become more or less impaired, although in a large portion of cases the teeth of even very old horses will remain in perfectly good condition to the end, and not give the slightest trouble, the animal continuing to be able to chew its food just as readily and completly as in its younger days. Practically the only operation in connection with the teeth which is of any importance or at all likely to be required consists in filing or rasping down the sharp edges of the molars, or some of these when, owing to some abnormality or other, they hurt the gums and in consequence prevent the horse from using its teeth properly in grinding its food.

There is, however, seldon any real cause for resorting to this operation, and there can be little doubt that in certain instances it is performed quite unnecessarily and had better had been left undone. The edges of a horse's molar teeth normally get worn more or less sharp, as anyone can easily ascertain for himself, or may painfully experience when administering a ball by hand in a clumsy manner, and the fact of their being so in no wise inconveniences the animal. It is quite a mistake to suppose, as some apparently do, that because the teeth are sharp at the edges it would be advantageous to have them rasped down. In itself the rasping may not be a painful operation, but it is most distasteful to a horse to have its mouth forcibly pried open and the teeth operated upon, and consequently the procedure is much resented. The great objection to it—and certainly this is a very grave one—is that after such a disagreeable experience the horse will almost for certain be rendered shy of having its head touched for some long time afterwards, if indeed this does not become established as a permanent habit, and that this involves serious disadvantages every horseman will know, for it gives rise to much trouble in grooming, clipping, and bridling a horse, or on any occasion when it becames necessary to handle the horse about the head. There are exceptional cases recorded of horses suffering from a broken molar tooth, caused by the animal having bitten hard upon a stone or bit of iron accidentally picked up with the food. This, however, need not necessarily entail very serious mischief, though it will cause some of the food to be quidded. In any case, such accidents are so rare that ordinarily horse owners are not likely even to come across a case of this kind.

MALFORMATION OF TEETH.

Sometimes we get in horses a certain malformation or irregularity of the teeth known as parrot mouth which consists in the upuer incisor (front) teeth much overlapping and protruding beyond the lower row. This is found to occur principally in old horses. The tendency to this irregularity is generally already present in the young animal, but it is not at that stage sufficiently developed to be noticeable, developing fully only when the horse has aged. In pronounced cases of parrot mouth it becomes necessary to remedy the abnormality by means of operative measures.

WORN TEETH.

In cases of crib-biting an indication to the fact that the horse is addicted to this pernicious habit is very usually afforded by the condition of its front teeth, which will show signs of being much worn away in consequence of the animal continually biting on the edge of the manger or some other object when practising its trick. But in the allied vice of windsucking no such signs are discernible on the teeth, because in the case of this habit the teeth are not used by the animal in order to catch hold of some support when indulging in it, as is done when cribbiting. The abnormal wearing away of the teeth associated with the habit of cribbing renders it more or less difficult, or even impossible, to determine the horse's age with exactitude in the usual manner by the marks on the teeth, for these will become obliterated before their time.

IMPAIRED MASTICATION.

When a horse is unable to masticate its food properly—either owing to tecth trouble, or to defective teeth consequent upon old age, or to some dental irregularity or injury, or to an inflamed or swollen condition of the palate, a complaint commonly known as lampas—it will very often be found to "quid" its food, as it is termed. Quidding consists in small particles or pellets of partially chewed food being dropped out of the animal's mouth, and which will be seen lying in the manger after the

Horsemen Attention!

Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Thier use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Glanders, Spavins, Pinkeye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Troubl, Fevers, Cuts, Sores and will remove bunches of all kinds

BEFORE USING

Why have a sick or lame horse, when you can get a reliable and warranted remedy? The leading horsemen of the Dominion endorse Dr. J. Woodbury's Horse Liniment.

horse has finished feeding. Whenever a horse is observed thus to quid its food, its mouth should be examined to find out what is wrong. In cases the difficulty will, of course, only be of teething trouble and of lampas, of a temporary nature, the quidding ceasing as soon as the normal condition of things become re-established. When the trouble is due to the masticatory powers having become impaired by old age, the obvious course to adopt is to serve the grain in a crushed state, so that it may be more readily chewed by the horse, while the hay and chaff given should be of as soft and fine a character as possible. Hard hay, with tough stalks, and clover hay should be avoided, as such is more difficult to masticate. A good idea also is to mix bran instead of chaff with the crushed corn, the first not requiring so much chewing. These measures may not—in fact, they probably will not—completely prevent the animal from quidding its food, but they will certainly tend to minimise the trouble as well as prove a considerable boon to the old horse.—Argus.

Horse Pointers.

Don't hold the box stall door open and allow the colt to rush through it into the yard for execise, writes an exchange.

He might not strike his hip or shoulder on the post in his haste, and if he did it might not cripple him for life; but chance is a poor thing to bring a spirited colt up on.

Better lead him quietly through before releasing him. The extra restraint will do him no harm anyway.

The time to teach a colt to back is when he is a colt. A good way to do this is to put halter on him, lead him out of the stall, take hold of the halter close up to the chin, then gently but firmly push back, saying over and over again, "Back! back!" He will soon take the hint, and a little practice will make perfect.

"That horse would go anywhere I told him to, if it was right out of the back door of the barn, ten feet down!" That is what a man once said to me, and I believe it.

But that man never asked his horses to do unreasonable things. This is why they had such perfect confidence in him. A horse is first rate judge of human nature—better than most of us are of horse nature.

No amount of pounding or shaking musty hay will make it fit for horses to eat. The best thing to do when you must feed such hay is to wet it thoroughly before putting it into the manger. But it is bad stuff anyway.

An old file is a good thing with which to clean the currycomb when it gets all gummed up, as it sometimes will. A big nail will do the same work, too.

When the brush gets all stuck up from long usage, throw it away and get a new one. You can't get much good out of it in that condition.

Gait.

An open, smooth, frictionless trotting gait is just as essential as blood inheritance to the success of any stallion as a sire of uniform trotting speed. Some of the best bred trotting stallions have proved disappointments as sires even after having taken records in standard time, because they were rough gaited, ran behind, or labored in their action. Some fifteen years ago an exceedingly well-bred stallion was given a time record at Mystic Park. His gait was so faulty that several horsemen remarked that notwithstanding his choice breeding, they would not accept the gift of his services. This stallion was given exceptionally good opportunities, but though upwards of twenty years old, he is credited with only three that have made standard records.—Horse Breeder.

Working the Breeding Mares.

A large farmer in the Midlands who has recently started breeding Shire horses states that it is his intention to keep in his working teams only pedigree animals. He let it be understood that his working stud was to consist exclusively of mares, and that a certain number of them would be bred from every season. The idea is interesting and the result will be followed closely, since (says the "Times") it puts into practice on a large scale a system that has been adopted with success on many farms of moderate size. There is no reason to anticipate other than a successful issue. It has been proved that work is no hindrance to breeding; indeed, the evidence is to the opposite effect. Mares that do a reasonable amount of suitable collar-work are the most regular breeders, while many of the most noted prize colts and fillies are the offspring of mares employed in the regular teams. There is the additional consideration of economic production. Unfortunately working and showing are incompatible proceedings, but the number prepared for the showyard is but a small proportion of the aggregate used for breeding.

A Horse's Gait.

To tell the seat of lameness is often a task of great difficulty, in which the most experienced are at a loss and where the most skilful differ in opinion. You say "dragging hind feet"—i. e., both feet. I think that dismisees the question of lameness from spavin, or stifle trouble, as one would hardly expect both hocks, or both stifles, to be simultaneously affected. This resolves it to be a question of back trouble, and I am inclined to put it down to some interference with the motor nerves, which is a far more serious matter, and one requiring rest, patience, and prolonged treatment. If it is paraplegia, which may be sympathetic disease, fuctional or otherwise, of the urinary or digestive system, it is usually called reflex paraplegia, and is amenable to treatment. If due to injury, and charges in the nerves themselves, or the vertebrae, or sprain of the psoae muscles—i. e., those lying underneath the spinal column, then in the first three cases the horse will get worse, and complete paralysis will ensue, but if it is a case of sprain, time and rest may restore him. The treatment is rest in a fairly large loose box, half the usual quantity of grain, and hay, bran mashes, crushed carrots, as usual. I doubt very much the value of external applications. Of course, there is no objection to trying frictions with the usual white oils along the back part of spine, but I should prefer rather to try the effect of one drachm of powdered nux vomica and two drachms of nitrate of potash mixed, given once daily in damped feed. Try this for three weeks, and note result.—Vet.

POULTRY.

Chart For Line Breeding.

We reproduce on this page the Felch Line Breeding Chart. The work of following out such a system is too complicated for the majority of our readers. The object of line breeding is to conserve blood, and race char. acter Rithout inbreeding, that is to use the same blood with several generations between. In the chart illustrated each, dotted line represents the group No. 1, and the solid line the males, taken from group No. 2, the clear circles representing their progeny. Thus a female from No. 7, mated with male, No. 2, produced No. 3, which is half the blood of sire and dam. Females from this group, No. 3, mated back to their sire, No. 2, produce group No. 5, which is three quarters No. 2 sire blood, and one quarter the bolld of dam, No. 1. Then a male from group No. 3, mated back to his own dam, No. 1, produced No. 4, which is three quarters the blood of dam, No. 1, and one quarter blood of sire No. 2.

Again, a cockerel from group No. 5 and a pullet from group No. 4, or vice versa, will produce group 7,

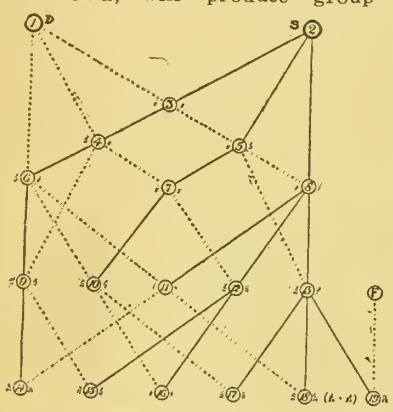

Chart For Line Breeding.

which is mathematically half the blood of each of the original pair, No. 1 and No. 2. This is a second step towards producing a new strain.

Females from No. 5 mated back to the original male, No. 2, produce group 8, that are seven-eights the blood of No. 2, and a cockerel from No .4, mated back to the original dam, No. 1, produces group No. 6, that is seven-eights the blood of the original sire.

A male from No. 8 and a female from No. 6, produce chicks, in group 11, that are half the blood of the original pair. This is the third step, and the ninth mating in securing complete breeding of our new strain. In all this we have not broken the line of sires, for every one has come from a group in which the preponderance of blood was that of the original sires, Nos. 2, 8, 13 and 18, and are virtually the blood of No. 2.

A point has been reached where we would establish a male line whose blood is virtually that of our original dam, and from No. 6 a male is selected and mated with a female from No .4, producing group 9, which is thirteen-sixteenths the original dam, No. 1, and three-sixteenths the blood of the original sire.

Then, a male from No. 9, and a female of the new strain, No. 11, produce group 14, which becomes 21-32 of the blood of the original dam, tnus preserving her strain of blood. A male from No. 13, which is thirteen-sixteenths the blood of the original sire, No. 2, mated to females from No. 10, which are five sixteenths the blood of said sire.

While in number 16 we have the new strain and in No. 18 the strain of our original sire, No. 2, we have three distinct strains, and by and with this systematic use we can go on breeding for all time to come.

Something About Ducks.

1. Don't spend all your money to buy eggs or breeders. Save enough for feed and buildings.
2. Don't buy exhibition birds, but the best utility stock you can afford.
3. Don't get the "blues" if your stock will not respond by an egg yield in two weeks, or four weeks.
4. Don't let your ducks get wet on their backs under four weeks, but give cbem all the water they can drink.
5. Don't overfeed at any time.
6. Don't feed any kind of formula offered and think your ducks should do well.
7. Don't feed whole grain at all times. You can keep your ducks alive, but you get a few eggs only. A little some times as a relish is good for them.
8. Don't leave the dogs or children chase your ducks around their yards.
9. Don't frighten your Runner, as her disposition is wild, but she can be made to be just as tame.
10. Don't set your duck eggs under a lousy hen.
11. Don't fail to give them all the drinking water they need in their pen.
12. Don't change your feed on laying ducks if they lay well a whole season.
13. Don't forget the grit hopper. They need it.
15. Don't mate more than six ducks to one drake.

First Prize Box of Dressed Poultry Packed for Export at the 1912 Maritime Winter Fair, Exhibited by Jack Thompson, Fort Lawrence, N. S.

16. Don't leave your ducks range over your whole farm.
17. Don't forget to handle your ducks by the neck when you are hand ling them.
17. Don't feed your cull ducks over winter. It doesn't pay.
18. Don't leaves your ducks roam all night if you want lots of eggs. Confine your ducks to your laying house until 9 o'clock in the morning.
19. Don't keep your duck eggs four to six weeks and think they will hatch well. Set them fresh for best results.
20. Don't give more than eleven eggs to one setting hen. If you do, it is your loss.
21. Don't think you can't succeed with kucks; you can. Try it and be convinced.
22. Don't forget that eggs kept in a room with temperature from 75 to 85 degrees spoils an egg in three or four days.
23. Don't leave the drakes kill your ducks during the hot July days. When the egg season is past, separate sexes in separate pens.
24. Don't fail to give your ducks a trough of water four or five inches deep when five or six weeks old.
25. Don't forget—25 ducklings in one pen for best results.
26. Don't fail to use a little black pepper for seasoning their mess. Especially if they have diarrhea. Cayenne kepper should be mixed with the black.
27. Don't forget that sprouting oats are the best greens you can give your breeding ducks and young.

TELLING DIFFERENT SEX.

The drakes can be told when seven or eight weeks old by the curl in their tail. Also larger head and has more straight carriage.

The duck as a rule is smaller and by the sound of the noise she makes one can easily discern her sex.

MARKETING.

The ducks for roasting have no equal. They can be made ready for marketing in six or eight weeks, and by hatching your young so that a hatch comes off every week you have eight pens. Every week your ducks are changed from pen No. 1 to pen No. 2, and pen No. 2 to pen No 3, and so on in the regular order, which saves labor and at the same time you have every pen filled. Killing and dressing is much easier with Indian Runner Ducks than with any other strain. They pick almost like a hen. When scalded there is no difference. As a rule they dress very nicely and command good prices. There is always a ready sale for them. Great care should be taken in dressing your broilers and ducks. Have them look nice and clean. You should have a tub of cold water ready to put all ducks into as soon as picked. This will give them a nice color. It all depends on how well your ducks look when dressed to command the highest market price. All feathers should be saved and kept clean, as they will pay for picking and there is always a ready sale for them.

CARE OF DUCKLINGS.

The best care of ducklings should be taken. We told you how to make a brooder. Transfer your ducklings from incubator to your brooder. Leave them in this brooder three weeks and then transfer them to a larger run and colony brooder, made 3 feet wide and 5 feet deep, floor raised from ground 6 inches, front 2½ feet high, back 18 inches high, sides and back boarded solid, front open 2 feet, with mice netting over to pen ducklings up during night, to keep out dogs, skunks, etc.

Have your ducklings clean. Give them straw on floor. From five to eight weeks your ducklings will be a lively set and should have a grass run. The ground aroknd your feeding troughs will soon get muddy. Change places as your ducklings will soon get crusty, which will stop them from growing. Ducklings six to eight weeks old should have a good bath after their meal. They should have a trough of wat?r four or five inches deep to take their bath after meal. Have a regular time for meals, three times daily, and have each to contain about twenty-five to thirty duck lings for best results. However, you can have fifty or sixty to a pen. But you will find that the smaller ones will soon be trampled over and die. You will always find different sizes in a pen of fifty. You had better cull out the smaller ones to save the death rate, At the age of six and seven weeks there is a mighty scramble by making your pens smaller in number.

PEERLESS-PERFECTION
The Fence That's Locked Together
The attacks and onslaughts of animals can't faze it. It's strong, yet springy. Manufactured from Open Hearth steel galvanized wire. When made by this process, impurities are burned out of the metal, removing one of the chief causes of rapid corrosion or rusting.
Read What Others Say
Gentlemen:—There is no fault to find with your fence. The fencing I put up 4 years ago is just as good as the day I put it up, showing no sign of rust, and giving good satisfaction. The Peerless stands the test better than any other make that I have seen. Yours truly, JOHN MASON. Spring Brook.
Gentlemen:—I have been in the fence business for ten years, and I find no fence like the Peerless, both for galvanizing and workmanship. I consider it equal, if not superior to any other make of fence on the market today. I have always found the Banwell-Hoxie Fence Co. people of their word. Yours respectfully, MACK. LILLIS. Glenburnie, Ont.

Egerton Poultry Show.

The fifth annual exhibition of the Egerton Poultry Show and Pet Stock Association was held recently in the New Glascow Curlers' Rink. The occasion was made more attractive by speech-making, which fell to Principal Cummings, of the Agricultural College,, Truro; C. E. Tanner, M. P. P., Pictou; Mayor Rogers of Stellarton, and S. G. Robertson, Esq., Pictou. Principal Cumming, who has a strong, clear voice, was about the only one of the orators who successfully combated the opposition of the crowing roosters, yelping dogs and the barkers of fakirs' row. He complimented the Association on the success of the show and the quality of the exhibits. The Egerton had been the first poultry association in the Province to organize and hold a show, five years ago. Their example was a good one and since then similiar organizations have been established all over Nova Scotia. This year, said the Principal, similiar poultry shows were being held in six provincial towns. He detailed the good work done by such an annual feature, and urged the Association to persevere, and the Department of Agriculture would aid them in every way they could. It gave him great pleasure to declare the show open and he trusted he might be permitted to visit many more such exhibitions.

The other gentlemen, as they were introduced by Master of Ceremonies Eastwood, made pleasing addresses eulogistic of the good work done by the Association.

When you simmer it down it is quite an undertaking for the Directors of this organization to stage this interesting feature each year. There is nothing in it for them but lots of hard work, yet they willingly undertake the task and are not dismayed when they run coknter to bad weather and make monetary loss. Up to this year they did not receive any grant of moneys to lend them a little leeway, and the speech-makers were not unduly given praise when they applauded this work. In Secretary Frehill thay have a capable manager to whom the work from practice, now comes easy. S. Eastwood, as Treasurer, has been almost the back-bone of the institution, with his undaunted energy. In addition to these officials are Mr. Osborne, who has served as President; Mr. Higson, and several others who have been energetic from the start and bore the burden and heat. They are deserving of every credit, and success should attend their efforts.

But to the show proper. Nothing was more noticeable than the improved quality of the stock shown in the poultry classes. The entries were as numerous as last year, and the different varieties were fully ?overed. Mr. Landry, who placed the birds and has watched the progress of the show since its inception, was delighted with this year's classes, and declared that the show is getting rapidly into the premier class. Add to this the fact that there were fewer imported birds, but that the show has attained the desired results and placed Pictou County in the foremost rank as a breeding ground of high class poultry. Four long double rows of coops were required to house the exhibits, and really many splendid birds were shown.

The dogs naturally come in for a large share of admiration, and with the cannies the show has had its effect also. When the show originated, every moon-bayer and cat-chaser in the community was rooted from under the kitchen stove, scrubbed, dragged thither and paraded in the anticipation of a ribbon; we were guilty ourselves. It was then a simon-pure dog show, with the emphasis on dog. After learning a few things it is now a Bench Show, with only the dogs and puppies representative of the different breeds on exhibition. The improvement is marked and the effect much to be appreciated. Mr. Milligan judged, and there is no doubt as to his ability to properly place the entries.

New features have been added this year which greatly enchanced the show. A special department of ladies' fancy work was added, and was well patronized by ladies proficient in fine needle work and fancy art. This is a department that could be greatly added to judging by the success of this year's venture.

Another interesting feature was an exhibit from the Agriculture College at Truro, showing a model poultry house, sample of grains and roots, and a display of insects and pests which are injurious to fruits and farm crops. This was an educational exhibit in charge of Mr. Cunningham, a college student, who was most willing to answer any enquiry respecting the exhibit.

In all, the 1913 show was a marked improvement on all the previous attempts and indicates that this organization has taken the most advanced step in its history. The attendance was most satisfactory, and this also augurs well for future success.—Eastern Chronicle.

Wild Turkey Passes.

Sixty or seventy years ago, in the Niagara Peninsula and all up along Lake Erie's shore, wild turkeys were very plentiful, says C. M. C. in Toronto Star Weekly. What happened to them? Shot out—trapped out— decimated; taking his size and rare flavor into consideration—once the King of Canadian game birds! A Government report of 1892 remarks: "It is now becoming very rare, and is found probably in the counties of Essex and Kent, and even there it is only a matter of a short time when it must become extinct." From all we ever hear of it this is precisely what has happened. As far as this province is concerned the wild turkey has apparently flown to join the Great Auk and our storied Passenger Pigeon "sun-screens."

I remember meeting several people who had been familiar with the wild turkey around St. Catharines—those magnificent creatures of three and a half feet long and five feet in wing spread, often weighing over 20 pounds —and almost the exact counter-part in appearance of our highest valued barnyard fowls.

Whenthe young wild turkeys were hatched, beside some close-hidden log or in the seclusion of the deepest thickets, ten—sometimes fifteen—went to the brood. The mother bird made them the objects of her most constant solicitude and care, the little ones following close as she crept stealthy about among the densest available growth, where the grasses, plants, and fruits that they fed on most abounded. Seeds and buds, too, they loved, and could never resist such delicacies as beetles, tadpoles, and small lizards. The only audible sign of the advance would be the mother's low, tender piping. Any danger ahead, and—at her instant change of tone—every toddler of them disappeared, only to emerge at the cautious parent's soft cluck.

They were very rarely caught sight of on the ground but a dog could always flush them into the lower branches of the nearest trees, which was where the guns could flame their deadly work. Oftener, nowever, "trapping" was resorted to, for the wild turkey was swift in addition to its wariness, and like as not ended its flight in the tallest tree instead.

The ways and means of trapping wild turkeys were as varied as the strategy of the farmer's boy was superficial or profound. Generally a measure of corn, bagged from dad's crib, and a hatchet were the only accessories asked for—or purloined without the asking. An hour or two in the bush was sufficient for the gathering together of enough poles and brush to erect a small "stockade fort," built square, and contracting towards the top, where a rough thatching completed the death chamber. Again the hand axe was called into requisition; this time to facilitate the construction of a "sally port" or ditch-like entrance, of size ample to admit of the entrance of a single turkey. The trap was complete. To bait it was simplicity itself, for the turkey-trapper only laid a few tempting trains from his corn bag, starting at some distance away, and leading through the bush from opposite directions to the entrance of the pen, which also was strewn with the yellow grains that were so litterally "a delusion and a snare." Once in the dark interior whither his love for maize had led him, all reason seemed to leave the big, wary bird at once, and he flew round like one possessed, wounding himself against the sides and narrowed top till incapable of remembering, or finding, the shadowed aperture through which he had entered. In such manner often an entire flock of turkeys used frequently to be deluded and captured.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. adies, this department is yours. Use it to the best advantage.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

He writhed himself quite off his stool in the excitement of his feelings, and, being off, began to make arrangements for going home.

"Mother will be expecting me," he said, referring to a pale, expressive-faced watch in his pocket, "and getting uneasy; for though we are very umble, Master Copperfield, we are much attached to one another. If you will come and see us, any afternoon, and take a cup of tea at our lowly dwelling, mother would be as proud of your company as I should be."

I said I should be glad to come.

"Thank you, Master Copperfield," returned Uriah, putting his book away upon the shelf.—"I suppose you stop here, some time, Master Copperfield?"

I said I was going to be brought up there, I believed, as long as I remained at school.

"Oh,indeed!" exclaimed Uriah. "I should think you would come into the business at last, Master Copperfield!"

I protested that I had no views of that sort, and that no such scheme was entertained in my behalf by anybody; but Uriah insisted on blandly replying to all my assurances, "Oh, yes, Master Copperfield, I should think you would, certainly!" over and over again. Being, at last, ready to leave the office for the night, he asked me if it would suit my convenience to have the light put out! and on my answering "Yes," instantly extinguished it. After shaking hands with me—his hand felt like a fish, in the dark—he opened the door into the street a very little, and crept out, and shut it, leaving me to grope my way back into the house: which cost me some trouble and a fall over his stool. This was the proximate cause, I suppose, of my dreaming about him, for what appeared to me to be half the night; and dreaming, among other things, that he had launched Mr. Pegotty's house on a piratical expedition, with a black flag at the mast-head, bearing the inscription "Tidd's Practice," under which diabolical ensign he was carrying me and little Em'ly to the Spanish Main, to be drowned.

I got a little the better of my uneasiness when I went to school next day, and a good deal the better next day, and so shook it off by degrees, that in less than a fortnight I was quite at home, and happy, among my new companions. I was awkward enough in my games, and backward enough in their studies; but custom would improve me in the first respect, I hoped, and hard work in the second. Accordingly, I went to work very hard, both in play and in earnest, and gained great commendation. And, in a very little while, the Murdstone and Grimby life became so strange to me that I hardly believed in it, while my present life grew so familiar, that I seemed to have been leading it a long time.

Doctor Strong's was an excellent school; as different from Mr. Creakle's as good is from evil. It was very gravely and decorously ordered, and on a sound system; with an appeal, in everything, to the honour and good faith of the boys, and an avowed intention to rely on their possession of those qualities unless they proved themselves unworthy of it, which worked wonders. We all felt that we had a part in the management of the place, and in sustaining its character and dignity. Hence, we soon became warmly attached to it—I am sure I did for one, and I never knew, in all my time, of any other boy being otherwise—and learnt with a good will, desiring to do it credit. We had noble games out of hours, and plenty of liberty; but even then, as I remember, we were well spoken of in the town, and rarely did any disgrace, by our appearance or manner, to the reputation of Doctor Strong and Doctor Strong's boys.

Some of the higher scholars boarded in the Doctor's house, and through them I learned, at second hand, some particulars of the Doctor's history. As, how he had not yet been married twelve months to the beautiful young lady I had seen in the study, whom he had married for love; for she had not a sixpence, and had a world of poor relations (so our fellows said) ready to swarm the Doctor out of house and home. Also, how the Doctor's cogitating manner aws attributable to his being always in looking out for Greek roots; which, in my innocence and ignorance, I supposed to be botanical furor on the Doctor's part, especially as he always looked at the ground as he walked about, until I understood that they were roots of words, with a view to a new Dictionary which he had in contemplation. Adams our head-boy, who had a turn for mathematics, had made a calculation, I was informed, of the time this Dictionary would take in completing, on the Doctor's plan, and at the Doctor's rate of going. He considered that it might be done in one thousand six hundred and forty-nine years, counting from the Doctor's last or sixty-second, birthday.

But the Doctor himself was the ideal of the whole school and it must have been a badly-composed school if he had been anything else, for he was the kindest of men; with a simple faith in him that might have touched the stone hearts of the very urns upon the wall. As he walked up and down that part of the court-yard which was at the side of the house, with the stray rooks and jackdaws looking after him with their heads cocked slyly, as if they knew how much more knowing thay were in worldly affairs than he, if any sort of vagabond could only get near enough to his creakfng shoes to attract his notice, and tell a tale of distress, that vagabond was made for the next two days. It was so notorious in the house, that the masters and head-boys took pains to cut these marauders off at angles, and to get out of windows, and turn them out of the court-yard, before they could make the Doctor aware of their presence; which was sometimes happily effected within a few yards of him, without his knowing anything of the matter, as he jogged to and fro. Outside his own domain, unprotected, he was a very sheep for the shearers. He would have taken his gaiters of his legs, to give away. In fact, there was a certain current among us (I have no idea, and never had, on what authority, but I have believed it for so may years that I feel quite certain it is true), that on a frosty day one winter-time, he actually did bestow his gaiters on a beggar woman, who occasioned some scandal in the neighborhood by exhibiting a fine infant from door to door, wrapped in those garments, which were universally recognised, being as well known in the vicinity as the Cathedral. The legend added that the only person who did not identify them was the Doctor himself, who, when they were shortly afterwards displayed at the door of a little secand-hand shop of no very good repute, where such things were taken in exchange for gin, was more than once observed to handle them approvingly, as if admiring some curious novelty in the pattern, and considering them an improvement on his own.

It was very pleasant to see the Doctor with his pretty young wife. He had a fatherly, benignant way of showing his fondness for her, which seemed in its self to express a good man. I often saw them walking in the garden where the peaches were, and I sometimes had a nearer observation of them in the study or the parlor. She appeared to me to take great care of the Doctor, and so like him very much, though I never thought her vitally interested in the Dictionary; some cumbrous fragments of which work the Doctor always carried in his pockets, and in the lining of his hat, and generally seemed to be expounding to her as they walked about.

I saw a good deal of Mrs. Strong, both because she had taken a liking for me on the morning of my introduction to the Doctor, and was always afterwards kind to me, and interested in me; and because she was very fond of Agnes, and was often backwards and forwards at her house. There was a curious constraint between her and Mr. Wickfield, I thought (of whom she seemed to be afraid), that never wore off. When she came there of an evening, she always shrunk from accepting his escort home, and ran away with me instead. And sometimes, as we were running gaily across the Cathedral yard together, expecting to meet nobody, we would meet Mr. Jack Malden, who was always surprised to see us.

Mrs. Strong's mamma was a lady I took great delight in. Her name was Mrs. Markleham; but our boys used to call her the Old Soldier, on account of her generalship, and the skill with which she marshalled great forces of relations against the Doctor. She was a little, sharp-eyed woman, who used to wear, when she was dressed, one unchangeable cap, ornamented with some artificial flowers, and two artificial butterflies, supposed to be hovering above the flowers. There was a superstition among us that this cap had come from France, and could only originate in the workmanship of that ingenious nation: but all I certainly its appearance of an evening, wheresoever Mrs. Markleham made her appearance; that it was carried about to friendly meetings in a Hindoo basket; that the butterflies had the gift of trembling constantly; and that they improved the shining hours at Doctor Strong's expense, like busy bees.

I observed the Old Soldier—not to adopt the name disrespectively—to pretty good advantage, on a night which is made memorable to me by something else I shall relate. It was the night of a little party at the Doctor's, which was given on the occasion of Mr. Jack Maldon's departure for India, whither he was going as a cadet, or something of that kind Mr. Wickfield at length having arranged the business. It happened to be the Doctor's birthday, too. We had had a holiday, and made presents to him in the morning, had made a speech to him through ,the head-boy, and had cheered him until we were hoarse, and until he had shed tears. And now, in the evening, Mr. Wickfield, Agnes, and I, went to have tea with him in his private capacity.

Mr. Jack Maldon was there, before us. Mrs. Strong, dressed in white, with cheery-colored ribbons, was playing the piano, when we went in; and he was leaning over her to turn the leaves. The clear red and white of her complexion was not so blooming and flowery-like as usual, I thought, when she turned round; but she look-

Better Than Spanking.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 909, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her today if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

TWO WOMEN SAVED FROM OPERATIONS

By Lydia E. Pinkham's Vegetable Compound—Their Own Stories Here Told.

Edmonton, Alberta, Can. — "I think it is no more than right for me to thank you for what your kind advice and Lydia E. Pinkham's Vegetable Compound have done for me.

"When I wrote to you some time ago I was a very sick woman suffering from female troubles. I had organic inflammation and could not stand or walk any distance. At last I was confined to my bed, and the doctor said I would have to go through an operation, but this I refused to do. A friend advised Lydia E. Pinkham's Vegetable Compound, and now, after using three bottles of it, I feel like a new woman. I most heartily recommend your medicine to all women who suffer with female troubles. I have also taken Lydia E. Pinkham's Liver Pills, and think they are fine. I will never be without the medicine in the house."—Mrs. Frank Emsley, 903 Columbia Avenue, Edmonton, Alberta.

The Other Case.

Beatrice, Neb.—"Just after my marriage my left side began to pain me and the pain got so severe at times that I suffered terribly with it. I visited three doctors and each one wanted to operate on me but I would not consent to an operation. I heard of the good Lydia E. Pinkham's Vegetable Compound was doing for others and I used several bottles of it with the result that I haven't been bothered with my side since then. I am in good health and I have two little girls."—Mrs. R. B. Child, Beatrice, Neb.

Just A Little Soap And Water And—

Presto! A Clean Collar

CHALLENGE BRAND WATERPROOF COLLARS

—can be cleaned as easily as washing your hands.

Always neat and tidy—with none of that celluloid or rubber shininess about them.

They look and feel like linen — but outwear a dozen linen collars.

All of linen's whiteness and comfort—without linen's expense.

Sold at all Men's Furnishing and Dry Goods Stores—or send 25c. for sample collar. 6

Absolutely the best Waterproof Collar Made.

ed very pretty, wonderfully pretty.

"I have forgotten, Doctor," said Mrs. Strong's mamma, when we were seated, "to pay you the compliments of the day: though they are, as you may suppose, very far from being mere compliments in my case. Allow me to wish you many happy returns."

"I thank you, ma'am," replied the Doctor.

"Many, many, many, happy returns," said the Old Soldier. "Not only for your own sake, but for Annie's and John Maldon's, and many other people's. It seems but yesterday to me, John, when you were a little creature, a head shorter then Master Copperfield, making baby love to Annie behind the gooseberry bushes in the back-garden."

"My dear mamma," said Mrs. Strong, "never mind that now."

"Annie, don't be absurd," returned her mother. "If you are to blush to hear of such things, now you are an old married woman, when are you not to blush to hear of them?"

"Old?" exclaimed Mr. Jack Maldon. "Annie? Come?"

"Yes, John," returned the Soldier. "Virtually, an old married woman. Although not old by years—for when did you ever hear me say, or who has ever heard me say, that a girl of twenty was old by years!—your cousin is the wife of the Doctor, and, as such, what I have described her. It is well for you, John, that your cousin is the wife of the Doctor. You have found in him an influential and kind friend, who will be kinder yet, I venture to predict, if you deserve it. I have no false pride. I never hesitate to admit, frankly, that there are some members of our family who want a friend. You were one yourself, before your cousin's influence raised up one for you."

The Doctor, in the goodness of his heart, waved his hand as if to make light of it, and saved Jack Maldon ftom any further reminder. But Mrs. Markleham changed her chair for one next the Doctor's, and putting her fan on his coat sleve, said:

"No, really, my dear Doctor, you must excuse me if I appear to dwell on this rather, because I feel so very strongly. I call it quite my monommania, it is such a subject of mine. You are a blessing to us. You really are a Boon, you know."

"Nonsense, nonsense," said the Doctor.

"No, no, I beg your pardon," retorted the Old Soldier. "With nobody present, but our dear and confidential friend, Mr. Wickfield, I can not consent to be put down. I shall beg to assert the privileges of a mother-in-law, if you go on like that, and scold you. I am perfectly honest and outspoken. What I am saying is, what I said when you first overpowered me with surprise—you remember saying how surprised I was?—by proposing for Annie. Not that there was anything so very much out of the way, in the mere fact of the proposal—it would be ridiculous to say that!—but because, you having known her poor father and having known her from a baby six months old, I hadn't thought of you in such a light at all, or indeed as a marrying man in any way,—simply that, you know."

"Aye, aye," said the Doctor, good humoredly. "Never mind."

"But I do mind," said the Old Soldier, laying her fan upon his lip. "I mind very much. I recall these things that I may be contradicted if I am wrong. Well! Then I spoke to Annie, and I told her what had happened. I said, 'My dear, here's Doctor Strong has positively been and made you the subject of a handsome declaration and an offer.' Did I press it in the least? No. I said, 'Now,

Sussex, - - N. B.

Annie, tell me the truth this moment; is your heart free?' 'Mamma,' she said crying, 'I am extremely young'—which was perfectly true—'and I hardly know if I have a heart at all.' 'Then, my dear,' I said, 'you may rely upon it, it's free. At all events, my love,' said I, 'Doctor Strong is in an agitated state of mind, and I must be answered. He cannot be kept in his present state of suspense.' 'Mamma,' said Annie, still crying, 'would he be happy without me? If he would, I honor and respect him so much, that I think I will have him.' So it was settled. And then, and not till then, I said to Annie, 'Annie, Doctor Strong will not only be your husband, but he will represent your late father: he will represent the head of our family, he will represent the wisdom and station, and I may say the means, of our family, and will be, in short, a Boon to it.' I used the word at the time, and I have used it again, to-day. If I have any merit in its consistency."

The daughter had sat quite silent and still during this speech, with her eyes fixed on the ground; her cousin standing near her, and looking on the ground too. She now said very softly, in a trembling voice:

"Mamma, I hope you have finished?"

"No, my dear Annie," returned the Soldier, "I have not quite finished. Since you ask me, my love, I reply that I have not. I complain that you really are a little unnatural to wards your own family; and, as it is of no use complaining to you, I mean to complain to your husband. Now, my dear Doctor, do look at that silly wife of yours."

DAVID MAXWELL & SONS - St. Mary's, Ont. 4

Labor Saving Devices at Ten Cents Apiece.

Not every one can have all her kitchen utensils of aluminum ware, but many useful pieces can be had for ten cents each that will greatly lessen the work in and about the kitchen. The aluminum ware is very desirable as it is so durable, and then it is so easily kept clean and so light to handle.

The small funnel that is so indispensable in filling jugs, bottles, vinegar cruets, etc., can be had for ten cents in this ware.

There is the measuring cup also for the same price, in this ware, and it is marked off so one can measure dry or liquid materials accurately.

Also there is a small scoop to be bought, also in this ware, and for ten cents. It is often found marked, too. These are convenient in the sugar drawer or in the flour bin when only a small amount is wanted. They can be placed and used in various other ways, as they are so small and light.

An egg separator that will fit the top of a cup is also to be had for ten cents in aluminum, and it saves lots of time. Having this little labor saving device at hand, there is never any danger of the yolk getting into the white of the egg.

Then there is also the lemon squeezer that will fit the top of a cup. In this way one can squeeze the juice from a lemon into the cup and never waste time picking out the seeds from the juice. This handy little device costs only ten cents too and in the same ware.

The tea ball is also to be had for ten cents in this material. The tea is placed in the tea ball and allowed to remain in the tea pot or cup long enough to give the desired strength. In this way one can always have clear tea. If one does not care to use the tea ball, there is the dainty tea strainer in the aluminum ware

For the coffee pot there is a handy little receptacle with a long handle so one can lift it in and out of the coffee pot while the coffee is boiling hot. This also is to be had in aluminum and for ten cents. The coffee is placed in the receptacle and allowed to remain in the coffee until it is done. Then it is removed. It is not an improvement over tying the coffee in a rag? One can often save more than ten cents worth of time hunting for a rag by having this handy little device always at hand.

A doughnut cutter, biscuit cutter, plain and fancy cookie cutters can also be found in this ware and for ten cents. Sometimes one can often find the doughnut, biscuit and plain cookie cutter in this ware for ten cents combined. The handle is made so and arranged that it will turn to either cut doughnuts, biscuits or cookies.

Did you ever find you had a receptacle to clean where you disliked to place a whole bar of soap or even your hand? You can get the nicest little soap shakers in this ware for ten cents, and they are so convenient to use in such places. They are nice to use in the dish pan or to make suds to wash some dainty bit of lace. had for ten cents apiece in tnis ware,

Tea spoons and table spoons can be and they are indispensable to use in the kitchen for measuring and cooking. A good sized mixing spoon can often be picked up for the same price.

Then one can also get the plain and fancy individual moulds in this ware for ten cents each and they are nice to use in making desserts and various other dishes.

One can also get an individual drinking cup that is collapsible and it will be found just the thing for the child's lunch box, as it is so light.

Then there is a mug,too, with a handle for the baby to handle and often saves cleaning for the mother as there is less danger of the baby spilling it. It is often cut in a pretty design around the top to take away some of the plain look, yet it is as serviceable as ever.—Mrs. W. C. Palmer.

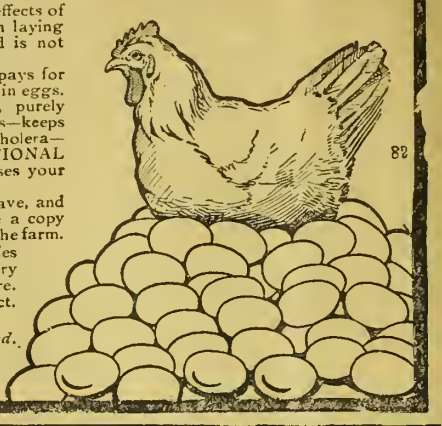
THIS IS THE WAY YOUR HENS WILL LAY WHEN YOU GIVE THEM

International Poultry Food

Right now is the time to feed INTERNATIONAL POULTRY FOOD. Hens need the tonic effects of this wonderful egg producer to start them laying and to keep them laying. Ordinary feed is not enough to make hens lay regularly.

INTERNATIONAL POULTRY FOOD pays for itself - over and over again—in the increase in eggs. It is not an ordinary food, but a tonic, purely medicinal. It actually produces more eggs—keeps fowls well and vigorous—prevents Chicken Cholera—cures Roup. Just feed INTERNATIONAL POULTRY FOOD and see how it increases your egg production.

Write telling us how many chickens you have, and what other stock, and we will send you free a copy of our $3,000 Stock Book. You need it on the farm.



International Poultry Food and Poultry Remedies also International Stock Food and Veterinary Preparations are for sale by Dealers everywhere. If your Dealer cannot supply you, write us direct.

All our goods are sold under a spot cash guarantee of your money back if not satisfied.

International Stock Food Co. Limited TORONTO ONTARIO

IT'S WASHDAY IN THE MORNING!

What does it mean to you? Is it a burden—a toil—a weary round of drudgery? Get a

Maxwell

"HIGH-SPEED CHAMPION" WASHER

and laugh at washday. Just put the clothes in. The washer does all the hard work. Clothes come out clean and white—better than if you spent hours scrubbing over a steamy tub. The Maxwell washer works with crank handle at side as well as top lever. Use which you like. Either way's just as easy.

Ask your dealer to show you the Maxwell High-Speed Champion. Also enquire about our Washers for Water, Electric or Gas Engine power.

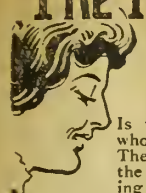
WOMEN CURED AT HOME

Women's disorders always yield from the very beginning of the treatment to the mild, but effective, action of Orange Lily. Within two or three days after commencing its use the improvement becomes noticeable, and this improvement continues until the patient is completely cured. Orange Lily is an applied or local treatment, and acts directly on the womanly organs, removing the congestion, toning and strengthening the nerves, and restoring perfect circulation in the diseased parts. In order to convince all suffering women of the value of this remedy, I will send a 35-cent box, enough for ten days' treatment, absolutely FREE to each lady sending me her address. MRS. FRANCES E. CURRAH, Windsor, Ont. 6

For Sale by Leading Druggists Everywhere.

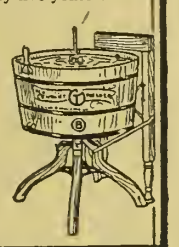
The "New Century" SMILE



Is worn by every housewife who uses one of these washers. The reason is quickly found for the New Century makes washing easy. It removes the hard rubbing and does the work more thoroughly than any other way.

The New Century Hand Washer works quickly and easily. It gushes the water through the fabric, leaving it sweet and clean in a few minutes. It cannot injure the finest garment you possess.

The product of twenty-five years experience in making washers, the New Century is without an equal. Patented features make it the leading hand washer.



Examine it at your dealer's or send to us for information.

HALLMAN FUR CO., Toronto Ontario

N. Hallman, Manager, 4 years with John Hallam; E. J. Hagen, Treas., 11 years with John Hallam; J. L. Jewell, Buyer, 6 years with John Hallam; G. Hagen, Secy., 7 years with John Hallam.

Family Home Fireside.

There is no other joy in life like mental and bodily activity, like keeping up a live interest in the world of though and things. Old age is parctically held at bay so long as one can keep the currents of his life moving. The vital currents, like mountain streams, tend to rejuvenate themselves as they flow.

I still find each day too short for all the thoughts I want to think, all the walks I want to take, all the books I want to read, all the friends I want to see.

(So says John Burroughs at the age of seventy-six.)

"LET THE SIPHON DO THE WORK

It is wash day; you have a boiler full of water and are going to dip it out into the washing machine or wash tub.

Don't do it; let it "do itself." Your son or daughter who is studying physics could tell you just how to do it.

First the washing machine or tub must be lower than the boiler.

Have a piece of hose long enough to extend from the bottom of the boiler into the wash tub.

Fill the hose with water and stop one end with a cork.

Hold the hose so that the water does not run out of the other and put that end carefully into the water in the boiler.

Put the other end into the wash tub and remove the cork. The water will flow.

If the water in the boiler were not so hot, both ends of the hose could be corked, and the cork removed by the hand underneath the water.

If a slight weight is tied to each end of the hose it will stay in place more securely.

This is really a very simple proccess. The edge of the boiler is the highest koint of the hose, the top of a hill, as it were. When the end of the hose in the wash tub is opened, the water in the hose runs down this hill just as any right minded water would. The water in the hose from the edge of the boiler to the surface of the water in the boiler would not naturallly follow since it would be up hill, but the water running out of the otner part of the hose makes a vaccuum and the pressure of the air on the surface of the water in the boiler forces the water up the hose into the vaccuum, thus establishing a continuous flow. The flow will continue until all the water is emptied from the boiler if the hose extends to the very bottom. You can go on about other work and let the boiler empty itself.

This principle of the siphon can sometimes be put to various good uses. In one case it proved a friend indeed.

A rain water tank was situated under the flow of a third story. A leak appeared; the problem was to empty the tank in the quickest possible time. Of course, the faucets were opened, so that it would run out by its legitimate channels as fast as possible. In addition it was siphoned out by a long hose carried from the tank out of a window and down to the ground.

In another case a cistern was emptied by means of a hose acting as a siphon. This was possible only because the cistern was on the side of a hill and the hose could be carried down the hill so that its outlet was lower than the water in ths cistern.

We may not need the siphon in any unusual way, but we can all let it empty the boiler for us, which is much rasier than doing it by muscle power.

Butter Your Bruises.

We always expect a bad bruise to be followed by extreme discoloration of the tissue. Yet this annoying after effect can be prevented. Simple butter will do it. Immediately upon receiving the bruise rub butter, plenty of butter into the tissue. Keep the spot well covered with butter for perhaps two days or until the severe soreness is past. Strange as it may seem there will be no discoloration whatever. If butter cannot be had use cold cream or vaseline. They will help, but are not as effective as butter. This sounds too simple to be true, but prove it the next time you have need.

Moisture in the Air.

Many times people are troubled as winter comes on with a very annoying itching of the skin. This is often attributed to the heavier underwear, especially if it is wool, and that is the cause in some cases. Much more frequently, however, the cause is lack of sufficient moisture in the living rooms.

...

It is not enough that we guard against too high a temperature. We must also watch lest the air become too dry and unwholesome for that reason. A hygrometer will show the degree of humidity and it should be kept at 50 or above. Most furnaces have a receptacle for water. This should be kept filled. There are on the market various kinds of receptacles to be attached to radiators, but anything that will hold water and present a broad surface for evaporation will answer the purpose equally well.

Cause of Colds.

Besides the germ which is the exciting cause of the cold there are contributing causes, such as sudden exposure to cold, exposure to hot stuffy air, overfeeding, underfeeding, failure of the organs of elimination (bowels and kidneys) to carry away all waste products, errors in clothing, over indulgence in alcohol stimulants. —Dr. W. A. Evans.

"FAVORITE" CHURN (with Bow Lever)

Notice the adjustable handle on the bow lever. No other churn has this. Handle can be moved to centre or either side, whichever is most convenient for driving.

You can buy the "Favorite" in eight sizes. Strongest and best made churn on the market. Easy to work. Gives splendid results. Ask your dealer.

DAVID MAXWELL & SONS ST. MARY'S, ONTARIO 1

Cheese Fondu.

1 cup crumbs.
1 cup milk.
1 cup grated cheese.
¼ teaspoon white pepper.
1 egg.
½ teaspoon salt.
¼ teaspoon white pepper.
1 egg.

Scald milk in double boiler and add bread crumbs to it. Then add grated cheese, melted butter and seasonings. Cook in double boiler until cheese is melted; add the slightly beaten egg gradually. Cook five minutes and serve on dry toast.

Baked Cheese With Egg.

4 eggs.
1 cup grated cheese.
1 cup soft bread crumbs.
¼ teaspoon salt.
Few grains cayenne.

Break the eggs into a buttered baking dish and cook in hot oven until they began to turn white around the edges. Then cover eggs with white sauce and over this the mixture of cheese, crumbs and seasonings. Brown in very hot oven so eggs will not be overcooked by time cheese is brown.

Cheese Omelet.

Yolks of two eggs.
2 tablespoons hot water.
1 cup grated cheese.
Salt and pepper.
Whites of 4 eggs.
1 tablespoon butter.

Beat egg yolks until lemon colored; add the hot water and seasonings. Beat the whites until stiff, then add the cheese. Cut and fold the two mixtures together, beat the butter in omelet pan. Add the mixture and cook very slowly until brown on under side. Brown top of omelet lightly in hot oven.

Help the Mail Service.

Every man, woman and child who starts a letter on its way can help the mail service and save the eyes of hundreds of men.

Address your letter very plainly and in good black ink. Poor writing and pale ink cause delay and tax the eye sight.

How to Avoid Catching Cold.

Being very subject to catching cold on the slightest provocation, I am for that reason well qualified to instruct others how to avoid it, and how to check it when contracted. The fact that I am seldom successful in keeping at bay any chill that glances in my directian is no disparagement to the prescriptions, for two reasons; constitutional tendency first; and a carelessness that goes on working under the most unfavorable conditions, thinking, "Oh, it will go off!" or, "Bother, I haven't time to fuss today, I'll take a hot drink perhaps at night." Perhaps! But my wise readers scent the chill when it first breathes through them, and double bar the door against it, thus:

At the first suspicion of a chill, take 5 drops of camphor on a lump of sugar every few hours or a teaspoonful of ammoniated tincture of quinine in a wineglass of water. At bed-time, bathe the feet and legs in a very hot water and drink at the same time a good basin of hot milk gruel; undress quickly, put an oiled flannel on the chest, and a dry, hot flannel over that, get into a warm nightgown, and then into a warmed bed, and rejoice when the perspiration oozes profusely from every pore. On getting up next morning sponge the whole body with cold water, and rub briskly with a rough towel till the flesh glows.

To harden the skin against changes of temperature, take a cold sponge bath every morning; or, if this is not convenient, or too much of a shock in cold weather, at least sponge the face, neck, chest and arms, and dry vigorously with a coarse towel. Formanint tablets are much recommended as an antiseptic against the infectious germs which attack the respiratory passages; but the one person I know who used them regularly died of pneumonia. That sounds pessimistic. But experience prevents me from being optimistic.—Gretchen.

Home Hints.

TO SMOOTH THE FLAT-IRON.—Glue down a piece of linoleum on a board 6in. wide and 1 ft. long. Bore a hole at one end for hanging it up out of the way when not in use. When a flat-iron has got smoky and sticky just sprinkle a little fine salt on the board and rub the face of the iron on it. It smooths and cleans the iron at once.

A NEW TIN KETTLE.—It requires very careful and thorough cleaning before any water from it is used for drinking or cooking purposes. Nearly fill it with water, and put in a knob of soda. Stand it aside on the kitchen hob where it can gradually boil. Afterwards pour away the stale liquid and refill with clean water. Allow this to slowly boil, then follow with several rinsings of clean water.

Dr. Morse's Indian Root Pills

are made according to a formula in use nearly a century ago among the Indians, and learned from them by Dr. Morse. Though repeated attempts have been made, by physicians and chemists, it has been found impossible to improve the formula or the pills. Dr. Morse's Indian Root Pills are a household remedy throughout the world for Constipation and all Kidney and Liver troubles. They act promptly and effectively, and 49

Pulping Fruits.

An industry parctised in Europe but only started in America. The pulping of fruits which has been practised in Europe especially in France for years past as an important industry has hardly been started on this side of the ocean.

The object of this practise is to con vert various kinds of fruits into a condition into which they may be preserved for shipping long distancee for use in the prices are highest. Many hundredweight of black currant pulp is produced annually in France and is used largely in confectionery. The pulps of cherries, raspberries, red currants, and plums, in fact any kind of fruit may be pulped and are used on a large scale. The workers employed become very rapid in the different processes being able to remove the stems from 110 to 220 pounds of currants in a day; and an average operator can pulp about eleven pounds of cherries in an hour. After the removing of the stalks and pits in the process of pulping, the pulp is sterilized and packed in air proof bottles, care being taken to avoid actual cooking.

In the case of the pulping of the apricot it is interesting to note that the pits are dried and broken, the kernels being sold for the manufacture of "extract of bitter almonds," a familiar flavoring.

It is possible that the practise may in time become an industry in these parts of America where fruit grows abundantly and the needless waste of the fresh fruit might in this manber be turned into a source of wealth.

To the housewife this pulping of fruits is of great importance for in many cases fresh fruit may be thus preserved when canning is not desirable and stored in glass jars for future use. Reference to the various methods of using such fruit pulp has been mentioned in last isue.

In a later article the pulping of vegetables will be discussed and recipes given for its use in the household.—D. E. H.

Here is a remedy that will cure cure your cold. Why waste time and money experimenting when you can get a preparation that has won a world-wide reputation by its cures of this disease and can always be depended upon? It is known everywhere as Chamberlain's Cough Remedy, and is a medicine of real merit. For sale by all dealers.

New I. C. R. Station at Truro.

Truro, N. S., has a new station building of which it is justly proud, and which adds very greatly to the appearance of the town. It is the finest station building on the line of the Intercolonial.

The new building is the third Truro has had since railroading began in Nova Scotia. The first was opened in 1855 when the old Nova Scotia railway was completed from Halifax to Truro. It was a fair enough structure in the pioneer days of the "iron horse," but something new was determined on in 1871, when the Intercolonial railway was completed and Truro became a more important junction point. The second station was for several years through a sufficiently adequate for all the business, but it needs only a glance at it today to realize how far such a structure fell short of the modern demand for station facilities and accomoda. tion. The new building is a handsome and commodious structure of red sandstone, with rock faced body and dressed trimmings. It has a length of 338 feet, the cent(al part

Advertise in The Maritime Farmer.

being 137 feet long, 56 feet wide, surmounted by a tower on the street side 19 feet square and 78 feet high. The foundations are of concrete and the floors of reinforced concrete and structural steel. The roof is supported on steel roof trusses and is built of slow burning wood covered with pitch and gravel. A ten foot verandah supported on structural brackets with roof covering of asbestos shingles, extens along the whole track front and around the two ends affording outside shelter and shade. Inside the building is handsomely equipped on a scale more artistic than the Intercolonial has previously attempted. The ground floor of the central part contains the general concourse, 52x51 feet with a ceiling 19 feet high. The main street entrance is through the tower while there are two entrances from the station platform and side entrances and the floors of apartments leading from it are of "Terrazo" on top of concrete. The walls for a height of 7 feet are tiled, the upper part and the ceilings being done in rough cast plastering with finished cornices, beams, etc. All the wood furnishings are of quartered golden oak. The ticket office is a handsome structure with an oval front and an art glass canopy roof, and has ample window accomodation for the growing needs of traffic. Off the main concourse is a finely appointed ladies' parlor and lavatory, telegraph office and station master's office. A passage runs from the concourse into the restaurant and dining rooms. The main restaurant is 57x30 feet. The furnishings of these rooms are very attractive, and the kitchen and pantry equipment the most modern that could be obtained. The baggage rooms, express offices, mail room and conductor's and trainmen's rooms are in the southern extension.

On the second floor of the central part of the building are located very fine offices for the use of the divisional superintendent and staff, the chief dispatcher and his operators, the divisional engineers and trackmaster. The Webster modulation system of heating is used throughout the building.

The plumbing is installed according to the most modern sanitary methods. Special attention has been paid to the electric lighting, the wiring being carried in conduits and the fixtures in excellent taste. The lighting will be found ample in the waiting rooms so that the passengers while resting there can read comfortably. Most comfortable are the large open fire places in the ladies' parlor and the men's smoking room.

In the spring it is the intention to extend the concrete esplanada all around the building, and grass plots with flower beds will grace the town side. The local trains will be dispatched from each end of the station where ample track accomodation will be constructed as soon as the old station is removed from its present site.

Some New Quirks in Farming.

It is a peculiar fart that some farmers won't think anything of throwing $1,450 into a new red barn and let their wives get along with a kitchen range that won't cook anything but shredded wheat biscuit. There are too many men in this country laying $70 cement floors in the hog barn and making their wives put up with a rag carpet in the parlor that has been patched every spring for 19 years. If we had a hasband who spent all of the money on corn cribs and doled out pocket money in two-bit pieces, we would meet him at the gate some peaceful summer evening and separate him from his pocketbook with a rolling pin. If the wives of some men had more spunk, there would be fewer patented water tanks for the pigs and more crintz curtains in the parlor bedroom.

You can't produce a corn crop by hanging both legs over a cracker box and discussing Schedule K. The man who would rather consort with a pool table than a corn cultivator is generally the one who has to slap a third mortgage on the back 40 in order to raise the first payment on an automobile.

We read in the papers the other day of a farmer in a neighboring county who attempted to play a joke on a tall gaunt Jersey heifer by milking her on the wrong side. The Jersey has no sense of humor whatever and on this occasion she promptly introduced the milker to the evergreen shore by stepping on the side of his head and flatening it out like a palm leaf fan. No doubt the deceased was one of those farmers who went broke in the grocery business and finally graduated to the farm.

(Continued on page 240)

YOU may have an idea because western wheat flour makes a big loaf of bread, that the quality is in keeping with the size. The largest men have not accomplished the greatest deeds.

Size is the only feature that can commend western wheat flour to any cook. And the good cook quickly discovers that quantity without quality is not worth buying.

"BEAVER" FLOUR GIVES BOTH QUALITY AND QUANTITY, because it is a blended flour. It is mostly the choicest Ontario fall wheat with sufficient Manitoba spring wheat to equalize the strength.

In "Beaver" Flour, you get the famous pastry-making qualities of Ontario wheat—you get the fine texture, the evenness and the delicious flavor of Ontario wheat—you get the nutriment of Ontario wheat—with the "strength" of Manitoba wheat which makes the dough "stand up" in the oven.

One of the big conveniences of "Beaver" Flour is the fact that it is equally good for bread and pastry—and best for both.

"Beaver" Flour is superior to any western wheat flour for any and all kinds of baking, and is the cheapest flour you can use because the most economical.

Sub-Soiling With Dynamite.

The United States Department of Agriculture issued on March 26th, Bulletin No. 92, entitled "Wells and Sunsoil Water," by W. J. McGee, expert in charge of subsoil investigations.

This bulletin is of great importance to every citizen because, as it states in its opening paragraph, the habitability of any continent depends on its water supply—no water, no plants; no plants, no people.

The bulletin is an exhaustive treatise of 185 pages and the data therein covering 31 typical states, show that the subsoil water level is lowering at the rate of 1.422 per decade, as determined by the height of water in the wells.

The author concludes from the statistics and observations that the chief causes of this lowering of water level are: (1) Clearing the land of forests. (2) Heavy consumption of water by manufacturing plants, artesian wells and by the increasing population. (3) Improper methods of farming whereby the rainfall is not conserved in the subsoil.

In suggestng a remedy for this threatened water famine and increasing tendency towards protracted drouths, the author observes that the first cause cannot be corrected except in a small way by forestry; that the second cause cannot well be corrected because of the needs of the population and that therefore the obvious remedy consists in improved methods of soil cultivation that will prevent the surface run-off of rainfall.

The means suggested to prevent such surface run-off is to adopt measures whereby each farm shall be "made to take care of all the water falling on it during the entire year; and all that part of the water not needed for immediate crop growth or cistern or other supply, should be so caught and absorbed by mulch or well-tilled soil or contour furrows and ridges as to pass into the ground, there to be stored against need for the steady supply of stream through seepage and for the gradual restoration of the sadly depleted reservoir of subsoil water."

Progressive farmers everywhere are alive to the advantages of growing plants in an absorptive soil, as it tends to prevent wet weather saturation of the top soil, or dry weather drouth.

Until recently, deep plowing with a subsoil plow or other deep tillage machinery was apparently the only means of increasing the absorptive power of the soil, but the plowing of soil to a depth of from 12 to 18 inches is accomplished only with great difficulty and considerable expense. Within the last two years, however, the general introduction of dynamite in agriculture has demonstrated that the best means of increasing water storage capacity of the subsoil is by blasting it. Blasts of a half-cartridge or a quarter-pound of low grade dynamite placed in bore ho,es to a depth of about three feet will break up the most impervious subsoil in a spongy mass. In lact, English agriculturists describe this work as the establishment of "soil sponges."

In ordinary subsoil where the charges are placed at adistance of 15 feet apart, these "soil sponges" over-lap as the explosive has an average radius of efficiency of 10 feet. Thus the whole area blasted becomes an enormous earth sponge six to eight feet deep and the water storing capacity of an acre of land so treated is increased by many tons. This does not create a mucky condition of the land On the contrary, it produces a condition most favorable to plant growth.

When heavy rainfalls occur the water, instead of washing off the valuable surface soils into streams, clogging them and making navigation more difficult, sinks into the ground and remains in storage until the dry weather exhausts the moisture in the top soil. The stored water then begins to rise by capillarity, carrying the plant through the protected drouths that are now causing millions of dollars loss every year in this country.

Further, this subsoil blasting makes available for solution in the constantly moving soil water, tons of natural plant food, otherwise unavailable, because not in solution. This is no longer a theory but an established fact as shown by largely increased crops where subsoil blasting has been properly done. The chief precaution to be observed is that the blasting be done when the subsoil is dry, because then the shattering or sponge creating effect of the blast is greatest, whereas in wet subsoil the blast tends to form a small pot hole packed tight around its periphery.

It is worthy of note in this connection that the cnief cause of the disastrous floods that have recently occurred in this country, is the lack of absorptive power of the soil and the denudation of the land by clearing. As the majority of farm soils that have not been opened up by blasting of subsoil plowing will absorb only a small portion of the rainfall, it is obvious that there is an excess run-off of surface water which has no let excepting the small streams and they in turn empty into the large rivers and cause, in a few days' time a rush of water which the largest river channel is incapable of handling.

If subsoiling with dynamite were practiced generally throughout the country, it is not too much to expect that these disastrous floods would be a thing of the past.

The Use of Iodine.

Dr. A. S. Alexander, the well-known American veterinary authority advocates a more general use of iodine both as a tincture and in ointment form. For bites of poisonous insects and for germ infections of various sorts he finds treatment with tincture of iodine to give good results. He says:

"Tetanus often kills horses that simply have collar or saddle sores. The owner daubs the parts with axle-greese or some smear, salve or ointment, thereby excluding air. Better saturate the wound with tincture of iodine, or with 1-500 solution of corrosive sublimate, which is deadly to all germs and the spores of some of the worst diseases, notably anthrax.

"Use iodine freely if a boil is starting on man or beast, and particularly on what the farmer often terms a blind boil. By this he means one of those angry, sore, dark-red or purple bunches which does not readily come to a head. Such an infected center has come from the entrance of a germ, or the bite of an insect. Flies from the carcasses of animals may cause them. They may turn into malignant pustule from the bite of an insect. They most commonly come from infection from pus, blood or other discharges getting onto the hands, when one treats a wounded or diseased animal. They are often contracted at hog killing or cattle-butchering time—the knife or a bone scratching or cutting the hand. Saturate such wounds with tincture of iodine and repeat the application once or twice daily, until the wound heals and there is no sign of infection. This is home treatment; it always is best, of course, to employ the physician in serious cases of emergency or where neat danger is thought to exist.

Iodine tincture is also a great value in the tteatment of all grandular swellings and in lumpy jaw (actinomycosis) Goitre on the neck of a young animal is well-treated painting the swellings with tincture of iodine, or rubbing them with iodine ointment every other day. Iodine in another form—the iodine of potash—also is used in sulch cases being given internally in small doses for a few days.

The tincture and iodine are sovereign remedies in wooden tongue (actinomycosis of the tongue) of cattle. The enlarged tongue is sacrified light ly and ulcers are scraped. Then tincture of iodine is applied and repeated in a few days. Iodine of potash is given internally, in one dram doses two or three times a day, for several periods of ten days to two weeks, with similiar intervals without the medicine, until the disease is cured. The drug causes iodine poisoning (iodism) when given in these large doses for the time mentioned, and the intervals without treatment are inl tended to allow recovery from iodism before again giving the medicine.

"Similiar treatment is given in lumpy jaw. The tumors and abcesses are opened freely, swabbed with tincture daily, or packed with oakum or cotton soaked in the tincture, and the iodine of potash is given internal ly as in treating wooden tongue. Tincture of iodine and the ointment of iodine are of great value in the reduction of all chronic swellings. Use them on puffs, such as windgalls and bog spavin on curbs, on enlarged tendons, on forming spavins, splints and ringbones. The tincture also should be used on or in wounds that are tardy in healing, and is very useful for injection, now and then, into the fistulae of the withers and poll. It likewise is eective in the treatment of canker of the mouth, and in snout disease(bull-nose or snuffles) of swine."

The Farmer a Great Help.

Sheffield Mills, N. S., Nov. 11, 1913.
Editor Maritime Farmer.

Sir:—

Enclosed please find 75c. for two paper has been coming to us insertions of the enclosed advertisement in the 1c. per word column of your paper. I may say that your your paper has been coming to us for quite a few years and that it is a great help as it is nearer home and understands our conditions better than any other farm papers we have.

Do you take in any ads. for one or two insertions on last page such as "Cobequid Farm's" adv. and if so at what rate? I remain,

Yours truly,
W. C. ELLS.

Propagation of Plants from Cuttings.

A knowledge of the propagation of plants is of great importance, especially horticulturists and farmers Since by doing their own propagating they can obtain plants better acclimated at a lower price and avoid the introduction of dangerous pests.

Plants are propagated by natural and artificial means, the latter method will be discussed in regard to their reproduction by cuttings.

A cutting is a detached portion of a plant that will take root and reproduce its kind if set in the soil. They may be divided conveniently into three classes, viz., root and tuber cuttings; greenwood, herbaceous or soft wood cuttings, and ripened or hardwood cuttings.

ROOT AND TUBER CUTTINGS.

Tubers and thickened portions of roots and stems. The Irish potato is a good illustration of a tuber. Generally roots do not arise from the tubers themselves, but from the sprouts. At least one eye should be left in an Irish potato cutting, but in the case of the sweet potato no sprouts are present and all that is necessary for growth is a piece of the "skin" or apidermis with each cutting. Root cuttings are commonly made from plants that show a tendency to "suck er," such as plums, raspberries and blackberries. Most root cuttings possess no buds before planting, the buds developing later. Cuttings, one to three inches long, are made from the roots and planted horizontally in the soil. Cannas, paeonies and rhubarb are also propagated from root cuttings. Canna cuttings can be planted in the open field, but more certain results will follow is started in the house. Paeonia cuttings are planted in the spring about two inches below the surface of the soil. Rhubarb is very easily grown from cuttings of the roots in spring. Horse radish is propagated by simply cutting the roots into four to six-inch lengths. All root cuttings come true to name.

SOFT WOOD CUTTINGS.

Many greenhouse plants, including roses, geraniums, begonias, chrysanthemums and carnations are propagated from soft wood. Many deciduous. ornamental shrubs and trees can also be started in this way. Herbaceous cuttings can be made from the leaf or stem. Commonly plants with fleshy leaves, such as the begonia, are multiplied by leaf cuttings. These cuttings will strike root in moist sand after which they should be trans ferred to pots containing a light soil and an admixture of leaf mould.

Stem cuttings are made from the tips of branches. Some prefer to make them long; other, short. The tip and bottom leaves of the cuttings are removed to prevent to rapid transpiration of moisture. On hot, sunny days, unless protected from the direct rays of the hot sun, transpiration takes place so rapidly that the leaves wilt, as the cells do not hold enough water to keep them distended. A wilted soft-wood cutting is almost certain to die. A few leaves should be left on a green wood cutting, since they are as essential to its growth as lungs are to the life of a man. Cuttings from ornamental shrubs, as spireas, hydrangeas, honeysuckles, roses, gooseberries, etc., can be made from the tips of growing branches the early part of July. Hardy Perpetual rose cuttings are made about one and one-half inches long from wood grown in the greenhouse. Other cuttings are best when made five to eight inches long. They are then set three to four inches deep in sand benches six inches deep in the greenhouse. Sand sifted through a quarter-inch mesh sieve is best, as most soft wood cuttings require coarse sand. After set out in the bench, a heavy stream of water from the hose is given to wash the sand around the cuttings. They are left in the benches for about ten days, or until they have calloused, and then set into two-inch pots. Later the cuttings are transferred to flats. Late in the fall the flats are put into a cool cellar for the winter. In the spring the plants are transplanted into nursery rows.

HARD WOOD CUTTINGS.

Hardwood cuttings are made from ripened wood of the present or previous season's growth. They are generally made in the fall, tied in bundles of twenty-five or fifty and wintere in the cellar in moist sand. In the spring they are planted out in the field in a slanting position. Currants, grapes, willows, poplars and dogwood are commonly propagated in this way. The length of hardwood cuttings vary from six to ten inches. Grape cuttings are cut so as to have three buds. A currant cutting the same length has ten to fifteen buds.

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials,
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my **free** ten days' trial of a **home treatment** suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men **cannot** understand women's sufferings; what we women know **from experience**, we know better than any doctor; and thousands have proved there is **hope** even **for the hopeless** in my method of home treatment. If you suffer from **pain in the head, back,** or **bowels, feeling of weight** and **dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send to-day for my complete **ten days' treatment** entirely **free and postpaid,** to prove to yourself that these ailments can be easily and surely conquered at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and **when you are cured,** my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—**young or old.** To **Mothers** of **Daughters,** I will explain a simple home treatment which speedily and effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer, **write for the free treatment** suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. **Write and ask** for the **free treatment to-day,** as you may not see this offer again. Address:

MRS. M. SUMMERS, Box 309, WINDSOR, ONTARIO.

Nerves Were Unstrung.

WOULD ALMOST GO OUT OF HER MIND.

Many women become run down and worn out by household cares, and duties never ending, and sooner or later find themselves with shattered nerves and weak hearts.

On the first sign of any weakness of the heart or nerves you should avail yourself of a perfect cure by using Milburn's Heart and Nerve Pills.

Mrs. Archie Goodine, Tilley, N.B., writes:—"When I was troubled with my heart, two years ago, I was very bad. My nerves were so unstrung, sometimes I would almost be out of my mind. I doctored myself with everything I could get, until at last I got four boxes of Milburn's Heart and Nerve Pills, and they have cured me. I cannot speak too highly of this wonderful remedy, and will recommend it to all sufferers."

Milburn's Heart and Nerve Pills are 50c. per box, or 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

FARMER ADS. BRING RESULTS.

Some New Quirks in Farming.

(Continued from page 237)

We would rather slide into a hornet's nest on a pair of linen pants than try to pail an irascible milch cow on the wrong side. The man who doesn't know which side of a cow to milk on had better move back to town and hire out to the street commissioner. Poets like to sing about "the mild-faced Jersey standing knee deep in June," et cetery, but if you ever snuggle up to a Jersey on the off side and try to induce her to come across, she will land on you with so much emphasis that you will have to be put together by a plumber.

What has become of the old-fashioned farm wife and mother who used to get up at 5 o'clock Sunday morning, get the work out of the way, dress herself and the children and pack the whole family six miles to church, rain or shine? Well, she is with us yet, but now the family goes in an auto and doesn't have to leave home until the first bell has rung. We remember a faithful old family in Israel who used to drive in from the farm with her little brood every Sunday morning and evening, sometimes over roads that it seemed as if nobody could get over except a sand hill crane. Meanwhile, a lot of the members who lived within two blocks of the church never could get there when it rained for fear they would get their feet wet. If the recording angel keeps track of the faithful farm people who are loyal to the little church in the settlement, in sunshine and storm, they will have a seat mignty close up to the throne.

There are only two ways to make profitable use of skim-milk. One is to feed it to near-sighted pigs who are not particular about their diet, and the other is to sell it to some neighbor, who doesn't keep a cow. Some people drink skim-milk and try to look as if they liked it, but that only shows that they never lead their appetite up to a bowl of the real article from a three-quarter Jersey three weeks on grass.

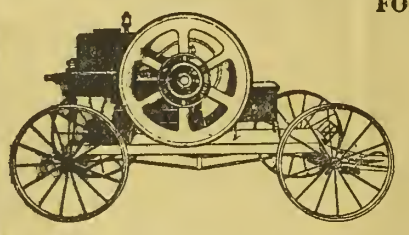
Benjamin Franklin once said: "You can drive a horse to water but you can't make him gargle his throat," or words to that effect. The same is true of humans. A man or woman can't work 14 hours a day for 365 days in a year without growing gray hair, wrinkles and crowsfeet faster than Yellow Dent corn. If farm folks, and town folks, too, would take their noses off the grindstone oftener, they would live longer and their tempers would be sweeter. All work and no play makes Jark a dull boy and a sour boy and a grouchy boy.

An incubator advertisement says that the old "setting" hen is going out of business and will soon be replaced by the blue-flame brooder. We don't know about that. It will be some time before the "setting" hen will be retired from circulation. The incubator is all right, but nobody would ever mistake it for a mother. The incubator can't gather its offspring under its wings and fight a chicken hawk to the ropes, and it can't turn up a fat, juicy worm and feed it to one of the children. We have an idea that the "setting" hen will be in our midst for some time yet.

The best remedy for a hired man who oversleeps in the morning is to tie one of those self-tripping alarm clocks to his right ear. If this fails to wake him up, set fire to the bed. Sometimes the hired man will have a snore which would drown out any alarm clock ever invented, and in that case it is better to replace him with one whose slumber doesn't sound like a motorcycle race at the county fair.—Kimball's Dairy Farmer

FOR YOUR FARM, YOUR HOME, YOUR FACTORY

FOR EVERY POWER PURPOSE, A



GILSON

"GOES-LIKE-SIXTY"

ENGINE

MORE VALUE, MORE POWER, MORE SERVICE, MORE SATISFACTION

Does satisfaction mean anything to you? Does money saved in fuel, in time, in repairs and expense bills appeal to you? Get Gilson Facts, and find out how the Gilson 60-SPEED engine does the greatest variety of work—how it gives the maximum satisfaction—saves money in equipment, and yields 100% service at lowest cost. Every engine covered by a cast-iron guarantee.

NEW FEATURES AND LATEST IMPROVEMENTS

The new Gilson 100% SERVICE ENGINES, 4 HP and upwards, are equipped with our new friction clutch pulley with five interchangeable rims, each of a different diamcter. Change to the proper speed for every job in a few minutes. A NEW and EXCLUSIVE GILSON FEATURE. These engines are also equipped with a magneto, without batteries or coil, with spark retarder,—no cranking necessary. A child can start them.

We also make 60-SPEED engines in 1½ and 3 H P sizes. These are mounted on truck, with line shaft and five interchangeable pulleys, and pump-jack. Drop us a card to-day, and we will send you full descriptive literature. We are making special prices to the first purchaser of one of these engines in every locality. Write NOW.

Make Your Stock and Poultry Pay Better with

Royal Purple

STOCK AND POULTRY SPECIFICS

At a cost of less than a cent a day per head of stock, it will increase their value 25 per cent. Permanently cures Colic, Debility, Worms, Bots and Skin Diseases. Tones up run-down animals so that they quickly gain weight and vigor. Increases the yield of milch cows three to five pounds a day, besides enriching the quality of the milk.

ROYAL PURPLE is not a food. It is a conditioner—the best ever sold. If there was any better we would be making it. It enables your stock to eat the natural food they should eat and get the most benefit from it. Here is the advice of all thorough veterinary doctors—"Feed your stock on food of your own growing"—not pamper them with soft predigested mush so that after a time they cannot digest good, wholesome feed. Feed the good food grown on your own farm—hay, oats, bran, chop, etc. You know what these things cost you and what they will do.

ROYAL PURPLE is an aid to these natural foods and if you use it as directed, we can guarantee better results than if you feed any of the concoctions offered on the market as "prepared foods."

Try It On a Poor-Conditioned Animal

If there is a run-down, poorly nourished beast on your farm, see what **ROYAL PURPLE SPECIFIC** will do for it. A 50-cent package lasts a cow or horse 70 days. The cost is so trifling that no farmer in Canada has any excuse for having out-of-health stock around his place. Try it on the poorest-conditioned animal you have and we know you'll be surprised at the result of a short treatment. Cattle and hogs fatten up a month earlier than without it, which means you save a month's feed and a month's labor. You can bring six pigs to the pink of condition at the cost of $1.50. Steers treated in the same way cost no more than $1.00 each to put in prime state for market. **ROYAL PURPLE SPECIFIC** fattens and keeps well horses, mares, colts, cows, calves, steers, hogs. Sold in packages, 50c, and air-tight tins, $1.50.

Try ROYAL PURPLE POULTRY SPECIFIC on Your Hens

Do you know that **ROYAL PURPLE POULTRY SPECIFIC** makes hens lay in winter as well as in summer, and keeps them free from disease? It does, and helps them over the moult, fattens and keeps them in vigorous health. A 50c package lasts 25 hens over 70 days. Shouldn't you try it? We have hundreds of recommendations from all parts of the country. If **ROYAL PURPLE** does not give you better results than anything you ever used, or give you satisfaction, we will refund your money. No matter what your opinion of other preparations, we want you to give **ROYAL PURPLE POULTRY SPECIFIC** a chance to show what it can do for your poultry—and a 50c package will show you some fine results. Sold in 25c and 50c packages and $1.50 air-tight tins.

WE ALSO SELL

Royal Purple Cough Specific for cough and distemper. (Will cure any ordinary cough in four days). 50c, by mail 60c.

Royal Purple Sweat Liniment for lameness, rheumatism, sprained tendons, etc. 50c, by mail 60c.

Royal Purple Worm Specific for animals; removes the worms, also their larvae. 25c, by mail 30c.

Royal Purple Disinfectant, in 25c, 50c and $1.00 tins.

Royal Purple Lice Killer for poultry and animals. 25c and 50c, by mail 30c and 60c.

Royal Purple Gall Cure for scratches, harness scalds, open sores, etc. 25c and 50c, by mail 30c and 60c.

Royal Purple Roup Specific for roup, pip, diphtheria, typhoid fever, canker, white diarrhoea, swelled head, etc., in poultry. 25c, by mail 30c.

Free

TO STOCK AND POULTRY RAISERS

We will mail for the asking our new revised 80-page book on common ailments of stock and poultry. Tells how to feed light and heavy horses, colts, mares, cows, calves, steers, hogs; also how to feed and keep poultry so that they lay winter and summer. Cover lithographed in six colors, showing farm utility birds in their natural colors. This is a book that should be in every farmer's possession. IT'S FREE. Write for your copy today.

KENDALLS
SPAVIN
CURE
To Bring Him Back to the "High-Stepping" Class
THE REMEDY USED ALL OVER THE WORLD
For Spavin, Curb, Splint, Ringbone, Soft Bunches, All Lameness

Horse dealers have made thousands of dollars by buying Lame, Spavined Horses, curing them with Kendall's Spavin Cure, and then selling the sound animals at a handsome profit.

You can do the same with your own horses. Here is one man who saved his horse and his money by using **Kendall's.**

Oak Bay Mills, Que., Dec. 15th, 1909
"I wish to inform you that I have used Kendall's Spavin Cure with good success, on my horse. I found that it cures quickly and well". Yours truly, ROY HARPER.

$1. a bottle—6 for $5. A copy of our book—"A Treatise On The Horse"—free at dealers or from us. 48

Dr. B. J. Kendall Co. - - Enosburg Falls, Vt.

Dry Rot of Horses Feet.

W. C. D.: Will you kindly tell me through the columns of the Maritime Farmer what may be the matter with my horse's hoof and what should I do to effect a cure. She has heen very lame since last spring, so lame that it was impossible to use her at all. The under part of her hoof is very hard and if you tap it it sounds as if it were hollow inside. I bring her to the blacksmith now and again and he tells me that the inside of her hoof is affected with a dry rot. I showed her to a veterinary surgeon but he did not seem to know what ailed ker. He told me to blister her around the hoof and poultice her under the hoof. Trusting to get your answer soon and thanking you in advance.

I have read your letter very carefully and am of the opinion that you have a condition termed "canker" which is sometimes known as "dry rot," the term applied by your blacksmith. This is a disease of the horny portion of the sole of the foot and is very often the result of some acute or chronic inflammation in the structures above it. It is necessary to go into a little discussion regarding the anatomy of the foot in order to explain my meaning.

The insensitive or horny portion of the foot of the horse is called the sole. This sole structure is a separate growth to the wall, or that part of the foot seen when the foot is on the ground. The sole grows from a horn secreting tissue which is very sensitive and richly supplied with your mare has navicular disease (cofblood vessels. In all probability fin joint lameness) which is an inammation of the ligaments and tendons comprising the jo nt in the heel of the foot. The inflammation in thise structures would affect the bload circulation of the vascular surfaces below it. Hence, as you will see, the function responsible for the elaboration of the sole would be serious,y impaired by these changes taking place, and as a result a portion ot the sole would die.

I would invite vterinary assistance because there are two conditic s to he looked into: the first to find out whether navicular disease is present, second to treat the condition which does exist. The operation necessary in treatment of canker of the sole is rather formidahle and cal,s for complete extirpation of the diseased portion of the sole, a procedure which in all reason should not he performed without a local anaesthetic.

As the owner of the animal desiring best results, let me suggest to you that you should refuse all professional operators unless they use the local anaesthesia, because the part is as sensitive as the quick of the human finger nail and to perform a good operation the operator must have quietude and freedom from unnecessary struggling. Whatever condition exists, if the hollow sounding portion of the sole is dead, it must be cut away before the new sole will grow.—VET.

Bots in Horses.

Contrary to the prevailing opinion among farmers, the bot which infests the stomach of the horse is often harmful to both young and old animals. By their parasitic tendencies a large number of hots feed on the stomach wall of the horse. They often injure the interior of that organ, prevent proper digestive action, and consequently result in a very thin condition of the animal itself. One of the chief causes of thin horses during the winter is bots, when it is commonly taken for worms or other trouhles.

The botfly reproduces hy depositing ligt, yellow, oval eggs, which are attached by the adult female to the hair of the legs, breast and neck. These may be plainly seen during the summer months on horses that are out of doors. The eggs hatch, and as the horse bites itself some of the small larvae are taken through the mouth into the stomach, where they attach themselves to their lining.

A very effective treatment which will remove bots withing 24 to 48 hours is as follows: The day preceding the treatment a small amount of hay and a moderate amount of oats is given in the morning; in the evening food is withheld and a purgative given—Barbados aloes, 1 ounce; or raw linseed oil, 1 pint. The day of the treatment, at six o'clock in the morning, give 3 deams of carhon hisulphide in a gelatin capsule; at seven o'clock repeat the dose in the same manner; and at eight o'clock give the third and last dose, making in all 9 drams of carhon bisulphide in three gelatin capsules.

The above treatment is for the adult horse. For a yearling colt half the quantity of carbon sulphide used for a mature horse will give the desired results. If properly administered, the gelatin capsules reaches the stomach intact, hut soon dissolves, and the carhon hisulphide rapidly evaporates, suffocating all bot larpae and other parasites with which it comes in contact, but not injuring the horse. Worms are quite often dispelled as well.

A Vicious Practice.

The overstocking of cows has become a fairly common practice at the show and sale rings, but one must search in vain for any valid excuse for the growth and continuance of such an ahsurd and harmful practice. It has heen condemned on a practical as well as a humane grounds and yet there are still exhihitors and sellers who follow the custom, and who, apparently, strive to influence the judge of the prospective purchaser hy means of a trick of the trade. If a cow is overstocked and undue distension of the udder results, the man who is responsible is guilty of cruelty to the animal. Moreover, he resorts to a mean and worthless practice with the obvious intention of, to put it mildly, hluffing someone who may have an interest in the animal, and this notwithstanding the fact that no practical man would be misled hy such subterfuge. The inexperienced buyer might possibly he deceived, but that is no reason why the custom should continue.

Saw Your Neighbors' Wood

IN that way you can make the Renfrew Standard gasoline engine pay for itself. You can readily get from $7.50 to $12.00 per day for your engine and your own services. Your expenses would not exceed $1.50 per day for gasoline and oil. That gives you a net $6.00 to $10.00 profit for a day's sawing. One of our customers made $350.00 in six weeks, and another customer, with a small-sized engine, made $175.00 in thirty days. You can do the same.

Renfrew Standard
It starts without cranking

The Renfrew Standard Portable Sawing Outfit shown above is the handiest, most efficient sawing outfit on the market. Besides being simply unequalled for sawing cord wood, fence posts, poles, etc., it can also be used for any other purpose that a regular portable engine can be used for.

Like all other Renfrew Standard engines it starts without cranking in cold or warm, rainy or snowy, weather. It can be regulated to any desired speed without stopping the engine. Has a governor of the fly-ball steam-engine type, a remarkably simple carburetor, and large bearings. Built throughout of the best materials and with absolute accuracy. No finer engine on the market—and none so simple or so easy to run.

Write for booklet giving complete description.

THE LATE DR. GUSTAVE DE LAVAL

Inventor of the De Layal Cream Separator, the De Laval Steam Turbine and other Machines of Importance.

No doubt this vicious practice of overstocking is due to some extent to the tendency which is ever present in the show yard to produce the abnormal. Exhibitors of pedigree stock frequently complain that animals shown in lean natural condition in the feeding classes have little or no chance when forced to compete with pampered show stock; and in many cases there is a considerable amount of truth in the allegation. The remedy is in the hads of the judges, and one is glad to note that it is occasionally applied; but the fact remains that after several of the leading exhibitions the prize money goes to the animals which are shown in high condition.

The practice of overstocking evidently had its origin in the show and sale rings, but that the custom is not a local one is shown by the comments of an American writer who, in dealing with a recent dairy show in the states, says:—

"The idea behind the "stocking" habit is evident enough. A cow that overstocking did exist it was time that it ceased, and people must find some other means of judging whether a cow was a good milker or not,—a remark which will be endorsed by most agriculturists. As a matter of fact, no farmer with any experience would allow himself to be influenced by the distended udder of a cow. The average dairyman knows too well that overstocking is liable to ruin the cow as a milker, and he looks for other indications of her worth.

Most farmers pride themselves on being able to form a fairly accurate opinion of the milking capacity of a cow from the escutcheon, milk veins, and other points, but after all the only real and satisfactory test is found in the actual yield. The udder should be examined when it is full, but not overstocked, and it is equally important that it shauld be judged when empty. In the show ring, indeed, it would be a distinct gain of cows were sometimes placed in order of merit after they had been "stripped dry." The move, perhaps, would be going to much in the other direction, but it would effectually direct attention to points which at present are passed over. Farmers should ever be on their guard against extremes in fashion and type, and judges at agricultural shows should remember that utility must be the watchword of the best in stock and is not to be sacrificed to mere "fancy" points.

Preventing Erosion.

One of our exchanges, the Southern Planter, points out a very important method of perserving the fertility and keeping the soil in place on the slope, which is not practiced by as many farmers as it should be, which is following the contour of the hill with rows of crops,r unning them on a level around the slope instead of up and down the slope. But the first and proper method, the ridges and furrows tend to hold moisture and to prevent erosion or washing down the hill of the fertile soil. Where the rows are run up and down hill, during heavy rains, the furrows up and down the slope become miniature water courses and the fine rich surface soil is washed to the bottom.

Another means for ckecking erosion says the writer, is deep plowing. Shallow plowing not only prepares but a small area to receive the rainfall, but if persisted in on clay subsoil, it develops a plowed hardpan, which prevents the passage of the water into the subsoil. The change from shallow to deep plowing should be gradual, turning up not more than an inch of raw sub-soil each year. Thousands of acres of Virginia hillside, says this authority, that now wash badly need only to be plowed deep in order to check erosion.

A Prize Winning Box of Poultry Dressed fo Export.

Motor Sleigh Patented.

John Chesney, Melita, Man., has had patented a motor propelled sleigh, and the object of the invention is to provide an easily controlland operated device of this class which can be driven over any roadway on which it is customary for a vehicle to travel, and it consists essentially in a main frame supported forwardly on pivoted runners and a rear-wardly of stationary runners, a set of drums swung from the frame at the rear, drive chains connecting the drum, means for operating the chains, a steering mechanism for controlling the front runner, and a suitable housing or body mounted on the frame.

A New Potato.

It is reported that a new variety of potato is now being grown at Newtonlees Farm, Scotland, which is the result of several year's experiments. The potato is of a beautiful shape, with rough skin of excellent quality, and the yield has been very heavy. One and a half acres were planted, and they have given a yield more than double other varieties planted alongside. One root and fifteen tubers attached to it, thirteen ware and two seed, the total weight being the surprising figure of 10 pounds 12 ounces. As many as twenty-two marketable potatoes have been taken from one root. This new variety is not, however, to be placed on the market for another year.—J. E. Raif, Trade Commissioner, Glascow.

N. S. Fruit Growers Association Jubilee Meeting to Open at Kentville on January 20th.

The Fiftieth Annual Meeting of the Nova Scotia Fruit Growers' Association will be held in the Pastime Hall, Kentville, on January the 20th, 21st and 22nd, 1914.

One first class fare will be issued to all members attending by the D. A. R. and H. & S. W. R. on the standard certificate plan.

The program, subject to necessary changes, will be as follows:

TUESDAY EVENING.

(7.30 O'clock)

Opening Prayer—
President's Address—
S. C. Parker, Berwick, N. S.
Address—Improvement of Home Surroundings,
Prof. Saxby Blair, Kentville, N. S.
Addresses—
Hon. G. H. Murray, Hon. O. T. Daniels, J. W. Margeson, M. P. P., Prin. Cummings and others.

WEDNESDAY MORNING

(9.30 O'clock)

Report of Officers—
Election of Officers—
Election of Delegates to Fourth Dominion Fruit Conference—
Report of Committees—
Resolutions—

WEDNESDAY AFTERNOON

(2 O-clock)

Address—Orchard Diseases, Black Spot, Canker, Fire Blight.
Prof. L. Caezar, Guelph, Ontario.
Discussion—
Local Results fram Spraying during the Last Season—
President Parker, A. C. Starr, F. W. Foster, L. Wiltshire, F. Schafheitlin, W. E. Saunders.

WEDNESDAY EVENING

(7.30 O'clock)

Report o fSpraying Experiments of the N. S. Horticultural Station in 1913—
J. M. Robinson,B. S. A., Kentville, N. S.
Co-operative Marketing—
A. E. Adams, Berwick, N. S.
The Strawberry and its Culture—
W. T. Macoun, Ottawa.

THURSDAY MORNING

(9.30 O'clock)

The Aphis, and How to Control it—
Prof. W- H. Britten, Truro, N. S.
Spraying Mixtures, and How to Apply Them—
Prof. L. Caesar, Guelph, Ont.

THURSDAY AFTERNOON

(2 O'clock)

Some New Varieties of Apples—
W. T. Macoun, Horticulturist, Central Farm, Ottawa.
The Work of the Dominion Department of Etymology in the Valley—
Inspector Geo. E. Saunders, Roundhill, N. S.

MANNING ELLS, Secretary.

The Nebraska Experiment Station finds that a combination of corn and alfalfa hay is one of the most economical and efficient rations for fattening hogs and feeding brood sows. The hay is feed in a self feeding rack, the hogs being the judges of the amount they desired to consume.

Montreal Markets.

BRAN.—The market for millfeed rules strong under a very fair demand from the city and outside points. The enquiry from the American markets shows an increase during the week, but as the supplies in millers' hands are limited, no large orders were booked. Sales of bran to the local and country trade are made on the basis of $20.00 to $21.00 per ton. Shorts and Middlings command fair sales at unchanged prices. We quote prices as follows. Bran $20.00 to $21.00. Shorts $22.00 to $23.00. Middlings $25.00 to $26.00 per ton.

The market for eggs continues exceedingly strong owing to the light stocks held in the market, and the small quantity of receipts coming to hand. Fresh eggs are more plentiful and prices rule easier at 48 cents to 50 cents per dozen.

Finest creamery .... 28c to 28½c
Fine creamery ....27c to 27½c
Seconds .... 25½c to 26½c
Dairy Butter ....22c to 22½c

Potatoes.—The potato market has shown no particular change during the week. Prices of Green Mountains continue easy at 85c per 90 pound bag on track Montreal. Quebec white potatoes are quoted at 80c track Montreal, but the trade prefer to buy Green Mountains at the higher price.

Poultry.—The demand for poultry during the week has been very limited. The better class of turkeys meet with ready sale, but the lighter birds are neglected. Sales of turkeys range between 20c to 21c. Geese are moving slowly at 15c to 16c per pound. There is very little inquiry for ducks at 16c to 17c per pound. Good chickens are worth 18c to 20c and fowls 11c to 13c.

Dressed Hogs.—The market rules firm, but without change, supplies are light, sales being made at $13.75 to $14.00 per 100 pounds for dressed hogs. Live hogs are firmer at $9.50 to $9.75 per hundred pounds for selected lots.

It appears that considerable hay has been bought by country dealers that is still in the hands of farmers, and expected to be delivered as soon as the market improves. There is no doubt that the reduction in the American tariff from $4.00 to $2.00 per ton, caused quite a flurry of speculation in different parts of the interior, as soon as American buyers appeared on the scene and commenced to buy. Prices at country points started a $13.00 to $13.50 and soon reached $14.00 to $14.50, and at some points $15.00 and over was paid. And in fact at one time higher prices were paid in the country than could be realized in this market. Then Americans began to find out they were getting too much Canadian hay for their respective markets, and gradually abandoned their operations on this side of the line. An isolated car here and there being all that is taken for export. Prices rose too rapidly and not a few built their hopes upon values attaining $17.00 to $18.00 at country points.

No. 1 timothy being quoted at $16.00 to $16.50 and fair to good No. 2 at $14.50 to $15.50.

Advices just received from Ontario points state thar considerable hay is being shipped to the United States.—Trade Bulletin, Montreal.

Have you talked with your neighbors about subscribing for Maritime Farmer? Why not do it now? Make up as large a club of subscribers as you can and send them in.

The 1911 census credits New Zealand with 633,733 daity cows; Canada is reported as having 3,000,000 cows.

A COLD Developed Into BRONCHITIS.

However slight a cold you have, you should never neglect it. In all possibility, if you do not treat it in time it will develop into bronchitis, pneumonia, or some other serious throat or lung trouble.

Dr. Wood's Norway Pine Syrup is particularly adapted for all colds, coughs, bronchitis, pneumonia, asthma, whooping cough and all troubles of the throat and lungs. Three points in favour of Dr. Wood's Norway Pine Syrup are: 1. Its action is prompt. 2. It invigorates as well as heals, and soothes the throat and lungs. 3. It is pleasant, harmless and agreeable in taste.

Mrs. Albert Vait, Brockville, Ont., writes:—"Just a line to let you know about Dr. Wood's Norway Pine Syrup. Our oldest little girl is now six years old. When she was four months old she got a cold which developed into Bronchitis, and we tried everything we could think of and had two doctors attending her, but it was no good. One day I read in your almanac about Dr. Wood's Norway Pine Syrup, so I tried it, and before she had finished one bottle of it, the dry hacking cough had nearly all gone. There is nothing equal to it, and we are never without it in the house."

See that you get "Dr. Wood's" when you ask for it, as there are numerous imitations on the market. The genuine is manufactured by The T. Milburn Co., Limited, Toronto, Ont.

Price, 25c.; family size, 50c.

Importance to the Farmer of Growing His Own Seed Grain.

(Continued from page 221)

subsist on scanty rations, can overcome this and grow to the full size of the breed in one generation of good care and full feeding. Neither can the plant. The fact that seed removed from poorer to better conditions gives more satisfactory results than the reverse order is not an argument in favor of the poor conditions but leaves one free to assume that the continuance of the better conditions would favor still greater returns. If this were not true, what becomes of our theory of the adaptability of plants and animals to environment.

Can there ever be a reason for the bringing in of seed? It is possible. One can conceive of a climate or of soil of such a nature that it would not produce a good grade of seed of some certain crop or variety of crop and yet this crop or variety give reasonably good returns from the feeding standpoint. Such cases are rare with us if indeed they exist at all. It is usually a crop of doubtful value from any standpoint which will not give us a good quality of seed.

Wheat produced in the Maritime Provinces does not give as hard a grain as the same varieties grown in the West but is likely to give a relatively high yield. The oat grain weighs heavier per measured bushel than the same variety if produced in Quebec or Ontario. None of the grains transfer the food from the stock to the seed on maturing quite as completely in a moist as in a dry climate or perhaps it would be truer to say the stock continues to take up and manufacture food for a longer period. It is thus evident that the Maritime Provinces have both advantages and disadvantages as a grain producing country but it is also evident that we cannot hope to overcome the disadvantages by going outside for seed except when one wishes to try out some variety not now grown. It also follows that the ahvantages which this country has will not be given a chance to get in their work if we continually go outside for our seed grain. Such procedure does not spell progress but stagnation on our part. I might go on illustrating this point with many examples of seed grain which have not given uniformly good results when first tried that have increased in value year by year. Marquis wheat is said to have given a more satisfactory crop in the Maritime Provinces this past season than it has before. Gold Rain oats recently brought from Sweden, are giving an increasingly good account of themselves to our light sandy soil at Truro. Probably many seed growers here will corroborate these and other experiences from results on their own farms and such discussion is bound to be much more valuable than a continued paper.—Paper read by Professor Landels of the N. S. A. C., at the Maritime Seed Growers' Meeting recently held at Amherst.

Mrs. A. T. Tabor, of Crider, Mo., had been troubled with sick headache for about five years, when she began taking Chamberlain's Tablets. She has taken two bottles of them and they have cured her. Sick headache is caused by a disordered stomach for which these tablets are especially intended. Try them, get well and stay well. Sold by all dealers.

Make your Coal Oil Lamp Burn Gas

The New "Great White Light" Burner Turns Ordinary Kerosine Illumination Into

GASLIGHT

"ASK THE USER"

"Great White Light" Burners speak for themselves, prove their worth, make friends—
IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Light" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosine oil.

THE PROBLEM OF PERFECT COMBUSTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of Oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the Interior of the dome of the "Great White Light" Burner are the marvellous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosine oil. The discovery of the scientific action obtained by the use of the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oll itself, although bofh are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it toward the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oxygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT** - it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely diffenent, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyone, whether new or renewal subscription. When sending in money state which size you want. Send today.

We guarantee these burners to do as represented or money refunded.

The Maritime Farmer

SUSSEX, N. B.

We do not sell these burners but each subscriber may get two besides one we furnish free by sending 35 cents for each additional one wanted.

FLORICULTURE.

Earlton, St.John, writes'—Please state in the Maritime Farmer if Calla Lilies raised from seed during the winter and at present nine inches high will flower in the garden next summer.

I have never grown Callas from seed so I am hardly in a position to state positively what they would do. As a general rule Callas require a period of rest during the summer. If they were mine I would dry them off about June in the pots in which they are grown and keep dry during July, August and September, repotting in fresh soil in October. They should then bloom (if good strong bulbs) in February. Of course a good deal depends on the size and strength of the bulbs. If not extra well developed they might not bloom until the following winter.

H. A., of Hampton, writes to know when Roman Hyacinths should be brought to the light.

They are usually ready by the first of December; we give them six weeks from the day they are potted.

Chinese Lilies do not require the hottest spot you can give them. A moderate temperature will produce a stockier, healthier growth with more blooms.

Don't let the Primrose get dried out now; it is their blooming period and they will take a lot of moisture and nourishment.

If anyone neglects to protect their hardy plants or shrubs, don't give it up and say it is to late. If covered as late as February it is all right. March and April are the worst months of the year for them and protection is most necessary then. Anytuing that is porous and will permit free circulation of air about the shrub is all right, but don't box them up tightly.

To anyone who has young plants of the Boston Ivy on his wall I would advise the cutting off of at least six inches from each tip and branch, if the growth is very sappy cut more. Leave no sappy wood but prune back to sound hard wood, this is a great prevention of winter killing, try it.

Amherst Correspondent:—Bulbs received are undoubtedly offshoots of the Chinese Sacred Lily and should hardly be expected to bloom. Possibly if grown out of doors next summer in the ground they might come to bloom next winter but that is very problematical. Better buy full sized bulbs another time, there is nothing saved by buying cheap stock.

Lakeside, Yarmouth, N. S., writes: Will you kindly give me some information as to the care of a Polystichum Fern, I have a young one that keeps filling the pot with new sprouts. I would like to grow it in one compact root as an old one I had did.

The Polystichum Fern has to be allowed to rest two months during the year by partially drying off. Your plant is ready for this now, as soon as it bigins to shrink usually, in March repot and start watering, then the strong new growth will appear. Old leaves may be removed and the results you desire will be attained. But never allow the plant to become dust dry at any time, just dry enough to drop a little for the two months.

If your children are subject to attacks of croup, watch for the first symptom, hoarseness. Give Chamberlain's Cough Remedy as soon as the child becomes hoarse and the attack may be warded off. For sale by all dealers.

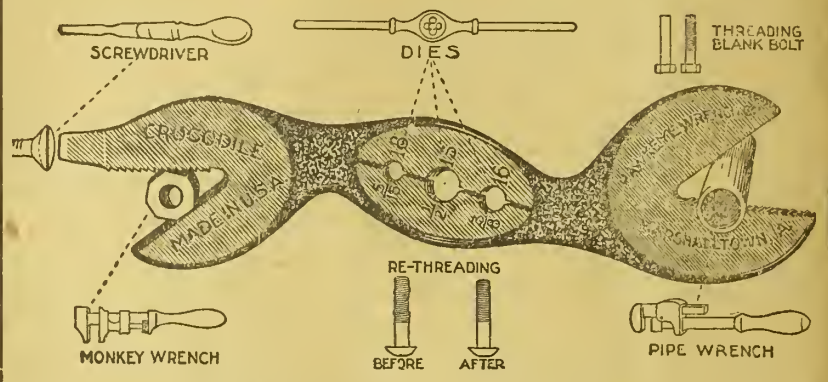
The Crocodile Wrench

An All Around Handy Tool for the Home, Farm and Shop



Six Handy Farm Tools in One

The Crocodile Wrench is drop forged from the finest tool steel and scientifically tempered. Every wrench guaranteed against breakage. It is 8 1-2 inches long and weighs ten ounces.

A pipe wreuch, a nut wrench, a screw driver and three dies 5-16, 3-8 and 1-2 inch for cleaning up and re-threading rusted and battered threads, also for cutting new threads on blank bolts. Dies will fit all bolts used on standard farm machinery.

Teeth and dies are case-hardened in bone-black, making them hard and keen.

The dies on this wrench alone would cost $1.50, and would be worth more than that to every farmer, as they would often save valuable time, besides an extra trip to town for repairs.

How to Procure a Crocodile Wrench

On receipt of $1.00 we will send you the Maritime Farmer for one year and also one of these Crocodile Wrenches. New subscriptions will date from time of recipt, renewals from date of expiration of present subscriptions.

The Maritime Farmer, Sussex, N.B.

The Philosophy of Feeding Dairy Cattle.

BALANCING THE RATION.

By J. H. Grisdale, B. Agr.

The maintenance of life in any animal means food consumption. The performance of work means proportionately so much more food required by the animal body, while the production of milk in large or considerable quantities means much more food consumed even relatively since not only must the elements entering into the composition of the milk be secured from some external source, food, but there is a further and very considerable demand for food to supply the energy required to elaborate milk from the material consumed. In brief, the good dairy cow is necessarily a large consumer of food. Food consumption is her business.

The food consumed should, and usually does, contain the elements found necessary to repair the body waste and elaborate that much-desired product, milk. The animal body consists of (1) water, from 80 to 65 per cent.; (2) ash or mineral matter, from 2 to 4 per cent; (3) fat, from 5 to 30 per cent; and (4) nitrogenous material or protein, from 11 to 20 pes cent. All these materials should be supplied living animals daily in order to keep them in good health.

WHAT WE FEED.

As might be expected, the foods commonly fed cattle and other farm animals contain in varying proportions those very elements found to be necessary to the life and exploitation of the dairy cow. Plants, or their parts, however, contain in considerable quantities a substance called 'carbohydrates' in addition to the protein, water, fat and mineral matters or ash.

Water.—All feed stuffs contain water. The proportion varies from 8 to 1 per cent. in grain, hay, etc., to 90 or even 25 per cent in certain varieties of roots or lush-growing peas and clover. The water in feeds is of no greater food value than common drinking water; but its presence may materially affect the palatability of a food.

Carbohydrates.—Carbohydrates may be said to be of two kinds: Nitrogen-free extract; as starch, sugar, gums, etc., and cellulose or fibre, the principal part of vegetable cell walls. These substances are converted by the animal into fat and so stored in the body and are used at once to produce heat or energy. Carbohydrates, constituting as they do the largest part of most feeding stuffs, are made the basis for ration calculation. Fat, it bas been determined, is worth about 2¼ times as much as carbohydrates pound for pound.

Protein.—Protein (or nitrogenous material) is that constituent of the plant containing nitrogen. It is sometimes called the 'flesh former.' It enters into the composition of most parts of tbe animal body and is a most important constituent of milk. No other substance can take its place. It is believed, however, that protein may take the place of, or can be converted into fat. It is thus evident tbat protein is an indispensable part of every ration.

Fat.—Fat is the part of a feeding stuff that may be dissolved from it by ether. Real fats, moreover, include wax and some other constituents of plants. Fat in the food may be stored in the body as fat, used to maintain the heat of the body or converted into the fat of milk. As already stated, one pound of fat is worth about 2¼ pounds of carbohydrates for heat production.

Asb.—Ash is what is left after the combustable part of a feeding stuff is burned away. It is used in the formation of bone and the elaboration of the digestive juices.

Water is the most common and tbe most important substance in the body. It serves as a solvent for most solids in the body and enters largely into the composition of every part of it as well as plays a most important part in all functions.

Mineral matter enters more or less into the composition of the muscles and otber soft tissues, but is used more largely in building up bone.

Fat is found in greater or less quantities in most tissues while protein enters into the composition of practically every part of the animal body or product. Milk, with the production of which we are especially concerned, has protein for about one-third of its dry matter content, and fat for another third thereof, while sugar, etc., make up the rest.

PROPORTIONS IN WHICH DIFFERENT FOOD CONSTITUENTS SHOULD BE FED TO DAIRY COWS.

A great deal of work has been done by investigators to determine just how much of each of these food constituents is needed by animals under given conditions. It is a general principle than an animal should have as much water as its body calls for, and sufficient asb seems to be fed in ordinary rations to meet all demands. It is evident, therefore, that if it be possible to determine just how much of each of the three remaining classes of nutrients—protein, carbohydrates, and fat—is needed, and if it be known how much of each the various feeding stuffs contain, it will not be a difficult matter to compute the ration.

MEANING OF 'RATION.'

By 'Ration' is meant (1) the total amount of foods of all kinds fed to an animal in each or any 24-hour or day-long period, and (2) in a general way, the mixture of feeds being fed and given herd or individual.

DIGESTIBLE CONSTITUENTS.

By the use of reagents, the chemist can determine the exact percentage of any given substance in a food. Tbe digestive organs of a cow, while able to utilize or digest certain proportions of the different substances, are seldom or never able to dissolve the whole of any food or of any particular constituent, as protein, carbohydrases or fat, contained in that food.

By careful experimental work it has been possible to determine just what percentage of any given substance in a food is digestible by cattle.

The quantity so digestible is called 'digestible protein,' 'digestible fat' or 'digestible carbohydrates,' as tbe case may be.

NUTRITIVE RATIO.

Tbe proportion exiseing between the digestible protein and the sum of the digestible carbohydrates and the fat multiplied by 2¼ in any particular feed or in any mixture of feeds, is known as the nutritive ratio of the feed or of the mixture. Thus in the case of wheat bran there is about 11.9 pounds digestible protein to 47.6 pounds of digestible carbohydrates plus fat x 2¼. If the number 47.6 is divided by 11.9 it will be found to go 4 times. It is then said that the nutritive ration of wheat bran is 1 to 4. This is usually written: N. R. 1:4.

A ration where the amount of carbohydrates and fat is large in proportion to the amount of protein is said to have a 'wide' nutritive ratio. A ration where the proportion was one of protein to 8 of carbohydrates and fat, written usually N. R. 1.8, would be called wide for a dairy cow in milk. 'N. R. 1:8' is read 'Nutritive Ratio 1 to 8.'

A ration with a large amount of protein in proportion to the carbohyd rates and fat, say 1 protein to 3.2 carbobydrates and fat, that is N. R. 1:3.2, would be called a narrow ration for a cow in milk.

A ration in which the proportion between tbe principal constituents, protein on tbe one side and carbohydrates and fat on the other is such that for the amount of feed the best possible results are obtained in the way of milk, in the case of the dairy cow, is said to be a 'balanced ration.' As given in the 'Wolff-Lehmann, Feeding Standard' below a balanced ration for a cow giving about 27.5 lbs. milk should show 1 protein to 4.5 carbonhydrates and fat that is N. R. 1:4.5.

FEEDING STANDARDS.

Investigations made into the amounts of protein, carbohydrates and fats required by animals, and the amounts each available in the various feeding stuffs, have resulted in the evolving of what are commonly called 'Feeding Standards,' indicating what experience and investigation have found to be the approximately proper amounts of each of these essential food constituents to include in a ration for the best results.

Some of the better known of these 'Standards,' so far as dairy cattle are concerned, are given below:—

In using this standard prepared by Professor Haecker at the Minnesota Station, it is necessary to change the amount of food indicated. 'For support of the 1,000 lb. cow' in proportion to the weight of the cow being considered, that is while a 1,000 lb. cow requires 0.700 lbs. crude protein and 7.225 lbs. carbohydrates plus fat x 2.25, a 1,200 lb. cow would requite 1,200 or sixth-fifths of these amounts, or 0.840 lbs. crude protein and 8.670 lbns. carbohydrates plus fat x 2.25.

Wolff-Lehmann Feeding Standard.
(German Investigations)

A glance at the above Feeding Standards indicates the necessity of showing the composition of the feeding stuffs he is using. In the tables on page 116 and following, compiled from various sources, (Henry's Feeds and Feeding in most cases) will be found the quantity of dry matter, digestible protein and digestible carbohydrates, plus fat, (the latter multiplied by the co-efficient 2¼, that is 2.25) in hundred pounds of an average sample of each of the feeding stuffs mentioned. Not infrequently, feeds being fed differ materially in composition from the average as given in the tables just mentioned. This might be due to various causes, as weathering in the case of hay, or drought at filling time in the case of grain.

Among the feeds in the tables as mentioned above, will be found a number that, so far as composition is concerned, come very near fulfilling the requirements of the Feeding Standards. We know that it is impossible, however, witnout serious injury to the health of the cows and to the yield of milk, to feed them exclusively on any one feed, as roots or grain, or even on good corn ensilage alone,and that to ensure good results, these feeds must be mixed in certain more or less definite proportions, such as theory and practical agriculture have together worked out.

A study of the different kinds of foods available is, therefore, necessary so that the proper quantities of the substances in the foods, viz,—proteins, carbohydrates and fats, may be given to the animals and the best results thus attained.

Moreover, it is necessary, both for the sake of economy and for the health of the animal, to weigh for measure the amount of feed given to each. In order that a cow may digest her food to the best advantage she must have considerable volume of bulky food, part of which will necessarily be of low nutritive value. As a matter of fact, her total ration should include from 25 to 35 pounds or even more dry matter. It is evident, therefore, that a great deal of roughage has to be fed so that this quantity of dry matter may be supplied to the cow. Experience has shown that for a 1,000 pound animal a good roughage ration is 35 lbs. corn ensilage, 20 lbs. mangels, 5 lbs. clover hay and a little chaff.

The amount and character of the meal mixture or concentrate part of the ration will be affected by the amount of milk being produced.

If a cow responds freely to an increase of meal she should be fed all the more liberally up to that point where a further increase in the quantity of meal does not seem to produce a relative increase in milk flow.

One pound of meal for four pounds of milk is liberal feeding; one pound for three pounds of milk would be hardly economical unless dairy products were bringing relatively a very high price.

The quantity of composition of the meal ration is an important factor affecting the milk yield. As a rule, heavy milking cows can and will make better use of meal mixtures containing heavy meals such as corn, gluten meal, oil cake and cotton seed meal,, than will small producers.

Further, it is exceedingly important to remember that palatibility in the meal as well as in the roughage is an influence that is not infrequently underestimated. Variety in meals fed is advisable, but variety should mean a blending of meals not a substitution of one for another at frequent intervals. To illustrate, it is much better to feed a mixture of bran, oats, barley, oil meal, gluten, cotton seed meal, etc., than to feed any subsequently replaced by some other.

INDIVIDUALITY OF COWS.

Another point to be kept in mind is that a considerable difference may be observed in individual cows as to their feeding capacity and the returns they make for the food supplied them. These differences may in turn be ascribed to differences in the maintenance requirements of each. The maintenance requirement is the 'amount of food required to prevent the body consuming its own tissues.' In this maintenance requirement, considerable variation may be observed in individuals of the same breeds on similiar feeds and under like conditions. It seems probable that much of this variation is due to differences in the temperament of the animals. Obviously, the maintenance requirement of a quiet, placid animal will be considerably less than that of a restless one.

The individuality of cows, therefore, and especially in the matter of their responsiveness to feed, ought to be a matter of continual study to the dairyman.

HOW TO USE THE TABLES OF COMPOSITION AND THE FEEDING STANDARDS.

To show how to use the tables of feed composition as given on page 117 et seq., in such a way as to learn the probable value of a given ration, or to compound an entirely new ration, the feeds avaijable being known, the following problems and their solutions are given.

Problem I.—'To a thousand-pound cow, yielding 30 pounds of milk a day, there is being fed 35 lbs. corn ensilage, 10 lbs. cut oat straw, 5 lbs. clover hay, 3 lbs. bran and 2 lbs. crushed oats. Could this ration be improved upon, and, if so, how?'

Dicussion.—Reference to the Feeding tables shows the following to be the feeding value of the ration described:—

The following ration, according to any or all of the Feeding Standards given, is evidently much to wide, and

Feed.	Digestible Protein	Digestible Carbohydrates plus digestible fat x 2 1-4.	Nutritive Ratio.
	lbs.	lbs.	
35 lbs. corn ensilage.....	·490	5·530	
10 lbs. oat straw.....	·130	4·130	
5 lbs. clover hay.....	·355	2·095	
3 lbs. wheat bran.....	·357	1·423	
2 lbs. crushed oats.....	·176	1·178	
	1·508	14·361	1:9·55
Requirements of:—			
1. Wolff-Lehmann standard about	3·5	15·2	1:4·50
2. Wisconsin " "	2·11	15·8	
3. Haecker " "	2·00	14·5	
4. Kellner's " "	2·40		
5. Scandinavian " "	2·25		

to correct this condition it will be necessary to either substitute or add some feed rather rich in protein.

The diminution of the straw to 5 lbs. instead of 10, the increasing of the clover hay from 5 up to 10 lbs., the increasing of the bran to 6 lbs. and the addition of 2 lbs. of oil cake meal, would mean a much better ration for such a cow, and a ration that would probably result in a considerable increase in the flow of milk. Below is given the new ration, worked out in the same way as the old:—

Feed.	Digestible Protein	Digestible Carbohydrates plus digestible fat x 2 1-4.	Nutritive Ratio
	lbs.	lbs.	
35 lbs. corn ensllage	·490	5.530	
5 lbs. oat straw	·065	2·065	
10 lbs. clover hay	·710	4·190	
4 lbs. wheat bran	·476	1·901	
2 lbs. crushed oats	.176	1·178	
2 lbs. oil cake	.630	·822	
	2·547	15.689	1:6.2

This modified ration is apparently still to wide according to the Wolff-Lehmann; it is however quite as narrow as necessary according to the other standards given, which are probably the more nearly right. Further, as this ration is made up almost entirely from exceedingly palatable feeds, corn ensilage, clover hay, wheat bran, crushed oats and oil cake meal, is probable that it is as good a ration as could be fed such a cow and almost certainly more profitable than would be a ration complying more nearly with the requirements of the Wolff-Lehmann feeding standard, since to narrow the nutritive ratio dawn to 1: 4.5 would mean the addition of about 3 lbs. more oil cake or else the still further substitution of clover for straw or of clover in the place of part of the ensilage. Our experience here would seem to show that while the Wolff-Lehmann Standards are probably right where no attention is paid to the effect of feeds on palatability, they are apparently unnecessarily narrow when easily digestible, highly palatable feeds make the ration. In this, our experience seems to bear out the findings of the Wisconnsin and other investigators both American and European, whose standards, it will have been observed, are of much wilder nutritive ratio then the Wolff-Lehmann under similiar conditions.

Further, we have seldom found it profitable to feed more than one pound of meal mixture or concentrate to about four pounds of milk produced. Of course, if the cow was giving 30 lbs. of milk on the ration mentioned in the enquiry, she is practically certain to give considerably more, probably 35 to 40 lbs. on the new ration as suggested.

Problem II.—A farmer has at his disposition clover hay, mixed hay, wheat chaff, mangels and oat straw. He has also a small amount of oats and he can conveniently purchase gluten meal, bran and cotton seed meal. He is particularly anxious to produce a large quantity of milk. His cows are for the most part Holstein grades and not long calved. What would be good ration compounded from all or any of these feeds mentioned?

Sloution.—Nothing is said of the quantities of different feeds available hence it will have to be taken for granted that they are any and all, except oats, available in any quantities desired.

The Holstein grade being usually a large cow of 1,200 to 1,500 lbs., a ration must be compiled accordingly. As already indicated, variety is an excellent quality in a ration, so, although a suitable ration might be prepared from which some of the feeds could be left out, it will probably be found advisable to include them all in one proportion or another.

The ration given in the following table suggests itself:

Feed.	Amount	Dry Matter	Digestible Protein	Digestible Carbohydrates plus fat x 2 1-4	Nutritive Ratio.
	lbs.	lbs.	lbs.	lbs.	
Clover hay	8	6·776	0·568	3·352	
Mixed hay	5	4·355	0·295	2·180	
Wheat chaff	5	4·285	0·060	1.335	
Oat straw	8	7·272	0·104	3·304	
Mangels	50	4·550	0·550	2·950	
Oats	2	1·792	0·176	1·178	
Gluten meal	2	1·810	0·594	1·124	
Cotton seed	2	1·860	0·752	0·860	
Bran	5	4·405	0·595	2·380	
		37·105	3·694	18·663	
Wisconsin Standard, about		3·9	3·33		

Since the Wolff-Lehmann Standards do not go above 30 lbs. of milk per diem it will be necessary to compare this with the Wisconsin Standard as given on page 76. The Standard calls for 3.33 lbs. digestible protein, 35.9 lbs. dry matter and 24.3 lbs. digestible dry matter (digestible protein plus digestible fat x 2¼) for a 1,400 pound cow giving from 1.75 to 2.00 lbs. butter fat per diem, which is the maximum such cows might be expected to give when fresh.

The ration as suggested shows 37.105 lbs. dry matter, 3.694 lbs. digestible protein and 18.663 lbs. digestible carbohydrates and fat, approximately the same as in the Wisconsin Standard.

The ration as suggested might be fed as follows:

Morning.—25 lbs. mangels, 5 lbs. mixed hay, 5 lbs., oat straw; and half the meal mixture, since the best way to feed the 2 lbs. each gluten meal, oats and cottonseed meal and the 5 lbs. bran would be as a meal mixture made up in these proportions. Afternoon or evening, 25 lbs. mangels, 8 lbs. clover hay, 5 lbs. wheat chaff and half meal mixture.

It is probable that the wheat chaff would not be all eaten but what was left could be thrown back for litter under the cow.

If more concentrates were necessary, that is, if it were found advisable to give some heavy producing individuals more meal, an extra amount of the meal mixture described would probably be as good as anything that could be fed. Making the proportion of gluten or cotton seed meal 3 instead of 2 would probably be a slight improvement, although any increase of the heavier meals in a mixture must be made gradually and the effects carefully watched.

Nova Scotia Fruit Growers' in Annual Session.

THE OPENING EXERCISES

The fifty-first annual convention of the Nova Scotia Fruit Growers' Association was held in Palestime Hall, Kentville on the 20th, 21st and 22nd inst.

The opening session was on Tuesday evening, when the spacious hall was well filled with the foremost fruit growers of the famine Apple District and not a few others, more or less deeply interested in fruit growing.

Mr. S. C. Parker, President of the Association, occupied the chair, and with him on the platform were the various members of his able executive lieutenants and also Hon. Geo. H. Murray, Premier of the Province; Prof. M. Cumming, J. W. Margeson, M. P. P., for Lunenburg Co.; H. H. Wickwire, M. P. P. for Kings County, and Mr. J. W. Ryan, Mayor of the Town of Kentville.

After the Divine blessing had been invoked by Rev. Mr. Miller, President Parker read the following address:—

THE PRESIDENT'S ADDRESS

Members of the Nova Scotia Fruit Growers' Association, Ladies and Gentlemen:—

We are again gathered in annual session, our fifty-first annual gathering, and it again becomes my pleasant duty to say a few words to you in the way of a report.

The association is yearly growing in numbers and in influence. When a fruit grower is induced to attend one meeting, that person can usually be counted on as a regular supporter. There are men here to-day who have not missed a meeting in many years. Others, younger in years and experience, are coming into the ranks to take the places of those who, from time to time, fall by the wayside. Mr. R. W. Starr, who is with us to-night, has not missed a single annual meeting of the association, since its inception fifty-one years ago.

We are gathered here today to review the successes and failures of the past year, to look into the present situation, and to consider what can be done in the future to place our business on a better basis. The results of the past year have been far from satisfactory. We had our chance and failed to take advantage of it. On the first day of May, 1913, this Valley had a chance to make good. We had a good show of blossoms, with a prospect of, at least, a fair crop of very poor apples. Nineteen hundred and thirteen was a year, when to make good in apples meant a lot of money and much free advertising of our orchards and their products. The markets of the world were open to us—no apple growing section on this continent had a full crop.

The markets were ready to absorb all good fruit available at a good price. We have not made good; and, in my opinion, this failure is the fault of the fruit growers rather than of Providence, upon whom too many of us are inclined to put all blame. I know there are hundreds of fruit growers in this Valley, and doubtless some here today, who will hasten to dispute this statement to the limit. Show me any orchard in the Valley that in the season of 1913 grew a few measly barrels of scabby apples, and I will guarantee to find within five miles of this orchard a farmer who under practically the same conditions with the same environment, had a fair good crop of comparatively clean apples. I will make another assertion that some may rise to dispute. Thorough spraying will not only make apples grow clean, but it will make apples grow where otherwise there would be none. I can give you concrete proof, and much evidence to this end will be offered before the meeting is closed. And, just now, all will concede that there was not a crop of clean apples in any orchard this season that was not sprayed in the most thorough manner.

There is only one salvation for apple growing in this Annapolis Valley, and that is in the gospel of good spraying. We must grow clean apples—nothing else counts. The grower of spotted apples is certain to grow poor, and the more apples he grows the poorer he will become. Scabby apples will not be worth anything in the near future and the man who grows them will not earn his board.

Apples can be kept clean even in the worst season for we have men here to-day who have succeeded in doing so; and what one has done others may do.

The world's crop of apples for the year 1913 was small. Ontario had a small crop, and patchy both in quantity and quality. Ontario, of course, is a large province and the apple areas are widely distributed. Some sections had good quality and others very spotted; New York and New England had an off year. The cop of the Middle West was comparatively light; British Columbia had the most apples she has ever had. The Western States had about half of last year's crop. It is from the Western States that the shadow of over-production looms large. New York and New England had an off year. The crop of better care, and improving rapidly in quantity and quality; but the enormous population in the East will take care of an increasingly large quantity of apples. Ontario this year shipped nearly 400,000 barrels to Western Canada and that growing country will consume any Ontario surplus. If she can hold the market. The four states of Oregon, Montana, Utah and Washington produced in 1911, £18,000 carloads. The year, with an off crop 10,000 car loads.

(Continued on page 257.)

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

FARMING WITH BRAINS.

It was written of a great painter that, in response to the query of a jealous imitator as to what his paints were mixed with to produce such marvelous colors, he replied: "With brains, sir."

Now, when we see two farms alike in acreage, in quality of soil, in the number of stock kept, and in facilities for marketing the crop, one a picture of prosperity, and the other, its near neighbor, perhaps, run down, with poor stand of crops, scrub stock, and delapitated buildings, we are pretty apt to inquire as to the cause of this difference.

The owner of the poorer farm is apt to have a variety of reasons for his non-success, rains, poor seed, scarcity of help, and the all-including term "bad luck." There may be, and doubtless is, much truth in the causes advanced.

But when all allowances are made, and all causes for non-success figured up, may we not in the great majority of cases, with fairness attribute much of the splendid result achieved in the one case to the fact that this farmer like the painter of old did his work with brains.

There is no class of people in this country of a higher average of intelligence to-day than the farmers. No man can produce more from the soil, no man has a better working knowledge of cropping and cultivation than the farmer of this section, but he is far too often contented to get into a rut to fail to take advantage of improved methods, of new and larger opportunities, and above all to study his individual problem, and make the most of the common materials at hand.

In other words he is contented to let "worn out" fields remain worn out, instead of studying their composition and nature with a view to bringing them back to fertility by suitable cultivation.

He is willing to accept the difficulties entailed by the scarcity of labor without seaching for a method of overcoming them by the use of labor saving machinery, and by a systematizing of the work of the farm which makes for the economy in labor.

...

There is no place where brain work counts more than on the farm. The great captain of industry has fewer details with which to burden his mind than the man who cultivates a fairly large farm. To be a successful farmer in these days he must study detail; he must make his own and his hands' labor count to the fullest extent; he must avoid misdirected effort, and must above all realize that in these days hand labor is expensive labor wherever horse power may be employed, and horse power is expensive power wherever the steam or gasoline engine may be made to do the work.

Setting aside the lack of funds, which has been heretofore a serious handicap to most farmers the chief difference between the successful and unsuccesful farmer lies in the fact that the former has awakened to new conditions, and has, to use a homely phrase, learned to let his brain save his hands.

The scarcity of labor is no new problem, It is a condition which has existed in the great grain producing states of the West for a quarter of a century, but the farmers of the Maritime Provinces, adapt themselves to this condition, and are becoming prosperous. The adoption of every improved labor saving device is proving their salvation.

Discouraging market conditions can often be overcome by seizing the opportunity to enter a new market. So called "worn out fields" can be restored by diversified farming, careful study and equally careful cultivation, often assisted by experiments in stock raising.

The farmer of the East is the mental equal of his western brother. He should adopt his methods, study conditions and market reports, keep touch with experiment stations, and become a student of his farm paper. With a soil and a climate that permits the raising of every crop for which there is a market his opportunity is practically unlimited. Brain farming pays.

THE FIRE DRILL ON THE FARM.

Precautions which may aid in saving life and property ought never to be neglected. This is especially true of rural communities, where houses are far apart and fire department practically unknown. Every well-regulated farm should have its hose, ladders and axes and fire extinguishers. But the fire drill is, perhaps, even more important. It has been universally adopted in schools, factories and office buildings. Why not try it with horses and cows in the stable. Animals are only creatures of habit, and we know that they can be trained to do our bidding.

It is common superstition that horses are panic-striken in a fire and will not leave their stalls. But they can be managed, just as frightened children can, by a cool head. The major portion of animals burned to death occurs at night. This is due more to habit than fear. The average horse is rarely taken out after dark. But if he were led into the open in the evening, when he was least expecting it, several times, this habit would be broken. At first they may be slow in responding to nocturnal calls. Let them discover that being led out of the stable after dark means a bit of salt or a lump of sugar, and they will take to the dicipline without the slightest trouble. Of course sometimes it is necessary, in case of fire, to blindfold a horse's eyes and whip him on the forelegs. However, if he is accustomed to being led from his stall after dark he will not be so easily frightened.

There are many little things about the farm that can be done or left undone that will aid materially in saving life and property in case of a conflagration. Boxes, wagon seats, etc., should never be dumped in front of wagons and machinery not in use. Where possible, a hydrant should be installed in the stable, and no smoking permitted among the hands. Rusty locks should be kept oiled and in working order, and floors free from gasoline and other combustibles. Worn-out shingles might be replaced with tin. These are little things but they compensate for their trouble in the long run.

TRUTH SHALL MAKE YOU FREE.

Yes, indeed, over and over again it has been demonstrated that the surest, if not the only, way to escape from the drudgery and slavery of unprofitable dairying is to forsake the old ways of tradition and habit, and accept and follow the new truths which investigation, study, science and experiment have discovered and established. Such are the truths that shall liberate and lift up the depressed dairyman; such the truths that the Maritime Farmer is setting forth from week to week.

We have no occasion to be dissatisfied with the reputation and circulation which have come to the paper. In both respects the results have far surpassed the wildest expectations we have ever indulged, but as the letters come to us, expressing gratitude for what the Maritime Farmer has done for the writers, we do sometimes regret that there are so many people, who could be benefited by reading it, that neglect to become subscribers. It cannot be the matter of mere cost, for there are none who would seriously miss the eighty cents required for a year's subscription.

To meet such cases, we have arranged to send out sample copies of this issue to a considerable number of people whose names have been sent to us by their friends. May we not ask that each recipient will read the paper with care, note the wide field from which its correspondence and inquiries come, the attempts made to give helpful answers, and then candidly consider whether it may not be to his profit, also, to have the paper regularly every week.

"POWDERY SCAB."

In sections of New Brunswick where "Powdery Scab" has been located by the Department of Agricultures' inspectors, they have had no difficulty in tracing the origin of the infection to imported seed. One farmer in a neighborhood unknowingly used infected imported seed in his potato planter. The planter was subsequently used by a half dozen or more of his neighbors and their crops too, although grown from home-grown seed became infested.

There are several morals that may be learned from this experience:

The first is that it is advisable to grow, select and use home grown seed. It proves best under all circumstances, and one is not so apt to get his fields infested with undesirable fungus and insect pests.

The second moral is that in cases where machinery is co-jointly owned by several farmers, that the wise farmer will disinfect said machinery before using. The threshing machine is credited with spreading noxious weeds in cases where the operator is not careful to give the machine a thorough cleaning before moving to the next farm.

That the potato planter may be guilty of a similar offence is proved by the findings af the "Powdery Scab" inspectors. A word to the wise is sufficient.

THE. N. S. A. C. SHORT COURSE.

The 1914 Short Courses at the N. S. A. C. Truro, are now completed. We had the pleasure of spending a day at the college while the Short Courses were in session and it did us good to see the large enthusiastic classes of of young men and young women.

Prince Edward Island holding short courses of her own did not contribute tothis year's Short Courses at Truro and in anticipation of Short Courses being held by the New Brunswick Department of Agriculture the attendance from New Brunswick was rather limited so that it may be said that this year's N. S. A. C. classes were almost entirely Nova Scotian in character.

The programme was all that could be desired. The lecturers and instructors in the different topics were the best available. Interest in the respective lectures was maintained until the end of the Courses and it was with a feeling of reluctance that the various students turned their backs to the institution on the hill to wend their respective ways homeward, where they will put in practice, so far as they can, the precepts gleaned during their courses of study at the college.

BOOK FARMING.

Book farming should begin on every farm with the new year—one acre or one thousand, all need it. Not the "book farming" that the old-fashioned farmer derided, but the book farming that keeps account of income and outgo. A stub pencil liberally used on scrap paper, and an account book may show facts never dreamed of about the finances of the farm. A larger balance at the bank than a year ago doesn't necessarily mean that you've made money.

The first of the year is an excellent time to begin the keeping of accounts. Make an invoice of your belongings; keep account of your receipts, crediting each to its proper source. Record your expenditures and learn later if they were wisely made. Get the figuring habit. Farm bookkeeping doesn't need to be complicated to be effective. Its the only sure way to know what you are really doing with your farm business.

Nova Scotia Fruit Growers' in Annual Session.

(Continued from page 255.)

Next year they expect to produce 25,000 carloads. This tier of Western States is said to have 200,000 acres of orchard just coming into bearing. At 100 barrels per acre, or 300 boxes as they count them there, we are to face 20,000,000 barrels of apples added to the world's production. That is the problem we are facing, and that is the way I say it is useless for us to face that tremendous flood of big red and yellow apples with a few thousand barrels of miserable spotted trash that is scarcely worthy a place in the cider mill. Many of you who keep in touch with the foreign markets, know that two years ago thousands of boxes of Oregon, Newtown's, the highest priced apple in the world, were selling at Liverpool and London at four shillings per box. This is what increased production may mean; and that is the reason this Association is calling on all interested to get busy and grow clean apples, and only clean apples in competition for the world's market.

The next step in the fight for supremacy in the struggle is

GOOD ORGANIZATION IN MARKETING.

The United Fruit Companies have taken a prominent place in the great selling factors of this country. For an organization in the first year of its history to handle nearly one-half of the output of apples of this Province, is certainly a remarkable record- If there had been no Central Organization to manage the output, I am convinced there would have been a far different record, both last year and this. The flood of scabby apples poured on the London market, as without the guiding hand of the Central organization would have been the case, must have resulted disastrously to all fruit interests.

I am convinced that one organization, controlling all the export apples of this Province, is essential to the best interests of all growers. The United Fruit Company may well feel proud of its record and its work, and this Association may certainly be proud of the part it had in effecting the organization.

The British Columbia Government sent their Secretary for Agriculture to the head office at Berwick to inquire into the methods of organizing tion. British Columbia is orgahiz-Co-operative Companies with government capital. The United Fruit Companies has its present standing without government grants or government assistance of any kind. In fact, more than once, the organization has been effected in spite of Legislative indifference, if not active opposition.

Your President was invited by the Ontario Fruit Growers' Assoriation, to visit their annual meeting in November and address them on "Co-operative Marketing in Nova Scotia". I had the honor of giving that Association a brief history of the organization of the United Fruit Companies in the presence of the Minister of Agriculture and Dr. C. C. James, adviser to the Minister, both of whom expressed a great interest in the work being done in this Province. In listening for two or three days to the discussion of the Ontario fruit men, I found their problems much the same as ours. Transporation is a big question with them owing to their long rail haul and enormous output of soft fruit. Their troubles cause ours to shrink into insignificance. They have a permanent transportation committee with a paid secretary. This committee is kept busy in looking after matters in this connection.

Second, only, to the importance of growing clean apples is the importance of standing close by the Co-operative organizations; the next five years means five years of struggle to maintain our ground. We have many advantages that none of our competitors can ever have. The fittest, only will survive and it is up to us to make good.

In the death of Alexander McNeill, for many years Chief of the Federal Fruit Division, this Association and the great fruit interests of Canada have lost a tried and proved friend. Mr. McNeill was a familiar figure in these meetings. He came to us many times at much personal sacrifice. He was always ready to assist when needed; to speak the cheering word and work for the advancement of the fruit interests of Canada. Personally, and I am sure I speak for every member, we deplore the death of our late chief and feel the loss of a friend and co-worker, who was always ready to work for the advancement of a true Christian nationality. At another time in this Convention, it will be in order to place on our records resolutions, expressing our appreciation of the life and work of our departed friend.

While the Fruit Division is without a head seems an opportune time to press on the Government the growing importance of the fruit interests, and to urge the Minister of Agriculture to establish Horticulture as an independent Department under a Commissioner, rather than remaining subsidary to some other department. This matter has been brought to the attention of the Government in the past, and a resolution along these lines may also be in order.

The Experimental Fruit Station is showing rapid development and never was more needed than now. By undertaking a series of experiments in spraying, cultivation and fertilization in different sections of the Valley, Professor Blair is making an effort to solve some of the troubles that are ever present with us. From per sonal observation, I am convinced that the work carried on, even in this first season, is of great value to the fruit growers. We will be given a summary of this work at this meeting.

It seems very fitting that this session should be held in this central town of Kentville. We have plenty of material here for a splendid meeting, and I am sure all will combine in making it a grand success.

THE JOINT ADDRESS OF WELCOME.

of the citizens and Board of Trade of Kentville was read by His Worship Mayor Ryan, who among other things made reference to the prominent part the fruit growers had taken in getting the Experimental Fruit Station established near his town and to the possibility of holding a large, successful show at Kentville in the fall of 1914. He advocated that a Short Course in apple packing be conducted in Kentville at a date in the near future.

THE REPLY TO THE ADDRESS OF WELCOME

was fittingly made by Mr. W. H. Woodworth, of Berwick, who expressed strong sentiments in favor of the Short Courses in Apple Packing referred to in the Address of Welcome.

THE MUSICAL PROGRAMME

consisted of the following well rendered numbers:

Piano Duet—By Mrs. B. U. Parker and Miss Ida Randf

Vocal Solos—By Herbert Oyler.

Vocal Duet—By Mrs. F. B. Newcombe and Mr. A. H. Morash.

Vocal Duet—By Mrs. Arthur Tully.

Quartette—By Mrs. Newcombe, Mrs. Tully, Rev. T. C. Mellor and Mr. Morash.

HON. G. H. MURRAY

delivered an interesting, non-partisan address on "The Most Serious Problem Confronting Public Men of Nova Scotia—Money."

He outlined the resources from which Nova Scotia derives her revenue—Federal Subsidy, Royalty Duties and Succession Duties. The avenues for expenditure were many, the most important ones were :—Education, Roads and Bridges, and Humane Institutions. At a recent conference of Provincial Premiers, from each province of the Dominion; the unaminous concensus of opinion was that the Federal grants to the respective provinces should be increreased. Premier Murray also spoke of the need for cheaper money for the farmer. This and other social problems require the early attention of our public men. The foundations for a greater Nova Scotia had been well laid. The Agricultural College, The Technical College and the managing principles of the Humane Institutions were along right lines.

There were three avenues whereby cheaper money could be procured for the farmer.

1. Direct loans by the Government. 2. Loans by a Financial Institution, whose bonds would be guaranteed by the Government. 3. Co-operation among the farmers themselves. Avenue number two was in his opinion the most feasable way.

Nova Scotia has the best apples, fish, coal and steel and to keep her in the fore-front he asked his audience to think wisely and well on public questions, particularly those affecting their own province.

J. W. MARGESON, M. P. P.

for Lunenburg Co., spoke on the value of organization and co-operation. He strongly advocated more vocational training for our farm boys and girls. He expressed the views that the very best immigration work that is necessary in Nova Scotia is wrapped up in keeping our own farm boys and girls at home. To accomplish this it was necessary to make the home life on the farm as sweet to the young people as it should be. Five of our own industrious good young citizens were of more value to our country than five hundred undesirable immigrants. He set up a plea for more faith in our own country and the necessity of letting the world know of that faith by singing the praises of our heritages whereever and whenever the opportunity offered.

PROF. M. CUMMING

was present and outlined the work that is being done to advance agriculture in Nova Scotia. The Short Courses recently held in Truro had been a record-breaker in the annals of Canadian Agricultural College Short Courses.

He referred to the serious fungus and insect pests with which the fruit growers had to contend. A new Entomologist in the person of Prof. Britain had been recently appointed, and the work of fighting these pests would not lag. He submitted to the fruit growers for their consideration at a future meeting the advisability of also appointing a specialist on plant diseases.

Mr. H. H. Wickwire, M. P. P., for Kings County was present and in the closing remarks referred to the fine agricultural possibilities of his constituency.

THE WEDNESDAY MORNING SESSION.

was devoted to the transaction of routine business.

Secretary Ells read the following report which was adopted:—

SECRETARY'S REPORT

Our Association marked time in 1913 to the extent that no special meetings were held as in the previous year.

Apple trees started their leaves very early, and showed an abundant bloom, but until the blooms fell we had an almost constant succession of cold rainy days, and as a consequence fertilization was very imperfect, and a poor set resulted.

In almost every case where orchards were sprayed twice before the blossoms opened, and the work followed up afterwards, a good crop of clean apples resulted. In almost every case where no spraying was done before the blossoms opened the crop was a total failure.

We have on our program this afternoon the names of ten fruit growers, men living in all parts of the Valley, whose experience along this lin! I think will interest you, and as the discussion of this subject comes up later, I will not refer to it any further here.

The apple crop was a little more than half of that grown in 1912, and about one-third of the record-breaking one of 1911. In addition to this the quality was very poor, and a large proportion have to be marketed as No. 3's. It is humilitating to note year after year in English market reports Nova Scotia apples quoted from two to six shillings below those from New York, Maine and Ontario. Surely the difference in the size of the barrel is not responsible for all this difference in price.

That it pays to pack and market No. 3 in a year of crop failure such as this is probably true, but with new orchards coming into bearing, and a great increase in production expected within the next ten years in all apple growing parts of America, the question of whether we shall continue to produce No. '3 or not, becomes a vital one to the prosperity of this Valley.

In almost every community we find a few men who are following the instruction of the experts of our Agricultural Colleges, and Experiment Stations. These men by thinning spraying, etc. even in a year of bad climate conditions such as has just past, are getting a proportion of No. 1 fruit so far above the average that an onlooker from other walks of life cannot understand why more do not follow their example.

Believing this question of better fruit is one of the most important we have to deal with, we have arranged a program for this meeting dealing especially with the control of fungus diseases and other orchard pests. The address given by Prof. Wallace at one of our meetings some years ago at Windsor has been worth thousands of dollars to our fruit growers. The information by Dr. Stewart last year at Middleton on the use of commercial fertilizers, was timely and valuable in enabling us to purchase them more intelligently. We have Prof. Caesar with us today, and believe that with the knowledge he has for us, we will be able to handle this problem of better fruit to greater advantage.

THE TREASURER'S REPORT.

Last year's balance was $253.31 and receipts during the year had been $557.40. The expenditures had been $778.71 leaving a cash balance of $32.00.

THE ELECTION OF OFFICERS.

resulted as follows:—

President—F. W. Bishop, Paradise.

Vice President—A. E. McMahon, Aylesford.

County Vice President for:—

Annapolis Co.—G. C. Miller, Middleton.

(Continued on page 264)

LIVE STOCK.

Preparing of Animals for Slaughter.

Animals intended for slaughter should be kept off feed from twenty-four to thirty-six hours, if kept on full food, the system is gorged and the blood, loaded with assimilated nutrients, is driven to the extremities of the capillaries. In such a condition it is impossible to drain out the veins thoroughly when the animal is bled, and a reddish-colored, unattractive carcass will be the result. The blood is the most easily decayed substance in the animal carcass, and often causes trouble in the curing of meat. Food in the stomach decomposes very rapidly after slaughter, and, if the dressing is slow, the gases generated often flavor the meat.

Water should be given freely up to the time of slaughter, as it keeps the temperature normal and helps to wash the effete matter out of the system, resulting in a nicely-colored carcass.

It is important that the animals be not excited in any way sufficiently to raise the temperature of body previous to killing. Excitement prevents proper drainage of the blood-vessels; and, if extreme, will cause souring of the meat very soon after dressing. In no instance should an animal be killed immediately after a long drive or after a rapid run in the pasture. The flesh from animals overheated is usually pale in color, and often develops a sour or putrid odor within three or four days after being dressed The animals should not be chased or driven rapidly, nor should they be handled in such a way as to bruise the bodies. Bruises cause blood to stay in that portion of the body affected and often cause the loss of a considerable portion of the carcass. A thirty-six hour fast, plenty of water, careful handling, and rest before slaughter, are all important in securing meat in the best condition for use, either fresh or for curing purposes.

Animals with fine bones and soft, luxuriant hair, are more likely to yield a good quality of meat than those with coarse bones and wiry hair.

An animal should never be losing in flesh at the time of slaughter. If failing, the muscle-fibres are shrinking in form and contain small amounts of water. As a consequence, the meat is tough and dry. When the animal is gaining in flesh, the opposite condition obtains and better quality of meat results. A better meat-product will be obtained from an animal in only medium flesh, but gaining rapidly, than from an animal that is very fat but is not gaining in flesh.—Andrew Boss, University Farm

The Foot and Mouth Disease May Spread.

In discussing the question of how the disease of foot-and-mouth may be spread from one country to another and from one farm or district to another, we other, we pointed out last week that the dribbling of saliva from the mouths and discharges from the vesicles on the feet of infected animals in and about the farm buildings and on fodder, etc., are very easily recognized causes of infection. In addition to these, however, there are other causes of infection which are perhaps not so well recognized, from their having a foreign source probably, and there is an interesting chapter on this subject in Mr. G. Sutherland Thomson's book on "British and Colonial Dairying," reviewed lately. Not to mention the traffic in foreign hides, eggs, etc., which is capable of being cootrolled so as to afford some protection to British stockowners, there is a prolific source of infection which is connected with the importation of foreign grains and foodstuffs to this country from abroad. One serious danger is that connected with the importation of maize from the east of Europe, where the cereal is cultivated to an enormous extent by small cultivators and is by the village populations, who bring to the maize fields during the season their families and entire live stock, comprising draught cattle, pigs and poultry. These are details connected with the harvesting of maize which make it an easy vehicle for the carriage of foot-and-mouth disease.

The infection of grain by vermin—e. g., field rats, mice and birds—which are numerous in maize fields and in granaries, points to another source of infection, and there is the probability that wind and dust storms and migratory birds may play a part in the transmission of the disease. Hares, foxes and even dogs also have been mentioned, and there is not a biped or a quadruped in existence which may not be, in certain circumstances, the innocent cause of an outbreak of this very infections and costly disease. It is suggested that a strong agricultural committee should be formed in England to confer with leading agricultural associations on the Continent, with the object of minimising the spread of the disease from one country to another.

Weighing Sheep.

Thete appears nothing like going about a bit among brother farmers in different counties to pick up wrinkles. In South Devon lately I was looking over some strong lambs. Something was said about the weight of them, and to my surprise there was an animal—a lamb or sheep, which ever it might be called—put on its back in a trice in a clothes basket which was on a common weighing-machine, and the weight taken in the time it takes to write it. The animal was as quickly returned to the flock. There need, however, have been in no hurry, for, to my astonishment, the animal never struggled in the basket. Several more were weighed in the same way, and the farmer said he so weighed his whole flock before sending it to market, and then he knew how to go on there. This somewhat primitive plan might suit anyone who wished to take the weight of lambs or light sheep. Of course, the weight of basket must be allowed for. I think a clothes basket will answer better than a box for the purpose. It is about the right size. As regards live and dead weight, it varies considerably, according to the breed of animal, its state of fatness, and whether fasted or not. I once weighed a cross-bred lamb—a Leicester-Shropshire— after fasted twelve hours. It was between three and four monthd old. Live weight was 70 lb., dead and dressed 40 lbs. The lamb was, as might be supposed, nice meat—ready for butcher. Big South Devons would not give quite so good a return dead according to live weight. An old South Devon ewe, moderately fed, would, I should say, slide off a bit more than half in weight in the killing and dressing when fasted for 12 hours. An eleven month old Devon lamb in fair condition would waste nearly half, I daresay. But many circumstances and conditions have to be reckoned in calculating what certain live animals would weigh dead.—Farm and Home, England.

The Future Meat Supply.

For weeks prior to the removal of the American tariff on cattle, speculators were busy gathering live stock in Canada and then, for some weeks after, quite a formidable procession crossed the border. This gathering process has resembled a clean-up, but it is exremely improbable that either Ontario or Quebec can supply the same number to American markets a year hence. In some districts nearly everything has been shipped away except dairy cows.

Another cause of the beef shortage is the vealing of so many calves, few more being kept than are really necessary to replenish the dairy herds. The beef industry in Canada should not be allowed to dwindle to the production of veal only. The heifers should be kept for the purpose of producing more calves, to utilize the rough feed on the farm and to make manure to maintain soil fertility. Vealing heifer calves, while it may give the farmer a quick return is destroying good beef making material and is too much like killing the goose that lays the golden eggs.—F. C. N.

Help Keep Cattle Clean.

At least twice a year the working cows in the dairy herd should have their hind quarters and udders clipped smooth. In the spring this is an aid to the natural shedding. In the fall or early winter it makes the job of keeping the cows clean during the winter much less arduous. If the clipping is delayed until after cold weather starts a warm week should be picked for it, for then there will be less chance of the cattle becoming chilled. A machine clipper requiring two men, one turning and the other operating the cutter, is relativey inexpensive and will cover a good many animals in a short time.

Fits in Pigs.

Fits in pigs are usually only of two kinds, apoplectic or epileptic.

APOLEPTIC FITS.

These are comparatively rare, but apoplexy is due to many causes, the principal of which are: Exposure to the sun's rays, over feeding, rupture of an artery, causing compression of the brain, blows on the head, growth of a tumour, fright, clots in the cerebral arteries, an accident placing the animal for a time in a position mechanically preventing the return of blood from the brain, venous congestion, and, in fact, any cause obstructing the functional activity of the brain.

SYMPTOMS.

The attack is sudden, the animal is unconscious, breathing loud, laboured, and slow, the tongue protruding and blackish, and there is partial paralysis with occasional twitches, from time to time, generally on one side of the body, the eyelids are closed, and the pupils frequently dilated and insenitive to light.

TREATMENT.

This combines removal to a dark quiet and cool place, cold applications and douches to the head; mustard or white oils rubbed in the back of neck, spine and extremities, and, if consciousness returns, administer four grains of calomel and twenty grains of jalap, or any domestic pill of any aperient character, doubling the human dose. The powder, or the crushed pill can be made into an electuary or paste with a little jam, and smeared on the tongue with the handle of a spoon, or mixed with two tablespoonfuls of milk, or, as the animal is not likely to struggle (being somewaht dazed), one or two ounces of castor oil may be given warmed. To administer these, elevate the head, make a pouch by pulling the cheek from the teeth, and slowly pour in without troubling to separate the teeth. The dose will then be slowly and easily swallowed. Or one may administer two ounces of Epsom salts, dissolved in five ounces of ale.

THE AFTER TREATMENT DEMANDS.

Isolation, quietude, darkness, laxative food, and once daily in water or food the following:— Iodine of potassium, five grains; nitrate of potash, thirty grains; for about a week. This line of treatment in many cases will prevent recurring attacks, and will remove many of the possible after effects.

WILL THE ANIMAL PAY FOR TREATMENT.

That depends on the value of the pig, the condition of the animal, fat or otherwise, the possibility of paralysis ensuing, whether the animal is barren or pregnant, and whether she was for a short or long time unconscious. All these factors must be considered, and perhaps the owner may determine to have the creature slaughtered at the earliest opportunity before any treatment is adopted. The flesh may usually be sold for human consumption, as, strictly speaking, it is not a disease, but in many cases due to an internal mechanical cause.

EPILEPTIC FITS.

These occur amongst all animals, but man, dog and pig are more frequently victims than equines or bovines or ovine, probably because of their larger and more complex brains, and higher mental developments.

GENERAL REMARKS.

This disease has peculiarly attracted the attention of mankind from the earliest periods; our most ancient literature containing scattered illusions to it. The suddenness of the attack, the unconsciousness, the struggling, the equally rapid return to normal condition have invested this discase with a mystery and a

You Can Cure CONSTIPATION By The Use Of MILBURN'S LAXA-LIVER PILLS.

A free motion of the bowels daily should be the rule of every one, for if the bowels do not move daily constipation is sure to follow and bring in its train many other troubles when the bowels become clogged up. You get Headaches, Jaundice, Piles, Heartburn, Floating Specks before the Eyes, Catarrh of the Stomach, and those tired weary feelings which follow the wrong action of the liver.

Mrs. Elijah A. Ayer, Fawcett Hill, N.B., writes:—"I was troubled with constipation for many years, and about three years ago my husband wanted me to try Milburn's Laxa-Liver Pills as they had cured him. I got a vial, and took them, and by the time I had taken three vials I was cured. I always keep them on hand, and when I need a mild laxative I take one."

Milburn's Laxa-Liver Pills are 25c. a vial, 5 vials for $1.00, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

Here is a remedy that will cure cure your cold. Why waste time and money experimenting when you can get a preparation that has won a world-wide reputation by its cures of this disease and can always be depended upon? It is known everywhere as Chamberlain's Cough Remedy, and is a medicine of real merit. For sale by all dealers.

LIVE STOCK.

halo of superstition, so that the early Greeks spoke of it as the "sacred disease," and the treatment of it was considered to belong more to the priest than the physician. This continued even to the middle ages, and from the similiarity of symptoms in man and swine during the attack, it was believed to be transmissable from one to the other. The miracle of the man, possessed by devils (epilepsy) being freed therefrom and sent to occupy the bodies of swine, reflects the general idea of that time. At the present time we must confess, in spite of all the researches that have been made, we are still in ignorance of the essential cause of epilepsy. Consequently no really rational treatment had neen introduced. Hereditary tendencies are assumed, and that is true, but rhe answer still hides our ignorance. At any rate, do not knowingly breed from any animal known to have fits. Other assumed causes are (1) an undiscovered anto-toxin, specially acting on the nerves, issuing from the base of the brain or front of spinal cord. (2) A tuberculosis deposit in or on the brain, or some of the intermediate forms of trematode worms taking up their position there, and by their growth setting up pressure or irritation. (3) A reflex irritation produced by intestinal parasites, especially the small round worms. (4) Dentition: Previous to the eruption of the first or second teeth, the pressure of the jaw and gums sets up inflammation, and this communicated to the dental branches of the great nerve of the face, sympathetically excites a nerve storm. The fit itself is not the disease; only a culmination of unknown previous causes. (5) Indigestion: This is also a probable cause, and perhaps more frequently than any others. Fits may occur in suckling piglings, when the sow has been improperly fed.

SYMPTOMS.

The most constant feature is the sudden onset of absolute unconsciousness, the victim neither hears, feels nor sees, nor can be roused by any means at our command. The head is drawn on one side, and generally the patient falls on its side, and the frame is agitated with violent convulsions. The teeth are clenched, the tongue is often bitten, and the urine or faeces are passed involuntarily. There are remissions but often after a few moments the symptoms are renewed with violence. After a varying period of time they lessen in violence, consciousness returns, and the animal will resume the occupation it was engaged in prior to the fit, but usually it seeks quietude and darkness and sleep to restore the energy expended. There is for at least twenty-four hours a tendency to a recurrence of the fit. Many cases are far milder and of shorter duration. In feeding or playing, a young pig may suddenly stand still, or turn round in half circles, look dazed, stagger, and then quickly recover, the whole process not occupying more than five minutes.

TREATMENT.

During the attack nothing can be done except, possibly, removal from the vicinity of any hard body against which the animal might be bruised during the convu sive movements of the body. After recovery, a saline purgative should be given, in which thirty or forty grains of bromide of potassium have been added. The rest is a laxative diet, isolation, and quiet. If there is dentition trouble, search and distract supernumerary or crowded teeth. If the animal is effect tic fits, nothing has yielded so good ed with worms, give a vermifuge; if a result as the administration, twice in poor condition, better feeding and daily, of from ten to fifteen grains tonics. If piglings are attacked dur. (depending on size) of bromide of ing lactation with sow, feed her care- potassium, continued for at least a fully, give castor oil, and let her fortnight or three weeks. As it is have a run twice daily for a short rare to find any pathological changes time, weather permitting with her in the brain or other organs, the pigs. Of the medicine known, tend- animal may be slaughtered, and its ing to prevent a recurrence of epilep- flesh consumed safely.—Vet.

If You've Building to Do This FREE Book is for YOU!

Perhaps you are planning to build a new barn or house—or repair an old one. Don't decide what materials you'll use until you have received and read this book about "Metallic" building materials. Maybe you think you don't want a "Metallic" made building. Send for the book anyway. You may change your mind when you discover that the best buildings for your farm—fire-proof, lightning-proof, decay-proof—buildings that once built will last forever—may cost no more than you're planning to spend.

Describes all kinds of "Metallic" materials and articles needed for your house and barn, including the famous

"EASTLAKE" METALLIC SHINGLES
Corrugated Iron for Roofing and Siding
Metallic Siding
Halitus Ventilators
Weather Vanes
Eave Trough and Conductor Pipe
Acheson Barn Roof Lights

WRITE FOR IT NOW!

Get the facts—figure on the cost—make sure that you can get a better building at no greater cost—then decide. If you could get more for your money by reading this book you would quickly send for it, wouldn't you? Then write right away—tell us what building you're planning to do. Ask for book R 2.

DAIRYING.

Something About Milk Veins and the Udder.

A few years ago we thought we would see what percentage of the farmers believed that the large veins on the belly of the cow, which are called milk veins were really veins for conveying milk to the udder. So without expressing any opinion of own on the matter we simply asked the following question of one farmer after another: "Why are those veins called milk veins?" The answer from 90 out of the one hundred was in effect, like this: "Because they carry the milk to the udder." Of the remaining ten, five could not give any answer except to say that they did not know, while only five had the right idea, viz: that these veins are in reality great blood veins returning blood from the udder to the heart.

If we believe the truth as it really exists, that these veins return the blood to the heart it will teach us several valuable lessons:

1. It will show us the enormous circulation of blood that is required to produce milk in a good cow.

2. It will teach us that we must take good care of the udder, for with such a heavy inflow and outflow of blood, the organ is vry sensitive to abrupt changes of heat and cold. This is the reason that cows are very apt to have garget by lying on cold ground late in the fall. Also by lying on stone or cement floors.

3. It will teach us the folly of tying cows in the common stanchions whereby it is easy for a standing cow to step over onto the teats or udder of the cow that is lying down next her.

4. A knowledge of the true physiology of the udder will teach us the importance of careful and gentle usage of it in milking and the great importance of attending to any derangements at once.

We wish also to speak of the importance of the knowledge of the above facts to every farmer and dairyman in selecting a dairy cow.

Milk approaches the blood so closely in function and vitality, that it is in fact almost a part of the blood itself.

The milk glands and the blood system are so closely associated and a large milk yield is so absolutely depepdent upon a heavy blood supply that large milk veins in connection with a good big udder cgn be taken as proof that a cow is a first class milker.

Influencing the Richness of Milk.

Dr. Harold B. Wood states that the conditions which affect the richness of milk in butterfat are; "(1) Breed and individuality of cows;(2) Time during milking; (3) Manner of milking; (4) Length of time between milkings; (5) Period of lactation, care and feed of cow; (6) Environment."

Either of these conditions would make a rext for a much longer preachment than the doctor gives to them in an able article contributed to the Country Gentlemen. It would be an excellent thing if some of our best equipped experiment stations would take these six points for a thorough course of research and there by give us some conclusions based on a scientific attelbpt to know what are the laws that most fully govern them. There is another matter that most urgently needs patient investigation and that is whether there is anything in the construction of the udder as seen externally, that would fairly indicate whether the cow yields milk rich or deficient in butterfat. Several theories are floating about on this question based on the limited observation of individuals. For instance, a gentleman of large experience was in our herd the other day and stated that so far as he had been able to correlate facts, he believed that those cows which were of a more solid color, approaching a deep red, gave, as a rule, richer milk than those of a lighter shade, especially if much mixed with white. We are not aware that any attempt has been made to collect and classify facts bearing on this point other than in the case mentioned. There is a large domain yet unexplored concerning the dairy cow.

Will not some of the more enterprising breeders, in all breeds of dairy cattle, attempt something of this kind? Take any one of the points enumerated by Dr. Wood and subject it to a course of observation for the next twelve months and see what the conclusion is.—Hoard's Dairyman.

Dairy Strippings.

Did you know there is such a thing as drying a cow all up by being in too big a hurry when you milk her? It is so. Take your time to be gentle, tender and manly, even about milking a cow.

Have a name for every cow and call them by that name.

A man told me how careful he was about straining his milk the other day. He used so many thicknesses of good heavy cloth and all that; but he never said a word about the pains he took to keep the stuff out so that a strainer would not be needed. The fact is, you never can strain impurity out of milk. Set that down in big letters. You must keep it out, or it never will be out.

Some farmers have a way of keeping their cows in the barn all the time, summer and winter. That is no way to have good, healthy cows. Let them out! They need air and exercise as much as you and I do. It is little short of cruelty to animals to house a cow up the year round. And it brings disease to the folks that use the milk sometimes, in the bargain.

Get your milk out of the barn just as soon as you can after it is in the pail. There will always be some odor, do the best you can.

If your milk must stand a little while before it is strained or separated, put it into covered pails, so that no dust or other particles of matters from the air can get to it. The best way, though, is to take it away as soon as you can.

Mark it down for a fact that it is the cow you are kindest to that will do the best for you, everything else being equal.

Milk early those long days.

I have heard an old soldier tell what terrible stuff they had to drink in the line of water sometimes. My! It was awful. But the fact is, none of us like to drink bad water. The cows do not either. They will not do it, unless they are absolutely compelled to do it. There are few farms in this country on which a good supply of nice pure water may not be had by working for it. We ought to be ashamed of ourselves if we do not do it, too. Get good water or go out of the dairy business.

Some women are natural born butter makers. If your wife is one of that sort, praise her up. It will do her good and the butter will be a little better still. I will guarantee it.

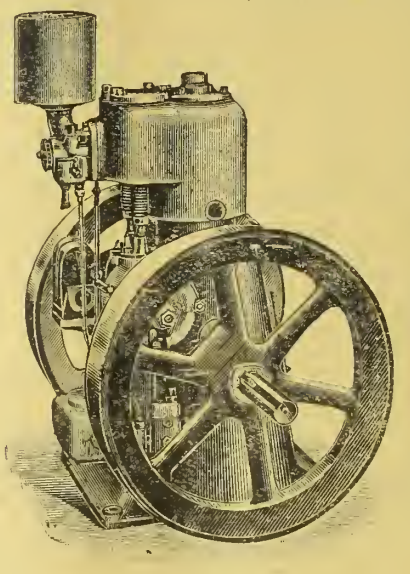
Now, don't bring up your girls in ignorance of the way to make good butter. Let that be a part of their education, You are not fair to them if you do not.

It is a good plan for the man of the house to know how to step out and churn and take care of a mess of

DON'T take our word only, but examine the Lister Engine at work alongside any other, compare its quality, efficiency, economy—In a word, let the engine speak for itself and you will become another delighted user of

THE LISTER
GASOLINE ENGINE

(British Made Throughout)



The most reliable, best quality and value.

Starts instantly — every time, with Bosch Magneto ignition—no batteries to run down and give trouble.

Self-oiling, no oil cups to fill—no oil to waste.

Self-regulating at all loads. No attention needed when at work.

Fitted with phosphor-bronze bearings throughout, the best money can buy.

No babbit metal to wear and run out.

In a word, the best quality engine ever seen in Canada

We have sold over 50,000 Melotte Cream Separators in Canada during 15 years. Ask any Canadian user how he likes the Melotte.

Well—**we guarantee** the Lister as good an engine as the Melotte is a cream separator. We can't say more.

butter. Ther? may be times when the wife cannot do it.

Most brindle cows are good ones; but don't stop and say, "I'll have all brindle cows or I will have none.-' It never. pays to bite your own nose off to spite your face. Doesn't look well either.

Our little shaver has a sheep he calls "Smiley." He imagines she is always smiling at him. Maybe that is because he always smiles when he sees her. Be gentle with your cows and they will look so much nicer to you.

Let's get over the notion that we can strain impurty out of milk. The milk strainer never was made that will do that. The only way to make milk pure is to keep it pure.

Don't fling the salt into a mess of butter by guess. Know how much butter you have and then measure or weigh out the salt accordingly.—E. L. Vincent.

Variations in the Fat Content in Milk.

As scientific knowledge becomes more generally distributed many facts that a few years ago were but little known are being given general recognition. One of these facts is that there is a very remarkable difference in the richness of different samples of milk. Numerous investigators have set forth the results of their own research work in regard to this matter. The results of investigations have, of course, been somewhat different. We have in the past published the conclusions reached by some persons; we now give below a statement recently made public by Mr. Fred Rasmussen, dairyman at the New Hampshire Experiment station. He says:—

Different conditions will cause a variation in per cent. of fat in cows' milk. In the early part of the lactation period, when the cow is giving a large quantity of milk, the test is lower than the latter part of the lactation period when the milk flow is decreasing. The variation may range from a half up to three per cent., depending on the breed and the individuality of the cow.

The percentage of fat may also be influenced by the time between milkings. In an experiment where cows were milked at six o'clock in the morning and three in the afternoon, the average test in the afternoon was 4.6 per cent., while in the morning it was 2.8 per cent. When the same cows were milked at 5.30 a. m. and 5 p. m. the fat content of the evening milk was 3.8 per cent. and af the morning milk 3.18 per cent

The first milk drawn from the cow is much thinner than the last. Investigations by de Vriezes show the following results: In the first streams ½ per cent. fat; after drwaing about ¼ the quantity of milk 2.1 per cent. fat; after drwaing ½ the quantity of milk 2.1 per cent. fat; after drawing about ¾ of the milk 5.2 per cent fat; in the last milk 7.1 per cent., and in the very last drop of milk drawn 10 per cent fat.

The relations between the nervous system of the cow and her powers of milk secretion is so intimate that any changes and abnormal conditions the cow experiences will have a direct influence on the quantity and quality of the milk.

Changes of food, of the time of feeding and drinking, restlessness in stable, changes in weather, etc., will tend to vary the quality and quantity of milk secreted. A cow tested by the writer under normal conditions gave milk testing about four per cent. Once, while in heat, she tested 12 per cent.

INTERNATIONAL STOCK FOOD
The Greatest Animal Tonic In The World

And the greatest feed saver in the world. This wonderful tonic will keep stock in better condition with 25% less feed, than regular feed without it.

This is because International Stock Food enables Horses, Cows, Pigs and Sheep to get all the nutriment out of their feed.

It aids digestion and assimilation—keeps the blood clean and the flesh firm—and protects the animals against disease.

THREE FEEDS FOR ONE CENT

If you will write and tell us how many head of stock you own, we will forward to you free our $3,000. Stock Book. 100

INTERNATIONAL STOCK FOOD CO. LIMITED, - TORONTO.

Make Your Stock and Poultry Pay Better with

Royal Purple

STOCK AND POULTRY SPECIFICS

At a cost of less than a cent a day per head of stock, it will increase their value 25 per cent. Permanently cures Colic, Debility, Worms, Bots and Skin Diseases. Tones up run-down animals so that they quickly gain weight and vigor. Increases the yield of milch cows three to five pounds a day, besides enriching the quality of the milk.

ROYAL PURPLE is not a food. It is a conditioner—the best ever so'd. If there was any better we would be making it. It enables your stock to eat the natural food they should eat and get the most benefit from it. Here is the advice of all thorough veterinary doctors—"Feed your stock on food of your own growing"—not pamper them with soft predigested mush so tbat after a time they cannot digest good, wholesome feed. Feed the good food grown on your own farm—hay, oats, bran, chop, etc. You know what these things cost you and what they will do.

ROYAL PURPLE is an aid to these natural foods and if you use it as directed, we can guarantee better results than if you feed any of the concoctions offered on the market as "prepared foods."

Try It On a Poor-Conditioned Animal

If there is a run-down, poorly nourished beast on your farm, see what ROYAL PURPLE SPECIFIC will do for it. A 50-cent package lasts a cow or horse 70 days. The cost is so trifling that no farmer in Canada has any excuse for having out-of-health stock around his place. Try it on the poorest-conditioned animal you have and we know you'll be surprised at the result of a short treatment. Cattle and hogs fatten up a month earlier than without it, which means you save a month's feed and a month's labor. You can bring six pigs to the pink of condition at the cost of $1.50. Steers treated in the same way cost no more than $1.00 each to put in prime state for market. ROYAL PURPLE SPECIFIC fattens and keeps well horses, mares, colts, cows, calves, steers, hogs. Sold in packages, 50c, and air-tight tins, $1.50.

Try ROYAL PURPLE POULTRY SPECIFIC on Your Hens

Do you know that ROYAL PURPLE POULTRY SPECIFIC makes hens lay in winter as well as in summer, and keeps them free from disease? It does, and helps them over the moult, fattens and keeps them in vigorous health. A 50c package lasts 25 hens over 70 days. Shouldn't you try it? We have hundreds of recommendations from all parts of the country. If ROYAL PURPLE does not give you better results than anything you ever used, or give you satisfaction, we will refund your money. No matter what your opinion of other preparations, we want you to give ROYAL PURPLE POULTRY SPECIFIC a chance to show what it can do for your poultry—and a 50c package will show you some fine results. Sold in 25c and 50c packages and $1.50 air-tight tins.

WE ALSO SELL

Royal Purple Cough Specific for cough and distemper. (Will cure any ordinary cough in four days). 50c, by mail 60c.

Royal Purple Sweat Liniment for lameness, rheumatism, sprained tendons, etc. 50c, by mail 60c.

Royal Purple Worm Specific for animals; removes the worms, also their larvae. 25c, by mail 30c.

Royal Purple Disinfectant, in 25c, 50c and $1.00 tins.

Royal Purple Lice Killer for poultry and animals. 25c and 50c, by mail 30c and 60c.

Royal Purple Gall Cure for scratches, harness scalds, open sores, etc. 25c and 50c, by mail 30c and 60c.

Royal Purple Roup Specific for roup, pip, diphtheria, typhoid fever, canker, white diarrhoea, swelled head, etc., in poultry. 25c, by mail 30c.

Free

TO STOCK AND POULTRY RAISERS

We will mail for the asking our new revised 80-page book on common ailments of stock and poultry. Tells how to feed light and heavy horses, colts, mares, cows, calves, steers, hogs; also how to feed and keep poultry so that they lay winter and summer. Cover lithographed in six colors, showing farm utility birds in their natural colors. This is a book that should be in every farmer's possession. IT'S FREE. Write for your copy today.

POULTRY.

The Candling of Eggs.

As regards quality, an egg is one of the most difficult of food products to grade. Its external appearance gives but little indication as to its fitness for food and the contents cannot be sampled without destroying the fragile shell.

Fortunately an egg is semi-transparent when held before a light and permits, if carefully rotated, of even minor defects being seen. It is not necessary to use an extremely powerful light. An ordinary kerosene lamp, a gas jet, or a 16 candle power incandescent bulb are the sources of light most generally used in commercial work.

From time to time various appliances have been invented to facilitate the candling of eggs in quantities. These have proven serviceable for the simple detection of bad eggs, but have not been found satisfactory for the purpose of fine grading.

It is necessary therefore in commercial work as well as in private practice for each and every egg to be passed separately and with a quick turning movement before the light. in the large wholesale produce houses where large quantities of eggs are handled it is remarkable how expert some candlers become. They pick up rIgularly from two to three eggs in each hand and depending upon the season candle from 25 to 35 thirty-dozen cases per day.

The size of the air cell, the consistency of the albumen, the color and mobility of the yolk and the general transparency of the whole egg are the factors most generally recognized as determining the quality.

The contents of an egg, just laid, completely fill the shell, but as cooling takes place contraction occurs and an air space about the size of a five cent piece is formed. The yolk is only slightly perceptibly and should swing readily in the albumeo when the egg is turned around.

A stale or shrunken egg may be detected by the size of the air cell. The shell is porous and evaporation takes place whenever the egg is surrounded by a temperature above freezing point. Even in the low temperature of a cold storage house a certain amount of evaporation occurs. The higher the temperature and the more rapid the air circulation the greater is the evaporation. Accompanying the evaporation a staleness of flavor soon develops, and if the egg is held in the presence of moisture or packed in dirty fillers it is apt to become musty. As the egg grows staler the albumen tends to lose its consistency and often becomes quite watery. The yolk may also break down and in extreme cases mix with the albumen.

A bad egg or an egg which has been incubated may be readily detected fram the fact that the clear transparent part has become dark and opaque. Many other forms and degrees of decomposition occur, but the above are those most commonly seen.

Many simple devices and appliances have been devised for the candling of eggs. Probably the simplest method is to place the egg between the thumb and the first finger and hold it between the eye and the light, using the free hand to shut off as much of the surrounding light as possible. A better method is to hold the egg at the end of a long paper or metal tube. Another simple means is to take a piece of cardboard or folded sheet of newspaper, cut a hole in it about an inch in diameter before which the egg should be passed with a gentle turning motion, between the eye and the light.

Perhaps the most serviceable of home-made appliances may be constructed from an ordinary tin biscuit box which can be used in conjunction with a kerosene lamp or an electric bulb. The polished tin surface reflects the light and increases greatly the efficiency of the apparatus. A hole one and one-eighth inches in diameter should be cut in one side of the box, three and a half inches from the bottom. To obtain the best results this hole should be faced with thick paper or felt. When a lamp is used it is necessary to cut an additional hole in the bottom large enough to admit the burner and another in the lid through which the chimney may project.

It is possible for anyone with a little patience to tell at a glance the main points of difference between good and bad eggs. Any one of the forms of candling apparatus suggested above, or others equally as good, may be purchased at a small cost. Neither the small cost of the apparatus nor the amount of labor entailed in candling, presents any valid r eason why the public should be obliged to use or accept bad or incubated eggs. Storekeepers will find it to their advantage to acquire facility in candling and it is recommended that every housewife should provide herself with a simple candling appliance by the diligent use of which she may safeguard her family from any unpleasant occurrences at the breakfast table.—Zamphlet No. 3 by W. A. Brown, Live Stock Dept., Ottawa.

Three Guesses on Egg Market.

The price of eggs in early December advanced to unprecedented heights. Immediately many of the wise ones decided they knew just what was the matter with the market. Many city consumers declared for a boycott on eggs, believing they could bring the prices down to a lower level. Others sought refuge in a federal investigation into the high price of eggs, seek ing to throw the blame upon refrigerating concerns. Not being successful in any of these attempts they finally blamed the hen. The last guess comes closest to being right.

Of course eggs in storage at present are not as many as a year ago, but since early in the fall receipts at local markets the country have been small; thus the shipments to the large distributing centers were curtailed. The result was a gradual advance in the price. Even storage stock sold at wholesale at New York up to 31 cents per dozen and in Chicago at 27 to 28 cents. Strictly fresh eggs reached 80 cents at retail in some cities. Mid December found prices slightly lower, although there was still a big scarcity of eggs, Chicago quoting first at 32 cents and storage stock at 26 to 27 cents wholesale. At New York hennery eggs sold up to about 45 cents.

Exercise of Laying Hens.

To have your hens do their very best laying they must have plenty of exercise. The lazy, inactive hen puts on too much fat, and is usually a very poor layer. A mash wet down with skim milk may be fed early in the morning. A limited amount must be given, since, if the hen is allowed to become gorged early in the day, she will have no incentive to get out and forage.

Watering Rack for Hens.

The winter water of hens presents difficulties when the flock consists of over 100. The practice of placing drinking dishes on the floor is insanitary. A serviceable and efficient rack was built by making a frame 2 feet, nine inches wide by 5 feet long and from 3-inch stuff. A bottom was added and braces were nailed from the floor to the sides of the frame.

The frame, 2 feet from the floor, will not be too high for the heavier breeds to reach. A 9-inch piece was then nailed across the top of the frame, next to the wall.

A slat rack which fits on top of the frame is made 2 feet wide and 5 feet long from slats $\frac{3}{8}$ inch wide and $\frac{3}{4}$ inch high, nailed edgewise on a frame made from 2-inch stuff. Place slats $1\frac{1}{2}$ inches apart. Shelves are placed 7 inches above the rack on which the fountains rest. A rack of this size will accommodate 10 to 12 fowls at a time.—M. L. Cady, New Jersey.

Mate the Breeding Pen Early.

I mate up my breeding pens in January or Febuary, putting from 10 to 15 females with a male, or if I have a pen of 25 females, I mate them with two males, placing them with the hens alternately. In the morning they are fed liberally of wheat, oats, buckwheat and barley scattered in a deep litter of cut straw, which gives them plenty of exercise, which is very important to promote the health of fowls and to produce strong chicks.

At noon they are fed a mash consisting of wheat bran, hominy, gluten dairy feed and a little oil meal, mixed to a crumbly mass, or fed dry, in which case it is kept before them in hoppers all the time. To this mash is added a little salt and about three times a week a little cayenne pepper. Sometimes boiled vegetables are added to the mash, thus giving a variety.

After dinner they are fed their green food, which consists of cabbages, beets, clover, alfalfa hay, corn silage, or anything that I may have on hand in the vegetable line. At the same time they are given their green bone, about an ounce a day to each

Had Salt Rheum.

Could Scarcely Do Work.

Skin diseases are invariably due to bad or impoverished blood, and while not usually attended with fatal results are nevertheless very distressing to the average person.

Among the most prevalent are: Salt Rheum, Eczema, Tetter, Rash, Boils, Pimples, and Itching Skin Eruptions.

Burdock Blood Bitters drives out all the humor from the blood, and makes it pure and rich.

Mrs Ellwood Nesbitt, Apsley, Ont., writes:—"I had Salt Rheum so bad I could scarcely do my work. I took two treatments of doctor's medicine, but they did me no good. A friend told me his wife had had Salt Rheum, and that Burdock Blood Bitters had cured her, so I got a bottle, and before I had it all taken my hand was better."

Burdock Blood Bitters is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

fowl. When I do not have green bone a good beef scrap is given in the mash.

At 4 o'clock they are fed whole and cracked corn mixed, about all they will eat up clean. Grit, oyster shells charcoal and fresh water is kept before them at all times. By following this method feeding and caring for fowls during the breeding season I have always secured fertile eggs that hatch strong, healthy chicks.

Getting Ready for Spring Trade.

January 1st marks the beginning of the poultryman's preparations for the spring trade. If he is running incubators and brooders, he mates up his breeding pens and makes arrangements for early hatching. With quite a number the incubators are started some time during January, and those early birds are quickly grown into broilers.

The wise poultry man saves only from his March, April and May hatches for future breeding stock, turning everything else into table poultry.

Now is a good time to purchase new blood, for by waiting until spring opens there is a possibility of having poor stock to select from. The choicest go with the early orders.

All poultry houses should be so constructed that there is ample room in them for the fowls to exercise and keep busy during such weather as compels them to remain indoors. For this purpose there is no better plan for a house than the one constructed on the scratching shed order. These not only provide comfortable quarters but they admit such large quantities of fresh air, and yet shield the stock from the inclemency of the weather, that instead of suffering from the confinement they seem to profit by it.

"Getting ready," too, means extra care with the breeding stock. At this writing we are near the first of the year. It means considerable bad weather yet to come. We never feel safe until the "short but decisive" month of February has left us. Then we naturally look for "better days." Knowing that the birds must be more or less confined for a month or two longer, the practical man secures a lot of straw or hay, and this he uses freely in the houses, scattering grain among it, compelling the hens to work hard to secure their meals. This exercising promotes health, it keeps the stock happy and it produces eggs. It requires health and contentment in a hen to make eggs. They are ingredients as important as is lime for the formation of the shell.

Another factor is proper feeding. A man who overfeeds does more harm than good to his stock. Proper conditions means well fed and well cared for. A hen in good laying condition rarely, if ever, overfattens. It is the idle, "lazy crittur" that takes on layers after layers of fat. An overfat hen is not a healthy one.

On all the well-conducted poultry plants trap nests are used. These nests at this time of the year perform an important mission in picking out the January and early February layers. As the pullet goes on the nest she becomes trapped and when released, if she laid, a ring is placed on her leg. Each ring has a separate number. On some the large farms pullets that have not begun laying during January are at once discarded winter egg producers are of more worth than hens that wait until the warm suns of spring appear. There is only one way of finding out which is the cream of the flock and that is through the aid of a trap nest.

If each year the breeding is done only with the winter workers, it is reasonable to suppose that annually the stock will become more valuable for that purpose. The writer has trap nests installed in all his pens. These he starts on November 1st and keeps them going until June. For the following five months the traps are converted into open nests, no individual record being kept of the summer laying. What we want to know is which of our stock give us the most eggs during the season of the year when the prices are the highest. At the end af each year we pick out our best layers and breed only from such. Each year we sell off half of the previous year's breeders—of course, retaining the cream—and make up the other half with pullets hatched in the spring. We hold over during the month of January more pullets than we need, so that the pens will be made up of birds that are laying that month.

The breeding pen should now be arranged. We do not favor large flocks. Better results are always obtained from small families well managed. Our pens contain fourteen hens each, and for strong fertility we alternate male birds in the pens. This can be done in many ways. Some favor changing males in each pen once a week, others prefer twice a week, and still other daily. The idea of alternating is that it does not give either the males or females a chance to have favorites. It is a fact that male birds continually in a flock are very apt to pick out certain hens as their companions, and will ignore all others in the flock. On the other hand, females are apt to form a dislike for a certain male and will refuse his attentions. It is needless to say this will be the cause of a large number of infertile eggs. Now, by changing the males, those hens being previously neglected will at once take up with the new males, and, he being a stranger to the flock will be glad to at once form their acquaintance.

These are matters very important to the farmer who wants to get the best results from his flocks and we would like to impress upon him that he should be careful in selecting males, as the cock bird is fully two-thirds of the value of the family and he counted for or against the future his merits and demerits are sure to generation. It is economy to buy good blood, even though the price seems a little high.

130-Egg Incubator and Brooder Both For $13.90

If ordered together we send both machines for only $13.90 and we pay all freight and duty charges to any R. R. station in Canada. We have branch warehouses in Winnipeg, Man. and Toronto, Ont. Orders shipped from nearest warehouse to your R. R. station. Hot water, double walls, dead-air space between, double glass doors, copper tanks and boilers, self-regulating, Nursery under egg tray. Especially adapted to Canadian climate. Incubator and Brooder shipped complete with thermometers, lamps, egg testers—ready to use when you get them. Five year guarantee—30 days trial. Incubators finished in natural colors showing the high grade California Redwood lumber used—not painted to cover inferior material. If you will compare our machines with others, we feel sure of your order. Don't buy until you do this—you'll save money—it pays to investigate before you buy. Remember our price of $13.90 is for **both** Incubator and Brooder and covers freight and duty charges. Send for FREE catalog today, or send in your order and save time.

100 p. c. Increase in Crops

The French Minister of Agriculture says that farms in Europe have doubled their productiveness in 100 years, and that 70 p. c. of this is due to the use of commercial fertilizers.

Such an increase could be obtained only by using good fertilizers. "Made at Windsor Fertilizer" is not only good fertilizer, but the best fertilizer.

It is manufactured at

WINDSOR, NOVA SCOTIA

in the largest—best equipped—and most up-to-date Fertilizer Factory in Canada.

When you buy your fertilizer ask "Is this Fertilizer made at Windsor, Nova Scotia?" If the man says "Yes", you are getting the best.—If he says "No", you are not.

Write us and we will give you the name of the nearest "Made at Windsor, Nova Scotia" Fertilizer Agent.

BOX 432 - - WINDSOR. N. S.

START THE NEW YEAR WELL

by improving matters in the Kitchen—that Keynote of the Home.

A kitchen well equipped for systematic work means better results in the preparation of meals, hence less friction in the home and a happier outlook for the year.

THE ENTERPRISE MONARCH STEEL RANGE

{FOR WOOD / FOR COAL

with latest improvements, will ensure meals on time with less labor, worry and fuel, than is possible with most other ranges which do not possess s the advantages of the MONARCH.

These advantages are many. They are explained clearly and briefly in our illustrated booklet which will be sent you on request.

If you are out this year for money and time saving, it will pay you to investigate the merits of the MONARCH, the range with the Guarantee.

Value of Blood for Production.

In 1906, the West Virginia Experiment Station made a series of experiments that tell a tale worth remembering : Fifty White Leghorns were compared with 50 mongrels for one, as to cost of food and egg production, ardinary c[illegible]d attention beiog given them, such as they would dition to skim-milk used to moisten receive on the average farm. In addthe mash, the Leghorns consumed 61 pounds of food, [illegible] 4.3 cents and the mongrels consumed 66.8 pounds of the same materials, costing 92.1 cents. During the year the Leghorns averaged 116.5 eggs, worth $2.24 per hen and the mongrels 96.1 eggs, worth $1.78 per hen. The Leghorns gave a profit over the cost of food of $1.39 per head and the mongrels a profit of 86 cents. The Leghorns gained in weight one pound per head more than the mongrels. The highest prices for frsh eggs usually prevail during the months of November, December, January and February. During these four months the mongrels laid only 364 eggs and the Leghorns 1,020 or practically three iimes as many.

Publication committee:—F. W. Bishop, M. K. Ells, S. C. Parker.

Delegates to fourth Dominion Fruit Conference:—S. B. Chute, M. K. Ells, A. E. McMahon, W. W. Pineo, S. C. Parker.

Substitutes:—A. S. Banks, W. H. Woodworth, F. H. Johnson, F. W. Foster, John Donaldson.

F. W. Foster one of the Commissioners of the Provincial Exhibition, reported the difficulty of getting a creditable showing of fruit at so early a date as that on which the exhibition is usually held at Halifax. He recommended that the exhibition appropriative for the fruit department be not reduced but that fewer varieties and only those that show to good advantage, at the time of exhibition, be included in the list and that for these varieties more substantial prizes be offered. After some discussion a resolution, in accord with Mr. Foster's suggestions was passed. Several of the speakers to this resolution thought anything that tended to a weak showing of fruit should be dispersed with and efforts concentrated on holding an outstanding fruit show at a later date.

To assist Mr. Foster in making a selection of the varieties that should be included in the Halifax Exhibition prize list, the following committee was appointed:—Prof. W. S. Blair, A. C. Starr, Wm. O'Brien, Fred H. Johnson, and W. A. Hebb.

In regard to the 1914 Kentville Exhibition, Prof. Blair thought it advisable in following the lead of some of the large U. S. Fruit Shows in preparing the prize lists.

Prof. M. Cumming said that when the fruit growers of Nova Scotia decided to hold a Provincial Show devoted exclusively to exhibits of fruits it would be advisable to hold it in a consuming rather than in a producing locality.

Messrs. W. W. Hubbard, W. W. Baird and J. A. Clark of the three Maritime Experimental Farms were present and had words of cheer to offer re the progress that is being made in their respective provinces. A telegram conveying the greetings of the New Brunswick Fruit Growers' Association was read, enthusiastically received and a reciprocal message was exchanged.

ON WEDNESDAY AFTERNOON

Prof. L. Caesar, of the O. A. C., Guelph, Ont., gave one of the most instructive addresses ever delivered before a meeting of Nova Scotia Growers. He captivated his audience at the very start and the tense attention paid to every word he spoke showed that the fruit growers were at Kentville to receive all the information they could get on the question of combatting such orchard diseases as Black Spot, Canker, and Fire Blight, etc. The unanimous concensus of opinion was that the address was most timely and to the point. That Prof. Caesar had made a study of conditions in the Valley and governed his address accordingly was testified to by the expressions of practical experiences related by several of the prominent fruit growers who had practised methods as outlined by Prof. Caesar who had been successful in obtaining a high percentage of clean fruit in 1913, during the worst scab season ever experienced in the Valley. We will publish Prof. Caesar address in full in a later issue and we feel confident that it will benefit the delegates who were present from Kentville as well as the large army of fruit growers in all parts of the Maritime Canada who were not present, to read and digest its contents.

A Real Lever Simulation

GOLD WATCH FREE.

A straightforward generous offer from an established firm. We are giving away Watches to thousands of people all over the world as a huge advertisement. Now is your chance to obtain one. **Write now**, enclosing 25 cents for one of our fashionable Ladies' Long Guards, or Gents' Albertx, sent carriage paid to wear with the watch, which will be given Free (these watches are guaranteed five years), should you take advantage of our marvellous offer. We expect you to tell your friends about us and show them the beautiful watch. Don't think this offer too good to be true, but send **25 cents** to-day and gain a Free Watch. You will be amazed.—WILLIAMS & LLOYD, Wholesale Jewellers (Dept. 69), 89, Cornwallis Road, London, N., England.

CO-OPERATION

was the theme of a masterful paper by Mr. Adams, of the United Fruit Companies, Berwick, at Wednesday evening's session. We are very much mistaken if the broad views expressed by Mr. Adams re co-operation and the benefits derived therefrom did not make many friends for the movement at that meeting. We hope in a future issue to make extracts from Mr. Adams' address for the benefit of our readers.

Mr. Moore, Chief of the Markets Division, Ottawa, was present. He gave a description of the manner in which fruit sales are conducted in the various European marts.. One of the greatest necessities at the present time was cold storage facilities in the respective fruit houses so that the temperature of fruit could be lowered and kept low until the apples were placed on the market in sound condition. He exposed the view that there was little prospect to acquire fame in apple growing for any country producing too great a percentage of No. 3 apples.

STRAWBERRY CULTURE

Prof. Maconn, Dominion Horticulturist gave a talk on Strawberry Culture which lead to an interesting discussion, despite the lateness of the hour. Extracts from these discussions will appear later in these columns.

THE APHIS AND HOW TO CONTROL IT.

was the subject of a most instructive address by Prof. W. H. Britain, the newly appointed Entomologist for Nova Scotia. His masterful delivery, his thorough grasp of his subject and the readiness with which he replied to the questions that came thick and fast made an impression on the fruit growers that bide well for the co-operation he will receive in carrying on his work. It is generally conceded that Prof. Britain's father, the late Dr. Britain, has done more for the advancement of science in reference to plant life, in the Maritime Provinces than any other man and we have no hesitancy in predicting for our young friend, Prof. Britain, a most successful career in assisting the fruit growers of Nova Scotia in combatting their insect enemies.

Prof. Britain paid a high tribute to the good work that has been done in exterminating the San Jose scale in the Valley, by Mr. Geo. Saunders and his lieutenants. His talk on the "Aphis" will be published later.

SPRAY MIXTURES AND HOW TO APPLY THEM

was the theme of an address on Thursday by Prof. L. Caesar. The address was full of good things and we will be pleased to make full use of it in a future issue. Prof. L. Caesar was largely impressed with the business-like manner of the Valley fruit growers and the deep interest they took in the vital questions that affected their business. He predicted that there would be something radically wrong if, with such able leadership as the fruit growers now possess, they do not make the world sit up and take notice of their rapid advancement in matters horticultural during the course of the next decade.

J. M. Robinson, B. S. A., Assistant Horticulturist at the Kentville Experimental Station, outlined the results secured by the spraying experiments conducted at Berwick and Falmouth under the direction of the Station during the season of 1913. Extracts from this address will be published later. Mr. Robinson having been born and brought up in the Valley is thoroughly acquainted with local conditions and is thus able to do good work in assisting his fellow fruit growers.

"THE WORK OF THE DOMINION DEPARTMENT OF ENTOMOLOGY IN THE VALLEY

was outlined by Inspector Geo. E. Saunders, Round Hill. Mr. Saunders was the first man who discovered San Jose Scale in Nova Scotia and he has been first and foremost in the fight for its extermination, which has been so ably accomplished. The report showed that everything possible for human means to accomplish is being done by Federal and Local Governments to control the insect pests found in the Valley.

Following are the resolutions passed by the Fruit Growers:—

—RESOLUTIONS—

It is with sincere sorrow that we are called upon to chronicle the death of Alexander McNeil, Chief of the Fruit Division. A man whose qualities of mind and heart gave him the reputation of im-

CLEAN STABLES PAY BEST

This photo shows the BT Galvanized Steel Stalls as they are being furnished for thousands of dairy barns in every part of Canada, east and west.

Calf-pens, cow-pens, bull-pens, too are made of galvanized steel.

Note how the Galvanized Steel Supporting Columns improve the appearance of the stable. This Galvanizing WITHOUT INCREASING THE PRICE, is an exclusive feature of BT Equipment.

A stable like this lasts a century. It won't even burn. And it's ten times easier to install than wood. The BT Galvanized Steel Stalls come ready to set up, from the factory. A man and boy can put up 20 of them in 2 hours, without expert help. There are just three large bolts to tighten up on each stall, and the job is ready for the cement.

A prominent Canadian Dairyman has often remarked: "A clean, well-ventilated stable, with cement floors and walls, and equipped with Steel Stalls and Stanchions, pays best for any farmer, whether he is fattening stock or is going in for milkers, whether he has three cows or three hundred."

"For," he said, "a sanitary, steel-and-cement stable WILL PAY FOR ITSELF in a few years, but a wood-fitted stable, with wood stalls, NEVER WILL."

Cattle grow up stronger and healthier, in a steel-and-cement stable, because they are protected from disease, from the day they are born. There's not a single rotten, manure-soaked board to harbor germs. Deadly Tubercular germs die when they come in contact with the steel of the stalls. There are no dark corners for them to lurk in, because the open construction of the steel stalls lets the bright sunlight bathe every inch of the stable. Sunlight kills germs.

Cows are healthier. They give more milk and better milk. You get better prices for your stock and for your dairy products—you have fewer veterinary bills to pay. That's the certain result of putting BT Steel Stalls in your barn.

Labor is lessened in keeping the stable clean, for the surface of the stalls is smooth, and there are no cracks to catch the dirt.

BT GALVANIZED STABLE EQUIPMENT

Your stable always looks as good as new when you put in BT Stall Equipment, because every Cow Stall, every Bull-Pen, Calf-Pen, Cow-Pen, every Water Bowl and Steel Supporting column is galvanized. The galvanizing material enters right into the pores of the metal, so the stalls are not affected by moisture.

Insist on having BT Galvanized Stable Eqipment in your barn, for it costs no more than painted stalls and it lasts twice as long.

Investigate all the facts about BT Equipment for yourself. There are many other advantages that mean a saving of money, time and labour in your barn.

Learn how the Aligning Device on BT Galvanized Stalls keeps the cattle-stand clean, the bedding clean, and prevents flanks and udders of the cows being soiled. Every long and short cow is lined up even with the gutter, so the manure falls right into the gutter. It is no longer necesary to scrub down the cows before milking

Read about the famous BT Swivel Cow Stanchion, that gives the cow as much comfort as when out in pasture, that can be opened and shut in a jiffy with the thumb and first finger. Stall Book No 21 tells all. Sent free if you'll fill out and mail the coupon.

FREE

BARN PLAN SERVICE

A barn wrongly planned will lose money for you every day. The wrong design of framing inconvenient arrangement of feed bins and feed rooms, the wrong location of posts, a silo in the wrong place, a poor arrangement of stalls, mistakes in sizes of cattle-stands. gutters or passages —all these mistakes are costly.

But all these items are right in a barn planned by experts who know dairy barn needs down to the smallest detail.

If you intend building or remodelling, avoid all the mistakes of poor and carelessly made plans. Accept the advantage of proper barn-planning, and

Let Beatty Bros. Help You Plan Your Barn This Winter

We've had a Barn-plan Department in connection with our business for many years, and have planned the most successful dairy barns in Canada. We invite you to write us about any ideas you have for the layout of your barn, amount of stock you will keep, etc. and get our advice and criticism, without charge. We'll make pencil plans for you incorporating improvments we can suggest.

Send For Free Book No. 21

BT Galvanized Steel Stalls have proved a profitable investment for farmers and Dairymen everywhere in Canada, and we believe they will be equally profitable for you. Learn the facts for yourself. Get our book and prices NOW and figure it out when you have more time than you will have later in the season. Our big, illustrated Stall Book shows many fine views of modern barn, with the Stall equipment in actual use and is brim full of interesting information.

Your barn will be a permanent investment. Once the stabling is put in alterations will be expensive. You therefore owe it to yourself to find all about BT Galvanized Equipment now before you go ahead with the work.

Send the coupon. Also be sure to ask for valuable book "How to build a Dairy Barn" that tells how to lay cement floors and walls and how to frame the barn at half the cost of ordinary method. Sent free if you will answer the questions in the coupon.

THE HORSE.

Horse with Sore Shoulders.

I shall be obliged if you can give me any information as to what I can do to prevent the shoulders of a horse swelling occasionally. The horse is a heavy, high-set, powerful animal about 18 hands; he works mostly in cart, drawing trees, sometimes in chains, dragging the trees to the roadway for loading. In my opinion the swelling proceeds from the state of the blood. It seems very painful, and looks as if it were inflamed; sometimes, if these swellings are pressed, yellowish blood flows. It is not caused by a badly fitting collar, nor change of work. He seems a "tender-skinned," or sensitive-skinned, sort.—K. M.

Answer- When you describe the animal as "seems a tender, thin-skinned or sensitive-skinned sort," you sum up the position as neatly and concisely as it is possible to express it. There are some horses that are so prone to sore shoulders and backs that they are only to be kept working by the exercise of the greatest care, and then by constantly giving trouble. For the horse of this kind, timber-clearing is most trying work; indeed, it is trying work for the shoulders of any horse, because the draught is neither easy nor steady, and in pulling at a tree that does not come, or in starting a log, the horse throws himself into his collar with a force that is considerable, and means more or less bruising. What you have to decide is whether it wil, pay you best to quit the horse and find another less tender-skinned, and, therefore, better suited for your arduous work, or endeavour to keep the gnimal at the work by hardening the skin. Our experience is that there are few horses that have worked for long in a timber tug or at wood clearing but what gave evidence of, at some time or other, having suffered from sore shoulders, and given an animal of the "sort" you describe, there is pretty sure to be constant trouble. We have known cases in which such horses worked better in the patent steel collars than any other, for if hard, they are always cool, dry, and easily kept clean, but we should not like to venture to say that this collar would be suitable for your animal. A useful tip in these cases is, on return lrom work, to remove the hames, lift the collar to let the air under, and teen allow it to remain on until the shoulders are quite dry. Then wet the skin freely with an astringest lotion. An example is:—Powdered alum, 1 oz.;sulphuric acid, 1 drachm; water, 1½ pints. A useful lotion when the shaulders are tender is:—Acetate of lead, ½ oz.; sulphate of zinc, ½ oz.; rain water, 1½ pints.—M. R. C. V. S.

Management of the Pregnant Mare.

The mare in foal should be worked lightly or abundantly exercised every day. Exercise is absolutely necessary She should occupy a roomy box stall. Here she will take some additional exercise and will not be afraid to lie down. She will be less likely to become "cast" and escape having "stocked" legs and dropsical swellings of the udder and abdomen. The bedding should be kept clean and dry.

Feed the mare sound, whole oats, bran and mixed or timothy hay. Avoid mouldy hay or silage, damaged grain, woody weathered fodder, dusty or rusty straw, or hay containing ergot. Provide them with plenty of clean, pure water. In working mares, avoid jerking, severe pdlling, wading through deep mud or manure piles; let the work be light, easy and steady. Keep the bowels active by feeding bran and a little flaxseed meal, carrots, or some sweet silage.

The mare goes forty-eight weeks, or about 340 days, with foal. As foaling time approaches decrease the grain ration and increase laxative foods to keep the bowels acting freely. Constipation is dangerous. When wax forms on the teats, place her in a prepared box stall where she can be watched until the foal is born.

Hints on Grooming Horses.

The practice of washing horses, as a rule, is injurious, because it removes the natural oil from the outer skin and predispose the animal to chill, writes a practical man in the Kentucky Stock Farm. The application of water to a horse's skin increases the heat conducting power of his coat, and lowers the temperature of the surface by evaporation, and also by conduction, in the event of the temperature of the water being colder than that of the skin. Although in hot climates, like that of India, and in many parts with us, the horse may be washed with impunity, provided that he is quickly dried, I do not think such a proceeding is safe in temperate or cold countries. Even in the tropics, washing a horse always takes the gloss off his coat, no matter how vigorously the subsequent grooming may be performed. This fact is certainly a strong argument against the practice in question. If it is imperative to wash, and there is not sufficient help to have the horse rubbed dry, without loss of time, we may after scraping and going over him with two ot three dry rubbers, take him out and exercise him at a brisk pace until he gets dry. We should then walk him about uutil his circulation regains its normal condition before taking him in. If we can not give this exercise, we may, after a good supply of warm clothing, scraping and drying him, put on him bandage his legs, and leave him thus to dry under his rugs, which he will do in an hour or less. He should after that be exercised and well rubbed down, so as to prevent his getting chilled. A good plan for getting a horse to dry quickly and safely under clothing, is to cover the animal's back and loins with straw before putting on a rug, so as to utilize the low heat conducting power of air and to give as little impediment as possible for the escape of moisture.

Horsemen Attention!

Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Thier use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Glanders, Spavins, Pinkeye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Troubl, Fevers, Cuts, Sores and will remove bunches of all kinds

BEFORE USING

Why have a sick or lame horse, when you can get a reliable and warranted remedy? The leading horsemen of the Dominion endorse Dr. J. Woodbury's Horse Liniment.

Sold by dealers everywhere. Three sizes — 14 in., 17 in. and 20 in. wide.

DAVID MAXWELL & SONS - St. Mary's, Ont. 4

Water has no power to remove the scales which the outer skin gives off in the form of dandruff, its cleansing effect being confined to sweat, mud, dust and other kinds of adventitious dirt. The practice of washing horses often gives rise to cracked heels and mud fever, which is a form of inflammation of the skin that extends more or less over the legs and sometimes over the lower surface of the abdomen.

We find from expeience that the external application of warm water, especially to the legs, is even more objectionable than cold water. This is chiefly due to the fact that warm water more readily removes the oil which keeps the skin soft and pliable; and is more efficient in loosening layers of scales which serve to protect the true skin from irritation by external influence than cold water.

The expression, "hand-rubbing," is employed as a rule only in connection with the legs of the horse. The extension of this practice to the body of the animal, would make a great improvement in our grooming. It has the special advantage of being in no way irritating to the skin, and consequently it is seldom resented by the horse. I am of the opinion that it is a better stimulant to the skin than any other form of grooming. It is certainly the best means lor putting a gloss on the coat. The hand-rubbing of the body is carried out as follows: In hand-rubbing above the knees and hocks the stroke should be commenced by bringing the flat of the hand—each hand to be used alternately—well under the belly, down the forearm, thigh or gaskin, or between the fore-legs, as the care may be, and it should then be drawn up with an even and firm pressure. As the hand is raised, the elbow should be turned out and the under part of the bared forearm should be brought into play against the grain of the coat. In doing this the weight of the body and the strength of the arm should be utilized. $

The usual method adopted in hand-rubbing the legs below the knees and hocks is to kneel down or sit on one's hams by the side of the leg which is to be manipulated, and make alternate strokes downward while grasping the leg between the fingers and thumb. When on the near side the left hand is naturally placed on the front of the leg, and the right on the back of the leg. On the off side the position of the hands is of course reversed. The pressure exerted by the hands should be firm, but by no means irritating. The skin at the back of the pasterns should be well rubbed, so as to render it as dry and pliable as possible.

Hand-rubbing the legs is a beneficial practice with the generality of stabled horses. It prevents stagnation of the blood in the legs and feet; by the pressure exerted, it promotes the aborption of any effusions that may be present about the back tendons and suspensory ligaments and it helps to guard the skin against cracked heels and mud fever. Although this ordinary hand-rubbing is sufficient for grooming purposes, it is not nearly so effeceive in cases of sprain as the method of rubbing from the fetlock upwards while the limb is held on the ground.

Hand-rubbing the body helps to keep the coat short, which desirable effect is increased by dampening the palms of the hands in water. If this is done when hand-rubbing the legs, or if the legs be wet when hand-rubbed, their appearance, in the case of well-bred horses, is apt to be spoiled by patches of hair being removed owing to the moisture loosening the hairs. Hence the hands should be kept dry when the legs are being hand-rubbed, unless we want to diminish the amount of hair.

Gombault's Caustic Balsam

David Copperfield.

By Charles Dickens.

(Continued from last issue)

As the Doctor turned his kind face with its smile of simplicity and gentleness' towards her, she dropped her head more. I noticed that Mr. Wickfield looked at her steadily.

"When I happened to say to that naughty thing, the other day," pursued her mother,, shaking her head and her fan at her playfully, "that there was a family circumstance she might mention to you—indeed, I think, was bound to mention— she said, that to mention it was to ask a favor; and that, as you were to generous, and as for her to ask was always to have, she wouldn't."

"Annie, my dear," said the Doctor. "That was wrong. It robbed me of a pleasure."

"Almost the very words I said to her!" exclaimed her mother. "Now really, another time, when I know what she would tell you but for this reason, and won't.

"I shall be glad if you will," returned the Doctor.

"Shall I?"

"Certainly."

"Well, then, I will!" said the Old Soldier. "Taht's a bargain." And having, I suppose, carried her point, she tapped the Doctor's hand several times with her fan (which she kissed first), and returned triumphantly to her former station.

Some more company coming in, among whom were the two masters and Adams, the talk became general; and it naturally turned on Mr. Jack Maldon, and his voyage, and the country he was going to, and his various plans and prospects. He was to leave that night, after supper, in a postchaise, for Gravesend; where the ship, in which he was to make the voyage, lay; and he was gone—unless he came home on leave, or for his health—I don't know how many years. I recollect it was settled by general consent that India was quite a misrepresented country, and had nothing objectionable in it, but a tiger or two, and a little heat in the warm part of the day. For my own part, I looked on Mr. Jack Maldon as a modern Sinbadl and pictured him the bosom friend of all the Rajahs in the East sitting under canopies, smoking curly golden pipes—a mile long, if they could be straightened out.

Mrs. Strong was a very pretty singer as I knew, who often heard her singing by herself. But, whether she was afraid of singing before people, or was out of voice that evening, it was certain that she couldn't sing at all. She tried a duet, once, with her cousin Maldon, but could not so much as begin; and afterwards, when she tried to sing by herself, although she began sweetly, her voice died away on a sudden, and left her quite distressed, with her head hanging down over the keys. The good Doctor said she was nervous, and, to relieve her, proposed a round game at cards; of which he knew as much of the art of playing the trombone. But I remarked that the Old Soldier took him into custody directly, for her partner; and instructed him, as the first preliminary of imitation, to give her all the silver he had in his pocket.

We had a merry game, not made the less merry by the Doctor's mistakes, of which he committed a innumerable quantity, in spite of the watchfulness of the butterflies, and to their gay aggravation. Mrs. Strong had declined to play, on the ground of not feeling very well; and her cousin Maldon had excused himself because he had some packing to do. When he had done it, however, he returned, and they sat together, talking, on the sofa. From time to time she came and looked over the Doctor's hand, and told him what to play. She was very pale, as she bent over him, and I thought her finger trembled as she pointed out the cards; but the Doctor was quite happy in her attention, and took no notice of this, if it were so.

At supper, we were hardly so gay. Every one appeared to feel that a parting of that sort was an awkward thing, and that the nearer it approached, the more awkward it was.

Mr. Jack Maldon tried to be very talkative, but was not at his ease, and made matters worse. And they were not improved, as it appeared to me, that the Old Soldier: who con tinually recalled passages of Mr. Jack Maldon's youth.

The Doctor, however, who felt, I am sure, that he was making everybody happy, was well pleased, and had no suspicion but that we were all at the utmost height of enjoyment.

"Annie, my dear," said he, looking at his watch, and filling his glass. "it is past your cousin Jack's time, and we must not detain him, since time and tide—both concerned in this case—wait for no man. Mr. Jack Maldon, you have a long voyage and a strange country, before you; but many men have had both, and many men will have both, to the end of time. The winds you are going to tempt, have wafted thousands upon thousands to fortnne, and brought thousands upon thousands happily back."

"It's an effecting thing," said Mrs. Markleham, 'however it's viewed, it's affecting, to see a fine young man one has known from an infant, going away to the other end of the world, leaving all he knows behind, and not knowing whats before him. A young man really well deserves constant support and patronage," looking at the Doctor, who makes such sacrifices."

"Time will go fast with you Mr. Jack Maldon," pursued the Doctor, "and fast with all of us. Some of us can hardly expect, perhaps, in the natural course of things, to greet you at your return. The next best thing is to hope to do it, and that's my case. I shall not weary you with good advice. You have long had a good model before you, in your cousin Annie. Imitate her virtues as nearly as you can."

Mrs. Markleham fanned herself, and shook her head.

"Farewell, Mr. Jack," said the Doctor, standing up; on which we all stood up. "A prosperous voyage out, a thriving career abroad, and a happy return home!"

We all drank the toast, and all shook hands with Mr. Jack Maldon; after which he hastily took leave of the ladies who were there, and hurried to the door, where he was received, as he got into the chaise, with a tremendous broadside of cheers discharged by our boys, who had assembled on the lawn for the purpose. Running in among them to swell the ranks, I was very near the chaise when it rolled away; and I had a lively impression made upon me, in the midst of the noise and dust, of having seen Mr. Jack Maldon rattle past with an agitated face, and some thing cheery-colored in his hand.

After another broadside for the Doctor, and another for the Doctor's wife, the boys dispersed, and I went back into the house, where I found the guests all standing in a group about the Doctor, discussing how Mr. Jack Maldon had gone away and how he had borne it, and how he had felt it, and all the rest of it. In the midst of these remarks, Mrs. Markleham cried: "Where's Annie.

No Annie was there; and when they called to her, no Annie replied. But all pressed out of the room, in a crowd, to see what was the matter, we found her lying on the hall floor. There was great alarm at first, until it was found that she was in a swoon, and that the swoon was yielding to the usual means of recovery; when the Doctor, who had lifted her head upon his knee, put her curls aside with his hand, and said, looking around:

"Poor Annie! She's so faithful and tender-hearted! It's the parting from her old playfellow and friend, her favorite cousin, that has done this. Ah! It's a pity! I am very sorry!"

When she opened her eyes, and saw where she was, and that we were all standing about her, she arose with assistance: turning her head, as she did so, to lay it on the Doctor's shoulder—or to hide it, I don't know which. We went into the drawing-room, to leave her with the Doctor and her mother; but she said, it seemed, that she was better than she had been since morning, and that she would rather be brought among us; so they brought her in, looking very white and weak, I thought, and sat her on a sofa.

"Annie, my dear," said her mother, doing something to her dress. "See here! You have lost a bow. Will anybody be so good as find a ribbon; a cherry-colored ribbon?"

It was the one she had worn at her bosom. We all looked for it; I myself looked every where, I am certain: but nobody could find it.

"Do you recollect where you had it last, Annie?" said her mother.

I wondered how I could have thought she looked white, or anything but burning red, when she answered that she had had it safe, a little while ago, she thought, but it was not worth looking for.

Nevertheless it was looked for again, and still not found. She entreated that there might be no more searching; but it was still sought for in a desultory way, until she was quite well, and the company took their departure.

We walked very slowly home, Mr. Wickfield, Agnes, and I; Agnes and I admiring the moonlight, and Mr. Wickfield scarcely raising his eyes from the ground. When we, at last, reached our own door, Agnes discovered that she had left her little reticule behind. Delighted to be of any service to her, I ran back to fetch it.

I went into the supper-room where it had been left, which was deserted and dark. But a door of communication between that and the Doctor's study, where there was a light, being open, I passed on there, to say what I wanted, and to get a candle.

The Doctor was sitting in his easy-chair by the fireside, and his young wife was on a stool at his feet. The Doctor, with a complacent smile, was reading aloud some manuscript explanation or statement of a theory out of that interminable Dictionary, and she was looking up at him. But, with such a face as I never saw. It was so beautiful in its form, it was so ashy pale, it was so fixed in its abstraction, it was so full of wild, sleep-walking, dreamy horror of I don't know what. The eyes were wide open, and her brown hair fell in two rich clusters on her shoulders, and on her white dress, disordered by the want of the last ribbon. Distinctly as I recollect her look, I cannot say of what it was expressive. I cannot even say of what it is expres-

A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. Write to-day. Address: Mrs. M. Summers, Box. . 309 Windsor, Ont.

TORONTO WOMAN WELL AGAIN

Freed From Bearing Down Pains, Backache and Pain in Side by Lydia E. Pinkham's Compound.

Toronto, Ont.—"Last October, I wrote to you for advice as I was completely run down, had bearing down sensation in the lower part of bowels, backache, and pain in the side. I also suffered terribly from gas. I took Lydia E. Pinkham's VegetableCompound and am now entirely free from pain in back and bowels and am stronger in every way. I recommend Lydia E. Pinkham's Compound highly to all expectant mothers."—Mrs. E. WANDBY, 92 Logan Avenue, Toronto, Ontario.

Consider Well This Advice.

No woman suffering from any form of female troubles should lose hope until she has given Lydia E. Pinkham's Vegetable Compound a fair trial.

This famous remedy, the medicinal ingredients of which are derived from native roots and herbs, has for nearly forty years proved to be a most valuable tonic and invigorator of the female organism. Women residing in almost every city and town in the United States bear willing testimony to the wonderful virtue of Lydia E. Pinkham's Vegetable Compound.

If you have the slightest doubt that Lydia E. Pinkham's Vegetable Compound will help you, write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass., for advice. Your letter will be opened, read and answered by a woman, and held in strict confidence.

sive to me now, rising again before my older judgment. Penitence, humiliation, shame, pride, love and trustfulness, I see them all; and in them all, I see that horror of I don't know what.

My entrance, and my saying what I wanted, roused her. It disturbed her. It disturbed the Doctor too, for when I went back to replace the candle I had taken from the table, he was patting her head, in his fatherly way, and saying he was a merciless drone to let her tempt him into reading on; and he would have her go to bed.

But she asked him, in a rapid, urgent manner, to let her stay. To let her feel assured (I heard murmur some broken words to this effect) that she was in his confidence that night. And, as she turned again towards him, after glancing at me as I left the room and went out at the door, I saw her close her hands upon his knee, and look up at him with the same face, as he resumed his reading.

It made a great impression on me, and I remembered it a long time afterwards as I shall occasion to narrate when the time comes.

CHAPTER XVII.

Somebody Turns up.

It has not occurred to me to mention Peggotty since I ran away; but of course, I wrote her a letter almost as soon as I was housed at Dover, and another and a longer letter, containing all particulars fully related, when my aunt took me formally under her protection. On my being settled at Doctor Srrong's I wrote to her again, detailing my happy condition and prospects. I never could have derived anything like the pleasure from spending the money, Mr. Dick had given me, that I felt in sending a gold half-guinea to Peggotty, per post, inclosed in this last letter, to discharge the sum I had borrowed of her: in which epistle, not before, I mentioned about the young man with the donkey-cart.

To these communications Peggotty replied as promptly, if not as concisely, as a merchants clerk. Her utmost powers of expression (which were certainly not great in ink) were exhausted in the attempt to write what she felt on the subject of my journey. Four sides of incoherent and interjectional beginnings of sentences that had no end, except blots, were in adequate to afford her any relief. But the blots were more expressive to me than the best composition; for they showed me that Peggotty had been crying all over the paper; and what could I have desired more?

I made out, without much difficulty that she would not take quite kindly just yet. The notice was too short after so long a prepossession the other way. We never new a person, she wrote; but to thimk that Miss Betsey should seem to be so different from what she had been thought to be, was a Moral! That was her word. She was evidently still afraid of Miss Betsey, for she sent her grateful dutv to her but timidly; and she was evidently afraid of me, too, and entertained the probablity of my running awav again soon:if I might judge from the repeated hints she threw out, that the coach-fare to Yarmouth was always to be had of her for the asking.

She gave me a piece of intelligence which affected me very much, namely, that there had been a sale of the furniture at our old home, and that away, and the house was shut up, to Mr. and Miss Murdstone were gone away, and the house was shut up, to be let or sold. God knows I had no part in it while they remained there, but it pained me to think of the dear place as altogether abandoned; of the weeds growing tall in the garden, and the fallen leaves lying thick and wet upon the paths. I imagined how the winds of winter would howl around it, how the cold-rain would beat upon the window-glass, how the moon would make ghosts on the wall of the empty rooms, watching their solitude at nights. I thought afresh of the grave in the churchyard, underneath the tree: and it seemed as if the house were dead too, now, and all connected with my father and mother were faded away.

There was no other news in Peggotty's letters. Mr. Barkis was an excellent husband, she said, though still a little near; but we all had our faults, and she had plenty (though I am sure I don't know what they were); and he sent his duty, and my little bedroom was always ready for me. Mr. Peggotty was well, and Ham was well, and Mrs. Gumbridge was but poorly, and little Em'ly wouldn't send her love, but said that Peggotty might send it, if she liked.

All this intelligence I dutifully imparted to my aunt, only reserving to myself the mention of little Em'ly, to whom I instinctively felt that she would not very tenderly incline. While I was yet new at Doctor Strong's, she made several excursions over to Canterbury to see me, and always at unreasonable hours: with the view, I suppose, of taking me by surprise. But, finding me well employed, and bearing a good character, and bearing on all hands that I rose fast in the school; she soon discontinued thses visits. I saw her on a Saturday, every third or fourth week, when I went over to Dover for

a treat; and I saw Mr. Dick every alternate Wednesday, when he arrived by stage-coach at noon, to stay until next morning.

(Continued in next issue)

Weighing the Baby as a Health Precaution.

One of the best indicators of a baby's health progress is its increase in weight. A normal baby must not necessarily gain weight rapidly, but he should gain regularly. Stationaryy weight, or loss of weight for any length of time, is a danger signal, and means that there is a disturbance of nutrition, or some disease brewing. This in turn calls for immediate medical advice and attention, before the abnormal process is to far advanced.

A normal child at birth weighs on an average six and a half to seven or seven and a half, perhaps eight pounds. Nine and ten pound babies are occasionally born, but they are exceptional. The fifteen and twenty pound babies at birth, that so many take delight in talking about, are medical curiosities, or more frequently myths.

The tendency of modern medicine is to so modify and regulate the mother's diet during pregancy that in so far as it is possible, a child only of moderate size is born. This is in line with the advanced thought of the maximum safety at birth for mother and child. I have said that a steady increase is necessary. Failure to so increase means improper feeding of disease.

In all matters relative to the baby's condition written information should be kept, more particular with reference to its weight. A mother's memory, because of her great anxiety to do the right thing, is apt to be imperfect and unreliable. Therefore, I never rely upon giving verbal instructions, nor in asking the mother to keep a history of the child's progress in her mind. Written information on the part of the doctor and the mother, nurse or attendant, is absolutely essential for the sake of the child.

IT'S PROGRESS THAT COUNTS.

I want to sound a note of warning against the mother judging her baby's progress by comparison of his weight with that of the baby of a neighbor, friend or relative. Remember, that even if your child appears to suffer by comparison, he may still be the healthy one. How often have I had a mother hurry to me, worried and excited, because Doctor So and So's book states that a child of a given age should weigh sixteen pounds, and to her great dismay she found that morning her child's weight to be only fifteen pounds and eight ounces. This mother forgets, as so many of you do, that it is not the weight alone at any period which must be considered, but the nature of its progression and its relation to the initial weight at birth. Let me illustrate by example:

The normal child at the end of its first year should weigh about nineteen to twenty pounds; that is, should about triple its weight at birth; and yet a child weighing five and a half pounds at birth and seventeen to twenty-eight pounds at the end of the first year, has progressed as well and better than a child who weighs nineteen to twenty pounds at the end of the first year, and weighed seven and a half or eight pounds at birth.

Make the individual progress of your own baby your concern, and avoid any and all comparisons. No two babies gain in weight exactly in the same way, whether they be bottled fed or breast-fed. As a rule

The Next Time a Cold Strikes You—

Strike Back! Don't submit meekly—don't let it wear you down and keep you miserable for two or three weeks. Knock it out at once with a few doses of

NA-DRU-CO

Syrup of Linseed, Licorice and Chlorodyne

This splendid household remedy is pleasant to take—absolutely safe—quickly in action—sure in results. It gives immediate relief from coughs, colds, bronchitis, hoarseness, loss of voice, pains in the chest or any similar throat or lung trouble.

Special Advice For Men

Vitality Restored by New Method

The attached coupon entitles you to one illustrated copy of my pocket compendium and guide for the self-restoration of lost strength. (See description below) Upon hearing from you, this valuable little book of private information for men will be sent by return mail in plain sealed envelope. Please call or write today.

There is a new and marvelous method for restoring lost manly strength, for renewing the vigor of youth, which every man should know of, a self-restorer which operates without the use of drugs or medicines, a new way to treat yourself and by which it is my firm belief any man anywhere who is content to lead a decent life, free from excesses and dissipations may be almost certain to restore his full manly vigor snd strength, if he but makes the little effort that is called for in connection with the use of a little vitalizing appliance which I have patented and am now distributing all over the world.

Please remember that a man is not one day older than he actually feels, and therefore no matter what your age, if you are young or elderly, married or single, large or small, if I can show you reader, how you can yourself actually add to your system, nerves and blood the very nerve force or vital vigor which may have been drained away, and which is necessary to make you strong, vigorous, and capable again, then I have shown you the real secret of perpetual youth, and how you can again be filled with vitality and again be just as powerful in your influence and just as thoroughly manly in your capacity as the biggest fullest blooded, most successul fellow of your acquaintance.

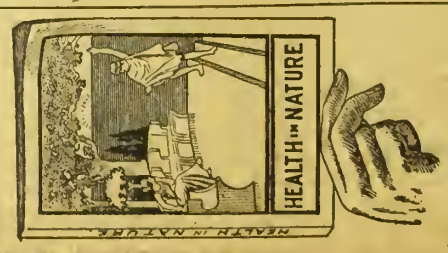
HEALTH IS HAPPINESS

I call my vitalizer a HEALTH BELT because it is worn around your body in the position of an ordinary belt. It sends a great, soft, strength-giving supply of a force call vitality into your body nights while you sleep. I would like you to call or to write and get my free book, that you may know the whole wonderful account of what my HEALTH BELT is doing for others who were looking for a safe and sure means to restore vigorous health and to rid the body of pains, aches and weaknesses.

Note—My HEALTH BELT, with special attachment, is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, etc.

86-PAGE BOOK SENT FREE

My 86- page illustrated booklet (pocket size) was compiled by me to answer fully and correctly those questions which are asked privately by any man needing new strength and who seeks personal advice pertaining to the ailments and weaknesses he wishes to overcome. The book, fully illustrated, with photo reproductions contains much that every single or married man should know. It also fully describes my HEALTH BELT and tells how you may secure one to use in your own case, should you decide you want to use one. Remember the book is sent absolutely free, in plain, sealed envelope. Why not write for a copy today?



DR. M. F. SANDEN,
140 Yonge St., Toronto, Ont.

breast-fed babies gain more rapidly, and the weekly increase is greater than with the bottle fed babies, but this is not always the case. Usually the increase in weight is most rapid during the first three months, and slowest from the sixth to the ninth.

A baby placed on carefully regulated and prepared bottle feeding will gain better than one on imperfect or insufficient breast feeding. When the weight of a breast-fed baby remains stationary or declines, it is a signal for the addition or substitution of artificial feeding. I say this because, while I am an ardent advocate of breast feeding, and never advise its discontinuance unless absolutely forced to no so—a rarity at best—I am not blind to the fact that occasionally it must be supplemented by artificial feeding.

You will not find that the same baby gains the same amount every week. There are all gradations, within normal limits, depending upon the nutrition of the mother, the season of the year, the inclination of the infant dentition, and the condition of the bowels and the nature of the movement.

And now, how much should the baby gain? The normal infant should gain on the average about one pound a month, three and three-quarters to four ounces weekly. During the first two or three days after birth some infants, not all, lose five to six ounces in weight, because the exhalations from the skin and lungs, the passage of urine and evacuation of the bowels exceed the small amount of nourishment taken. In breast feeding, little, if any nourishment is ready until the second or third day. By the end of the seventh or eighth day the orginal weight is usually regained. There may be weeks in which baby will gain only three to three and a half ounces, and other weeks where the gain may be six, seven or ten ounces. He should about double his initial birth weight at the sixth month, and about triple it at the end of the first year.

A small gain for a week or two—two or three ounces weekly—nced cause no alarm, but requires careful watching. I believe that if the weight is stationary for two weeks, something is wrong, either with the food or the child. In cases of difficult weaning, where the child often refused food for days at a time, a loss of a pound or more may be recorded. And after an attack of diarrhea or bronchitis I have seen a decline in weight to the extent of a pound and more.

When and how soould the baby be weighed? Unless some special indicator calls for it, weighing once a week is sufficient. Where difficulty in feeding is encountered, or if the child is feeble, twice weekly or more frequently may be necessary. The more delicate the child is at birth, the greater must be the frequency and analysis of the weighing. In order to establish the amount of breast feeding taken by the infant, sometimes weighing before and after nursing may have to be done.

Weighing must take place under the same conditions and at the same time of the day. The child should be naked and placed in the scales before the morning bath. If the child was weighed one week before the first daily evacuation of the bowels, it must not be weighed the week following after the bowel evacuation, as it is easily seen that this will make a difference of several ounces and produce false conclusions. The same applies to weighing before or after nursing, or the feeding. Nor must it be weighed after the bath one week and before the bath a week after. It is, of course, understood that the room is of the proper temperature. If it becomes necessary to keep same clothing on, its weight should be deducted.

To procure a reliable weight data, a satisfactory scale is necessary. The same scale properly adjusted must be used every week. To weigh a child in your scales today and in a neighbor's tomorrow, is borrowing trouble—and unreliability. Hand scales, used by some physicians at birth, are worse than useless and can be made to weigh almost as you like it, to say nothing of the disagrecable sight of the youngster dangling in the air. It must no be gathered, however, that expensive and elaborate scales are necessary. The ordinary bathroom scales, which are also used for older children, are parctical and reliable. In these the child can move and kick as it will without interfering with the reading. A napkin or pad should be placed in the scale and its weight deducted from the reading.

The weight having been noted it must be recorded temporarily on a sheet of paper at hand and then transcribed to the weight chart, baby book, or other record especially set aside for that purpose. The chart should be posted in the nursery over

NEW COAL OIL LIGHT BEATS ELECTRIC OR GASOLINE

10 Days FREE—Send No Money

We don't ask you to pay us a cent until you have used this wonderful modern light in your own home for ten days, then you may return it at our expense if not perfectly satisfied. We want you to prove for yourself that it gives five to fifteen times as much light as the ordinary oil lamp; beats electric, gasoline or acetylene. Lights and is put out just like the old oil lamp;

BURNS 70 HOURS ON 1 GALLON OIL

Gives a powerful white light, burns common coal oil (kerosene), no odor, smoke or noise, simple, clean, won't explode. Guaranteed.

$1000.00 Reward

will be given to the person who shows us an oil lamp equal to this Aladdin in every way (details of offer given in our circular). Would we dare make such a challenge to the world if there was the slightest doubt as to the merits of the Aladdin? We want one person in each locality to whom we can refer customers. Write quick for our 10 Day Absolutely Free Trial Proposition, Agents' Wholesale Prices, and learn how to get ONE FREE.

AGENTS WANTED

to demonstrate in territory where oil lamps are in use. Experience unnecessary. Many agents average five sales a day and make $300.00 per month. One farmer cleared over $800.00 in 6 weeks. You can make money evenings and spare time. Write quick for territory and sample.

the place where the bath is given, a ready reminder to the mother and nurse to keep a written record of weight.

Recording the weekly weighing in columns by weeks may be used. I tell my patients that when the weight of the child is stationary or declines, to note the figures for that week in red ink. By this means I have often, as I entered the nursery, known the reason for the call. Likewise, on the chart I ask them to note these unfavorable changes in red ink.

You would call it unbusinesslike if you kept no account of your income and expenditures. There is no household consideration more important for you than the healt of your baby, and in the keeping of a systematic record of your child's weight progress you are noting whether it is adding progressively to its original weight capital—his health income—or whether because of faulty nutrition or disease processes his weight is on the decline—whether his health expenditures are reaching a point where you must call a halt.

Your Little Ones.

If your children are thin and scrawny and take cold easily, give them from a teaspoon to a tablespoon pure olive oil after each meal. Give them a pinch of salt as soon as they have swallowed the olive oil, and no taste of the oil will remain in the mouth. A tiny bit of pure sweet chocolate may also be given them as a reward for taking the oil. It has the advantage of being nutritious, and so supplements the work of the olive oil.

It is sometimes dangerous to use a hot water bag for children. Here is a good substitute: Make a strong bag linen or denim and fill with good, clean sand. Heat thoroughly in oven and then slip in another bag of flannel. This retains the heat a long time.—E. E. K., Mass.

Parched corn is an excellent remedy for dysentery, diarrhea and bowel complaints in children. Parch some corn, then grind in a fine coffee grinder. Boil in sweetened and salted milk and feed to the patient. It is a palatable and healthy food and generally relished by the children. Let them eat as much of it as they please.—B. E., Oregon.

FLORICULTURE.

Many inquiries are made as to the best treatment for frosted plants. Tender tropical and subtropical plants will seldom recover if frozen, but the more hardy classes of plants if prompt care is given them, may be saved, although the check given them often makes them feeble for a long time.

When you have plants frozen, plunge them at once in cold water and let them remain there until all frost is removed. Then place them in a dark, cool, frost-free position for at least two days, after which cut out all badly frosted wood, even back to the crown of the plant is necessary. Keep plant out of the sunlight but give strong light and keep on the dry side until new growth is coming when the plant can be treated as usual.

Early potted Dutch Hyacinths and Narcissus can now be brought to light for early forcing but should be kept cool as heat at this season with these classes of bulbs mean a weak flower stalk and poor color of bloom. Lily of the Valley crowns or pips on the other hand need 75 to 80 degrees to force well and frequent spraying as well. At this temperature they can be had in bloom in about thirty days

Do not feed any except heavily root bound plants at this season as the results would be sour soil and attenuated growth.

A pot of sweet peas started now will give you bloom in the early spring; but the foliage must be sprayed or the red spider will ruin it.

Look after any dormant plants that have been placed away to rest in winter. If from any cause you find a plant starting growth you had better bring it to light and let it grow; otherwise you may lose it. Water lightly any plants that will not bear wholly drying out.

If you wish early-blooming Gloxinias, you can start dormant tubers into growth by placing them in moist sand in a warm situation leaving the crown of the tuber just above the surface of the sand. When new roots and top growth appear, pot them in small pots in a rich light soil with through drainage. Water lightly until good root and top growth has been made then keep from drying out. Repot them as often as this ball of soil is filled with roots in one size larger pots. Tubrous Begonias can also be started in the same way.

Moncton Correspondent writes:—When should seeds of Pansies, Verbenas and Asters be planted for early plants for the garden? I have a large window in spare room that faced the south. While it never freezes in this room there is no means of heating it beyond an open door. Would it be a safe place for the young plants? I had some bulbs of Roman Hyacinths that were placed in the cellar to root during the cold spell in December. They look well but do not seem to grow, the green sprout seem just like the same size it was when it was first brought to the light. How should it be treated?

Regarding the time to sow the seeds of the annuals named I would think that the twentieth of February would be as early as the seeds could be safely planted in the house. The room spoken of would be an excellent place for young plants when transplanted but the seed boxes should have a place where an even temperature of say 50 degrees could be kept. Freezing is apt to be fatal to Roman Hyacinths bulbs. I am afraid that nothing can be done to save them now. The chances are that the bulbs are beginning to decay.

A Flower Lover, St. John, writes:—I have a large Azalia that was in bloom Easter last year. It grew nicely all summer and kept quite green during the fall and early winter although it has lost some of its leaves. It is now covered with buds and an occasional bloom comes out.

How should it be treated to bring all the flowers out at once? Could it be kept back until Easter and if so how?

Place the Azalia in a warm sunny window and spray or sprinkle the buds and foliage every fine day until they show color. Water the plant freely and see that the drainage is good. If the buds are beginning to develop it certainly could not be kept back until Easter.

Mrs. J. L. O., Sydney St., writes:—I have a fern commonly called the Australian Fern. The leaves look brown and shabby and on the main stalk in the centre of the leaf little fernlike growths are coming. If these leaves were planted would they grow?

I imagine from the above description that the fern is the Polysticiums Paoliferuma variety of fern that is easily grown and propagates itself from the midrib of the leaf. If the leaf is cut off and fastened firmly to the soil of a pot with a couple of common hair pins it will take root at each of the little knobs and after the roots are one and one-half inches long it can be cut into little separate plants and each potted. The soil used should at least be half clean, fresh water sand and be kept constantly moistened. A small wooden box is better than a pot for this purpose if it is carefully looked after.

R. P O., St. John, writes:—Please tell me how to repot a large Rubber Plant that is growing in a pot twelve inches in diameter. The plant reaches to the ceiling now and there is not room to lift it to take the old pot away. How should the soil be put in? I have part of a small cask prepared with handles on it. Should there be holes in the bottom also? What can I grow in soil to cover edges of tub that will not injure the Rubber Plant?

The tub or half cask should have at least eight half inch holes in the bottom to make good drainage. Cover the bottom of the tub with broken flower pots or something of the kind so the holes will be well covered. On these place an inch or two of good soil. Break the pot leaving the ball of roots exposed and undisturbed. By lifting the roots sideways the tub can be slipped under it. Then fill in around the ball with rich soil packing it in firmly and the plant is repotted. Water thoroughly when work is completed and more sparingly afterward.

The common Green Tradescantia sometimes called Wandering Jew will be as little liable to injure the Rubber plant as anything I know. It is easily grown and requires about the same moisture as the Rubber Plant.

Fredericton, N. B., writes:—I have two plants of Easter Lilies. They are about eighteen inches high and in bud. The foliage has been curled and spotted for sometime, but now the lower ones are drying up and I am afraid the plants are going to die. They have been well watered and kept in a warm place. What treatment should they be given to remedy the trouble?

The lilies are infected with the Bermuda Lily Disease and there is no known remedy. They will probably be of little value to you as you will find that it gets worse as the plant develops.

Ferns from Sydney, C. B.—No. 1 is Asparagus Spungerie. No. 4 is Polysticlum Vulgari. No. 5.—Secularum Secutarum. They are all good house plants. Asparagus Spungeri makes a pretty trailing plant for a hanging pot.

A. H. G., St. John, writes:—Small brown spots a little larger than a pin head are appearing on the leaves of my Palm. Can you please tell me the cause?

The spots are probably scale insects. Try washing the foliage on both upper and under sides with castile soap suds using a soft brush or sponge, a brush is preferable. Rub hard enough to remove the scales without injuring the film of the leaves. There is a sort of fungus growth that appears sometimes in a weak palm but the spots are on both sides of the leaf, whereas insects are generally on the under part of the leaves. If you have any doubt about this send me a specimen of the trouble to Sussex Green House, H. E. Goold, Sussex, N. B.

Fertilizing Hoed Crops

Hoed crops are of primary importance to the general farmer and to stockmen as they constitute a large portion of the winter feed for stock.

Hoed crops draw heavily on the soil for their nourishment. To produce good, healthy crops a farmer should ensure to his corn and roots an available supply of the essential plant foods, sufficient for the crops' requirements.

POTASH is an essential Plant Food. No crop will be a good crop unless the soil contains sufficient for its needs. POTASH increases QUANTITY, improves QUALITY, promotes MATURITY.

MURIATE OF POTASH

AND

SULPHATE OF POTASH

can be obtained from the leading fertilizer dealers and seedsmen. "Fertilizing Hoed Crops" is the title of a a new bulletin published by the German Potash Syndicate, and can be obtained, FREE, on application together with any of the publications mentioned below.

We are prepared to send our Representatives to address Agricultnral aud Horticultnral Clubs and Farmers Institutes on "THE FERTILIZING OF CROPS" and "THE RATIONABLE USE OF FERTILIZERS."

Secretaries of Clubs and Institutes are invited to correspond with us to arrange suitable dates for Addresses.

The publications referred to above are:

"Artificial Fertiltzers, Their Nature and Use."

"The Potato Crop in Canada."

"Fertilizing Grain and Grasses."

"Fertilizing Orchard and Garden."

"Principal Potash Crops of Canada."

"Farmer's Companion," etc.

Maritime Stock Breeders in Annual Session.

The annual meeting of the Maritime Stock Breeders' Association was held in the N. S. A. C., Truro, N. S., on Wednesday, 14th inst.

Col. H. Montgomery-Campbell, President of the Association, occupied the chair, and a representative number of the stock breeders of Nova Scotia, New Brunswick and Prince Edward Island were present.

After the confirming of the minutes of the previous annual meeting and meetings since held, Secretary Fuller read a statement of the receipts and expenditures in connection with the 1913 Maritime Horse Show and Maritime Winter Fair.

The question of an alleged attempt at fraud by one of the contestants in the recent Maritime Winter Fair dairy tests was brought up for discussion. The matter had been brought to the attention of the Canadian Ayrshire Breeders' Association who had returned the data for the final decision of the annual meeting of the Maritime Stock Breeders' Association after which the Ayrshire Breeders' Association will render their verdict.

The following resolution was carried unanimously:

Whereas, at the Maritime Winter Fair, recently held in Amherst it was alleged that dishonesty was practised by one of the exhibitors in the dairy test by attempting to milk one of his cows in a pail in which a small quantity of cream had been placed,

Therefore resolved that the directors of the Maritime Stock Breeders' Association make a fuller investigation before a full meeting of the board and submit their findings to the Canadian Ayrshire Breeders' Association.

Dr. Torrens, Vet. Director Gen. for Canada came before the stock breeders for a few minutes during which he gave a short, concise discourse on Bovine Tuberculosis which was well taken by his audience.

The following directors were elected for the current year:—

For New Brunswick—A. E. Trites, Salsbury; R. A. Snowball, Chatham; W. W. Hubbard, Fredericton and M. A. Scovil, Gagetown.

For Prince Edward Island—Hon. M. McKinnon, Charlottetown; W. M. Lea, Victoria; J. F. Roper, Charlottetown and J. M. Laird, Kelvin Grove.

For Nova Scotia—C. A. Archibald, Truro; W. W. Black, Amherst; S. A. Logan, Amherst Point and R. S. Starr, Port Wi,liams.
